INTRODUCTION

Medieval Italy: An Encyclopedia provides an introduction to the many and diverse facets of Italian civilization from the late Roman empire to the end of the fourteenth century. To speak of "Italy" is, of course, anachronistic—a geographical rather than a political designation—given that Italy did not become a nation until the second half of the nineteenth century. Nevertheless, the idea of "Italy" was present in the mind of Dante and Petrarch and many others who longed for the peace and stability that they presumed and hoped a nation-state would provide. The two volumes of this encyclopedia present articles, both long and short, on a wide range of topics that concern the civilization of medieval Italy: history, literature, art, music, urban development, commerce and economics, social and political institutions, religion and hagiography, philosophy, science, and so on. We have attempted to bring together in one convenient reference work all these aspects of Italian civilization; however, given the vastness and the complexity of the subject matter, we make no claim for completeness. We hope to have provided a well-balanced, informative, and up-to-date reference work that will serve the interests of students and the general public, as well as those of scholars in a variety of disciplines.

The entries in this encyclopedia range in length from about 100 words to more than 10,000. Shorter entries usually treat very specific topics; longer entries are intended to trace the history and development of individual cities and to explain and interpret major institutions, writers and works, cultural movements, and monuments. As much as possible, we have tried to provide an interdisciplinary focus, for that sort of integrative approach not only will make a topic more accessible to a larger audience but also will enable readers to see relationships and connections that might not be immediately apparent. Although scholars will generally be familiar with the basic information and bibliographies found in those articles in their own areas of expertise, they should find articles in other areas valuable for critical orientation, interpretation, and bibliography. The analytical index at the end of Volume 2 and the cross-references at the end of most articles will serve as indispensable

aids to using the work.

Entries are arranged alphabetically, and individual entry titles are in either English or Italian, depending on what we considered the more common usage. The works of a specific author are usually discussed in the entry devoted to that author, although some general entries (e.g., Italian Poetry: Lyric) discuss in a chronological, topical, or synthetic way numerous authors, each of whom has a separate entry. Some problems emerged in the alphabetizing of personal names, and some inconsistencies may have been unavoidable. The guiding principle has been to list the person under the name that would be most natural or most familiar to most readers; thus Dante Alighieri is listed under D and Cino da Pistoia under C, while Giovanni Boccaccio is found under B and Guido Cavalcanti under C; Peter Damian is found under D, but Peter Lombard is listed under P. The bibliographies were prepared for specialists and nonspecialists alike and include, when appropriate, indications of primary sources (editions), translations, and a wide variety of secondary sources and critical studies, all of which provide a wealth of material for further reading and study. This encyclopedia also includes maps, illustrations for many entries, and an appendix listing popes and rulers.

ACKNOWLEDGMENTS

A work of this size (almost 1,000 entries) requires the cooperation and collaboration of many persons, and over the years—too many years, I should probably add, and our contributors will undoubtedly agree—I have accumulated many debts. I am very grateful to the many colleagues (192 in all) who gave generously of their time and expertise to write the articles that make up these two volumes. Their names are listed both at the beginning of the encyclopedia and after each of their entries. In particular, I thank my associate editors—John Barker, Gail Geiger, and Richard Lansing—who have provided invaluable assistance in the recruiting of contributors, in the editing of their articles, and in the writing of original entries for the encyclopedia. I also thank those colleagues who provided photographs: John Barker, Teresa Gualtieri Clarke, Gail Geiger, and Richard Lansing. I am very grateful to Lou Jordan and his staff (in particular, Christian Du Pont and Sara Weber) in the Department of Special Collections for placing at my disposal their very rich holdings during my several photographic expeditions to the Hesburgh Library at the University of Notre Dame. I am similarly indebted to the former and present curators—Robin Rider and Geraldine Laudati—of the Department of Special Collections of Memorial Library, University of Wisconsin-Madison, for allowing me to take photographs of materials in their wonderful collection.

Work on the encyclopedia began with the encouragement and sure guidance of Gary Kuris at Garland Publishing and proceeded under the editorial supervision of Marianne Lown, Joanne Daniels, and Richard Steins. Most recently the project has benefited enormously from the support of Sylvia Miller and the expert editorial hand of Susan Gamer and their many assistants at Routledge. On a more personal note, I owe more than words can say to the support always generously given me by my wife Marge and our sons Steven and Michael, who can now, I believe, breathe a great sigh of relief, in the knowledge that this project is indeed truly and finally done. It is to them, for their love of Italy both medieval and modern, that I dedicate these volumes.

Publisher's Note

The Routledge Encyclopedias of the Middle Ages

Formerly the Garland Encyclopedias of the Middle Ages, this comprehensive series began in 1993 with the publication of *Medieval Scandinavia*. A major enterprise in medieval scholarship, the series brings the expertise of scholars specializing in myriad aspects of the medieval world together in a reference source accessible to students and the general public as well as to historians and scholars in related fields. Each volume focuses on a geographical area or theme important to medieval studies and is edited by a specialist in that field, who has called on a board of consulting or associate editors to establish the list of articles and review the articles. Each article is contributed by a scholar and, typically, is followed by a bibliography and cross-references to guide further research.

Routledge is proud to carry on the tradition established by the first volumes in this important series. As the series continues to grow, we hope that it will provide the most comprehensive and detailed view of the medieval world in all its aspects ever presented in encyclopedia form.

Vol. 1 *Medieval Scandinavia: An Encyclopedia*. Edited by Phillip Pulsiano.

Vol. 2 *Medieval France: An Encyclopedia*. Edited by William W. Kibler and Grover A. Zinn.

Vol. 3 *Medieval England: An Encyclopedia*. Edited by Paul E. Szarmach, M. Teresa Tavormin, and Joel T. Rosenthal.

Acciaiuoli Family

The Acciaiuoli, a great Florentine banking family, originated in Bergamo. They migrated to the Borgo Santi Apostoli, in the Florentine quarter of Santa Maria Novella, in the early twelfth century and obtained property in the Val di Pesa. The Acciaiuoli were *popolani* ("of the common people") and Guelf by political tradition, and they joined the Black Guelfs after the schism. Leone di Riccomanno, a doctor of law and one of Florence's fourteen *buoniuomini* of 1282, founded the bank and international commercial enterprise that soon ranked among the city's greatest. These businesses had branches throughout the Mediterranean and in England, France, and Germany. The Acciaiuoli served as papal bankers, and Acciaiuolo Acciaiuoli (d. 1341) began a fiscal and political relationship with the king of Naples that led to commercial monopolies, the post of seneschal for his famous son Niccolo (or Niccola, 1310-1365), and feudal lordships in Greece that the family finally lost in 1460 to the invading Turks. Angelo Acciaiuoli (1349-1408) rose quickly in the church to become bishop of Rapallo (1375), bishop of Florence (1383), and a cardinal (1385).

The bankruptcies of Edward III of England led to financial disaster for the family in Florence in 1345, and their fortunes and prestige never fully recovered, although they remained influential in the later trecento. Before that, however, they had been very active politically. Between 1282 and 1341, the family contributed seven standard-bearers of justice and five *buoniuomini* to the Florentine state and three consuls to the Calimala guild. From 1310 to 1342, family members served in the Signoria twenty-five times; Dardano di Tirigo (d. 1335), for one, was elected ten times between 1302 and 1334. Angelo Acciaiuoli (b. 1298) was bishop of Florence from 1342 to 1355 and was a leader in the overthrow of Walter of Brienne.

Acciaiuoli, Niccola

The Florentine Niccola Acciaiuoli (1310-1365), a friend of Boc-caccio, became grand seneschal of the kingdom of Naples. Although writers sometimes refer to him as Niccolò, he himself used the spelling Niccola. He was born in the Val di Pesa to Acciaiolo Acciaiuoli and Guglielmina de' Pazzi. Although his father was of illegitimate birth, the Acciaiuoli, a family of Black Guelfs, were one of the most prominent lineages in Florence, with thriving commercial interests throughout the Mediterranean.

At eighteen, Niccola Acciaiuoli married Margherita degli Spini, and

in 1331 he was sent to represent his father's business in Naples. He entered the service of Catherine of Valois-Courtenay, princess of Taranto; became her lover; and was sent to administer her lands in Greece (1338-1341), where he won for himself the barony of Calamata. After the death of King Robert of Naples, Acciaiuoli arranged the marriage of Prince Luigi of Taranto to Queen Giovanna, possibly after assisting in the assassination of Giovanna's first husband, Andrew of Hungary. In 1348, Acciaiuoli was named grand seneschal ("grand" to distinguish him from other seneschals) and count of Terlizzi; and, after Giovanna's flight to Provence and return to Naples, he helped Luigi to establish control over the kingdom. In 1349, he traded Terlizzi for the county of Melfi and was also named captain general of the duchy of Calabria. An unsuccessful attempt on his life by followers of the queen in 1350 was followed by the liberation of Giovanna by the Marseillais. Giovanna and her husband were being taken back to Provence when Acciaiuoli engineered their return. This proved definitive, and it put an end to the resistance of the queen's partisans. With Luigi of Taranto the sole holder of power, the grand seneschal in effect ran the kingdom. In 1354, he took back most of Sicily, although Messina resisted until 1356 and Catania held out successfully. Luigi of Taranto's defeat at the battle of Arcireale (20 June 1357) was unfairly blamed on Acciaiuoli by his enemies, but in 1359 Acciaiuoli was sent on a successful embassy to defend the kingdom against the claims to papal sovereignty that were being made by Pope Innocent VI. Innocent chose Acciaiuoli to negotiate the departure of the Milanese from Bologna in 1360, when he met Petrarch in Milan. Acciaiuoli returned to Naples in 1361 to find the kingdom threatened by marauding mercenary captains. Although he showed considerable personal bravery in surmounting this crisis—at one point he gave himself, his children, and his friends as hostages to a company of Hungarian mercenaries—Acciaiuoli continued to have enemies at court. In 1364, they accused him before Pope Urban V of having taken so many gifts that there was no money to make the usual payments to the papacy. The charges prompted Acciaiuoli to write a long autobiographical letter defending his actions to Angelo Soderini (26 December 1364).

Acciaiuoli died on 8 November 1365. His body was buried in a splendid tomb (attributed to Orcagna) in the Carthusian monastery of

San Lorenzo (known today simply as the Certosa) outside Florence, whose construction he had sponsored after first mentioning it in an early autograph testament of 1338.

Accursius

Many biographical details are in dispute regarding the greatest medieval glossator of Roman law. Accursius (also Acursius, Accurxius, or Acurxius; c. 1182-c. 1263) was born at Bagnoio near Montebuoni in the *contado* (district) of Florence to a family in modest social circumstances, perhaps even of recent peasant origin, that was nevertheless economically secure enough to pay for his legal education at the university in Bologna. Two brothers are mentioned in the sources: Bonus (or Donus, a notary) and Bonajutus. Accursius was also known as A. Fiorentino or A. da Bagnoio, but the sometimes alleged forename Francesco is without historical foundation. In a *Digesta* gloss he later jestingly explained "that it is an apposite name, because he [Accursius] hurries forward and assists against the darkness of civil law" (*quod est honestum nomen, dictum quia accurrit et succurrit contra tenebras iuris civilis*).

In Bologna, he studied mainly under the great jurist Azo; Jacobus Balduini was perhaps another of his chief teachers, a supposition that would place some of Accursius's studies in the years after 1213. Tradition places Accursius's promotion and the beginning of his teaching career c. 1215, and more specifically before 1221, when he was identified as *doctor legum* and a colleague of Azo and Hugolinus in a legal consultation. The dating of this collaboration has recently, however, been questioned, for it could have occurred as late as 1230. Considering Accursius's contemporary eminence among law professors, the number of his distinguished students was small: his own son Francesco; the canonists Vincentius Hispanus and—perhaps—Sinnibaldo Fieschi (later Pope Innocent IV); and probably his younger contemporary Odofredus, also a Romanist. During a teaching career that spanned forty years, Accursius also found time to be a practicing advocate who gave his clients expert legal opinions. There is some dispute regarding whether or when he became a citizen of Bologna; one later historian identifies him in 1252 as an associate of the *podestà* (podesta), a post held only by noncitizens. But Accursius's attested membership in 1248 in the *Societas Tuscorum*, a club comprising Bolognese citizens born in Tuscany, more plausibly indicates his

possession of this status at least as of that date. His descendants certainly had Bolognese citizenship. Reports of Accursius's hostile rivalry with contemporary colleagues (e.g., Hugolinus and Odofredus) are fictions created later.

Accursius married twice; his first wife bore his eldest son Francesco (1225-1293), his second his remaining sons Cervotto (c. 1240-1287 at latest), Guglielmo (1246-1314 at latest), and Corsino (b. 1254). The disparaging rumors regarding Corsino's paternity were probably due only to the fact that Accursius was about seventy years old at the time. All the sons but Corsino became doctors of law, and two of them (Francesco and Guglielmo) also taught at Bologna. Accursius himself once expressed the opinion that sons of university doctors should receive preference in the filling of vacant chairs, a view that was sometimes put into effect at Bologna after the mid-thirteenth century.

During his career Accursius became quite prosperous. Part of his wealth certainly derived from his professorial stipend and the income from his legal practice. His town house in Bologna was eventually acquired by the city government and later integrated into the Palazzo Comunale. His country villa, "La Riccardina," was near Budrio; it was the center of an estate so large (271 hectares, or 670 acres) as to permit his sons and grandsons to receive portions of it upon his death. It later became a Franciscan convent. In later times, Accursius's great wealth earned him a bad reputation as a usurer and receiver of bribes from aspiring academic examinees, a charge also made against his son Francesco. Some modern observers remain unconvinced of these charges, citing a lack of trustworthy evidence especially as regards Accursius himself.

Accursius retired from his university post after four decades, that is, c. 1255 or thereafter. One tradition, noting that a ruined house at Bagnolo was subsequently known as the *studium Accursii*, holds that he returned to the vicinity of his native city. Other historians more plausibly suggest that he retired to his property at Riccardina. Although portions of his masterpiece, the *Ordinary Gloss* (*Glossa ordinaria*) on the *Corpus iuris civilis*, had already been published decades before, it is almost certain that he continued to revise this work throughout his lifetime. As for his other pursuits during these years, one historian (Kantorowicz 1929) has suggested that Accursius now embarked on

another monumental, albeit never completed, project: the preparation of a great encyclopedia of both laws, a *speculum iuris* predating that ultimately written by Guillelmus (William) Durandus. This suggestion rests, however, on an unconvincing reconstruction of the contents of Accursius's library, and at this point must remain an interesting conjecture.

Tomb of Accursius, Bologna. Photograph courtesy of John W. Barker.

Accursius's final years gave rise to another story—that in early 1263

he served in Florence as a resident "judge and assessor" subordinate to the podesta, dying there later that same year during his term in office. This account is inherently implausible, for why would an already rich and very famous man accept such a modest and modestly paid job? A simple confusion of names lies at the bottom of the problem—the Florentine judge and assessor was another jurisconsult, Accursius Reginus (of Reggio Emilia). The date 1263 does, however, provide a *terminus ad quern* for Accursius's death, for in May of that year a document referred to his son Francesco as *condam Domini Accursi*. In documents, Accursius was last listed as alive in 1259; a Bolognese chronicle placed his death in 1260, but a document of 1262 listed Cervotto's name in a manner suggesting that his father was still alive. The early fourteenth-century historian Villani wrote that Accursius lived to be seventy-eight. Taken together with reports regarding his birth date, the time frame 1259-1263 for his death is the best available. It is presumed that Accursius died in or near Bologna; he was first interred near San Domenico, but his remains were later moved—at his son Francesco's request—to a monumental sepulcher at the apse of San Francesco, where this son was also ultimately interred. The gravestone there is probably from the original grave with the later addition (1293) of Francesco's name: *Sepulchrum Accursii Glossatoris legum [et] Francisci eius filii*.

Descriptions of Accursius's personal appearance and habits note his tall powerful build, pensive and serious facial expression, affability, modest lifestyle, fine manners, and taste for good but not ostentatious dress. He was a heartfelt Ghibelline, but his posthumous fame was such as to release his entire family, eventually, from the penalties enacted in 1274 by Bologna's triumphant Guelf government for adherents of that defeated party. The amnesty statute of 1306 identified him and Francesco as men "who have conferred such great honor of the city of Bologna, fathers and teachers of all scholars and students of civil law throughout the entire world" (*patrum et dominorum omnium scolarium et studentium in iure civili per universum mundum, qui tantum honorem fecerunt civitati Bononie*).

Accursius's fame as a scholar rests squarely on his *Ordinary Gloss* on the constituent parts of Justinian's *Corpus iuris emitts*. His other works are of far less consequence. The *Summa authen-tici* and *Summa*

feudorum attributed to him by some scholars are considered by others to be the work of, respectively, Johannes Bassianus and Hugolinus. Also, the *Tractatus de arbitris* attributed to him is a work of his teacher Azo. Accursius edited several extravagant texts to the *Librifeudorum*, and (at least) eight expert legal opinions (*cortsilia*) of which he was the author or a coauthor are extant from the period 1230-1258. A letter written to Piero della Vigna is of doubtful authenticity, and various *quaestiones* are reported secondhand.

Adelaide

Adelaide (931-998) was the daughter of Rudolf II of Burgundy. Her intelligence and beauty—in addition to a tenuous Carolingian connection through descent from Welf (Wulf, Wolf)» the brother of Judith, wife of Louis the Pious—made her a desirable marriage prospect. When Rudolf died in 937, Hugh of Provence, who dominated northern Italy and had earlier clashed with Rudolf, obliged Adelaide to marry Lothar, Hugh's son. By 945, Hugh's power declined and Berengar of Ivrea, another warlord, forced him from Italy. Berengar tried to marry Adelaide to his son, Adalbert, when Lothar died in 950. Otto of Saxony rescued and married her (951). This match was successful, and Adelaide

was crowned empress with Otto in 962. She accompanied her husband during his six years in Italy (966–972). She was regent for her son, Otto II, and despite some friction when he became emperor, was his viceroy in Italy. When Otto III's mother, Theophano, died, Adelaide assumed the regency for her grandson. She spent her last years in Germany.

Adimari Family

The Adimari were one of the noblest and most powerful of Tuscany's great medieval families. Originally Franks who took over Lombard land around Florence, the family stemmed directly from Count Adimaro (mid-tenth century), son of Marquis Bonifazio and brother of Tedaldo, founder of the Alberti clan. From their castle of Gangalandi and other strongholds, they controlled traffic on the Arno River, and Florence battled them to submission. By 1178, Bernardo Adimari was serving as communal consul in Florence. The Adimari had become leading urban nobles as well, with a group of towers and houses centered on Via Calzaiuoli, near the Baptistry; one tower, Guardamorto, reached a height of 70 meters (230 feet). They were active in commerce and banking, with offices in Genoa by the 1260s and in Treviso somewhat later.

By the thirteenth century, the Adimari were powerful politically, as Ghibelline-hating Guelfs, and members of the family served as podestàs (a *podestà* is a mayor or peacekeeper) in Tuscan towns such as Arezzo,

Pistoia, and San Gimignano, as well as captains of the *parte Guelfa* (Guelf party) in Florence. Their continual feuding brought about their denunciation as magnates under the Ordinances of Justice in 1293.

Branches of the family included the Aldobrandini, Argenti, and Cavicciuli, who, in the later thirteenth century, were usually among the White Guelfs. A rare Black Cavicciuli took over the property of the exiled Florentine poet Dante Alighieri and opposed his return. Dante placed Tegghiaio Aldobrandi among the sodomites (*Inferno*, 6.79-81, 16.40-42) and, likewise, placed Filippo Argenti, of the "arrogant race," *oltracotata schiatta* (*Paradiso*, 17.115), in hell (8.32-63).

Despite their decline in political power, the family remained large and rather wealthy (with thirty-three taxable households in 1378) through the fourteenth century.

Aëtius, Flavius

Flavius Aëtius (d. 454), sometimes called the "last of the Romans," was born at the end of the fourth century in the Roman province of Lower Moesia on the Danube River. He was the son of the master of soldiers Gaudentius and an Italian noblewoman. He pursued a military career, and in his youth he served as a hostage first to the Visigoths and then to the Huns. Under the western usurper Johannes (423-425) he held the office of overseer of the palace. He was sent to recruit a large army of Huns, but he did not return to Italy with them until after the fall of

Johannes, at which time he was able to make his peace with the new emperor, Valentinian III. Aetius then served as master of soldiers, primarily in Gaul, during which time he became involved in a quarrel with another western general, Count Boniface. In 432, Aetius was defeated at Rimini by his rival, who himself was mortally wounded. Aëtius then took refuge with the Huns, and with their aid he soon was restored to power. In 433, he became supreme master of soldiers; the title "patrician" was added in 435.

Aëtius spent most of his remaining years campaigning in Gaul. In spite of the virtual disappearance of the Roman army, he was generally successful in keeping the barbarians out of Italy by masterfully playing one barbarian group off against another. In 451, he used a coalition of Romans, Visigoths, and Franks to defeat the invasion of Attila and the Huns. In 452, however, he inexplicably failed to defend the Alpine passes against Attila's return, and only after the Huns had captured Milan and destroyed Aquileia were they compelled to withdraw.

Aëtius exemplifies the powerful generalissimos who, in the fifth century, truly controlled the western empire. During most of the second quarter of that century, Aëtius was the most powerful Roman of the west, the real "power behind the throne." He held the consulate no fewer than three times, in 432, 437, and 446. Around 440, the senate in Rome honored him with a statue; its inscription is still extant. He was married twice, first to a daughter of the count of the domestics, Carpilio (her name has not survived), and second to Pelagia, the widow of Boniface. In the early 450s, his status was enhanced by the betrothal of his son Gaudentius to Valentinian's daughter, Placidia.

Eventually, however, Aëtius's preeminent position was his own undoing. In 454 Aetius was murdered in the imperial palace by the emperor Valentinian himself: a Roman aristocrat later told the emperor that he "had cut off his left hand with his right."

It may be that Aëtius's efforts delayed, for a time, the eventual fall of the western Roman empire. After his death, the western empire rapidly disintegrated and soon shriveled to an Italian core, which itself fell under barbarian control in 476.

Agilulf

Agilulf (d. 616) was king of the Lombards from 590 until his death, following Authari. He had been duke of Turin before his accession and legitimized his position by marrying his predecessor's widow, Theodolinda.

During his reign, Agilulf solidified the Lombard conquest of large portions of northern Italy by making peace with the Franks and establishing a fairly stable boundary with the exarchate of Ravenna. The relative independence of the more southern duchies of Spoleto and Benevento was also confirmed. Thus the Lombard kingdom was established essentially as it was to remain until the eighth century.

Agilulf's court was increasingly influenced by Roman and Catholic forms, and a Roman historian, Secundus of Non (from the Trentino),

resided there. He welcomed the Irish Columbanus and granted him land at Bobbio, where a monastery was established.

Agilulf was succeeded by his son Adaloald, whose reign inaugurated a period of dynastic strife that had both national and religious overtones.

Agriculture

In medieval Italy, as elsewhere in Europe, farming practices were constrained by basic ecological facts that people found extremely hard to overcome. The uncultivated world of forest, marsh, and heath, although often feared as "wild," had to be exploited for all the food and building materials it could provide because the success of agriculture was very uncertain. Medieval farmers, like farmers in all premodern societies, found it difficult to cope with the almost randomly occurring "good years" and "bad years" for crops. Cultivation methods were often too rudimentary to produce much in the way of a surplus, and if any surplus could be accumulated, storage techniques were often inadequate to prevent rotting and insect damage. Climate was the most unpredictable natural element. Abnormally low winter and summer temperatures (as in the cold period between a.d. 600 and 800) could

have disastrous effects on even the most carefully tended crops, but comparatively warm times (as between 1000 and 1250) helped farmers to increase yields. Obvious regional differences in climate— as between Lombardy and Apulia—determined what crops could be attempted in the first place; but it is likely that microclimatic peculiarities, which are now becoming better understood as a result of archaeological investigations involving analyses of pollen and other plant remains, helped to define the agricultural character of a given area at a much more local level. Exploiting difficult terrain was also problematic, since it was hard to drain and dig large forested, marshy, or steep areas with hoes, spades, and very simple plows. The labor required was phenomenal; this explains why the vast majority of medieval people had to be agriculturists. Consequently, agricultural life was harsh and remained so between the millennium 400 and 1400, despite the changes in farming practices, technology, and economic organization that were taking place in Italy. (Real improvements in conditions had hardly taken place before the twentieth century.)

Still, agriculture was in many ways more richly diverse in medieval Italy than it had been in Roman times. This can be seen from the very wide variety of crops, many of which had not been cultivated in Italy in the Roman period. Most descriptions of medieval Italian agriculture stress, rightly, that its basis was cereals, vines, and olives, the classics of Mediterranean farming and diet. Cereals were widely grown, the choice of grain depending on the soil quality, terrain, rainfall, and so on. Predominantly, the farmers of the early Middle Ages grew the so called poorer cereals (barley, rye, oats, millet, and sorghum); but olives were also common—in fact, they were present almost everywhere.

Cereals, vines, and olives may have been the most characteristic crops, but many other plants, edible and nonedible, were raised. Of staples, the chestnut was particularly important in hilly regions, especially in the Appennines; it was not a "wild" plant but was carefully cultivated and highly valued. Vegetables and fruits are not mentioned so commonly in the historical sources, but that may be because their presence was taken for granted. Certainly orchards were prized, and they were common near the northern lakes, in Romagna and the Marches. New citrus fruits—lemons, bitter and sweet oranges—were introduced into southern Italy from the east in the later medieval

period. Other new exotics, like sugarcane, also appeared at that time. Important plants grown for textiles and dyes included flax, hemp, madder, and woad in the north, and cotton and saffron in the south.

Stock raising has received rather less attention from historians than plant cultivation, but there can be little doubt that it had a crucial place in the medieval Italian economy. Animals provided fertilizer and energy for farming, both of which were in short supply from other sources. The commonest animals raised were pigs, sheep, goats, and cattle, supplemented by horses, asses, and poultry. Fish, too, were sometimes farmed. As with plants, techniques of animal husbandry varied across Italy. How animals were raised also seems to have depended on what products they were required for. According to the archaeologist Gillian Clark, evidence from many central Italian excavations indicates that dead animals were mainly used for meat and leather (primary use); that living animals were exploited for wool, hair, eggs, and milk (secondary use); and that stock-raising techniques varied accordingly (younger animals were intended for meat, older animals for wool and other products). Many farms seem to have kept a motley mixture of animals, but in the later Middle Ages specialized production of beef cattle began to become important in some areas, notably Farfa Abbey and the Arno valley in Tuscany, Apulia, and the lower Po plain. Animals were useful because their pastures were land that was often unsuitable for other purposes, but they could also be extremely labor-intensive when transhumance was involved—that is, when animals were taken on the great annual summer movements from plains to hills and back again. Transhumance was common in the Appennines, although not in the Alps. Apart from this movement, most Italian agriculture was suited to a sedentary settled existence and was organized accordingly.

There were many variations in the organization of agricultural production across Italy. It is likely that most agriculturalists lived on small holdings, in family units, often within the framework of a nucleated village settlement to form, in Pierre Toubert's phrase, a "complete peasant exploitation." These peasant farmers produced food for themselves and their families, and sometimes a surplus that was either sold or given as rent to a powerful local lord. The relationship between peasants and lords took differing forms. Often, it is hard for

historians to characterize such a relationship with any precision, because contracts between cultivators and noncultivators were usually not written down in the period before about 1200. Therefore, it is extremely hard to know to what extent the secular or monastic owners of large estates actually determined what was produced there, or if the peasants were given a free hand so long as they produced a surplus with which to pay the owner. Italy, like many other regions in medieval Europe, can be said to have had a "manorial system" (a rough translation of the Italian *sistema curtense*), particularly between about 800 and 1000. Nowadays, historians emphasize that such estates were organized locally in many different ways and were not self-sufficient as commonly as had previously been thought. This was because the agricultural economy—with the possible exception of some (not all) particularly isolated mountain farms—was never static and was never removed from the wider ecological and economic systems of Italian society.

Toubert proposed a helpful typology of earlier medieval Italian estate structures that has become the standard framework for analyzing the organization of agricultural practice. Toubert suggests a threefold division of widely recognizable types:

1. "Pioneer" estates. These were pastoral and very often had no central demesne area (the part of the estate directly supervised by the owner's agent and farmed by slaves or semiservile workers and local peasants who worked there part-time as part of their "render" requirements).
2. More structured units, specializing in olive oil and wine, sometimes as cash crops for sale in local markets.
3. Classic estates, based on cereal cultivation, on rich soils with highly developed demesne centers.

Examples of each type have been found by historians all over Italy during most periods. Toubert's discussion is valuable because it provides a reminder that a degree of specialization in production was evident in Italian practice from the early Middle Ages on. This seems to have been particularly true in two contexts: monastic estates, where abbots often demanded cash-crop production of oil and wine and

caused some land to be opened up to agriculture for the first time; and farms near towns, where, increasingly in the later period, specialized market garden crops were grown for urban sale.

It is not always easy to imagine, from the surviving texts, what these estates actually looked like on the ground. However, certain general points can be made. The cultivated landscape in most places was a combination of open (*terra aperta*) and enclosed fields (*clausurae*), in close proximity to uncultivated land. The proportions at any given time and place are almost impossible to work out. However, one can generalize by saying that in the earlier period there were more open fields, which were sometimes communally owned and worked by the village, whereas from the twelfth century on more enclosed fields appeared, especially around Milan, as more owners fenced off plots from communal use. This development spread to the rest of Lombardy, Liguria, and Tuscany in the thirteenth century and a little later to Lazio and Campania. Most of these changes seem to have taken place very slowly, with a consequent gradual change in the appearance of the landscape. Occasionally, more obvious changes took place more rapidly. There was probably more land under cultivation in Italy during the medieval period than at any earlier time, and this was largely a result of a new combination of efforts by the peasants and pressure from the monasteries. Vito Fumagalli has found that the monasteries of Nonantola and Bobbio caused new areas of the lower Po plain to be opened up for agriculture by deforestation and drainage as early as the first half of the ninth century. Their abbots pursued this as a deliberate policy by issuing special *libellus* contracts to peasants requiring them to undertake clearance as part of their contractual relationship with the community. Terms such as *novellae* (new plots) and *noviculta* (newly cultivated) also appear in charters from elsewhere in the Po valley.

The farmers had little in the way of new technology to aid them in transforming the landscape. Most of their basic tools were ancient and did not change for centuries. The most important technological change was the increasingly widespread use of the water mill from about 1000 on. It made the milling of flour much more efficient, as did the later introduction of the windmill to Lombardy around 1300. New irrigation techniques borrowed from the Arabs aided the cultivation of rice and cotton in the south.

The study of medieval Italian agriculture is now entering a new phase with the increasing use of advanced archaeological techniques to analyze site data such as pollen, grain samples, animal bones, and farming implements, allowing a more precise picture of individual agricultural sites and their production in the medieval period. These new techniques are important because only through them can we determine how much of medieval practice was inherited from Rome and how much was true innovation. Perhaps even more exciting is "landscape archaeology." Landscape archaeology uses the field survey—pioneered in central Italy by teams from the British School at Rome—to analyze large areas and observe changes in land use and settlement patterns over a longer span of time than is possible with conventional historical methods. Notable among these surveys are those of south Etruria, the Biferno valley, and Farfa, which have given us more precise data than ever before about what was grown where.

Aistulf

Aistulf (d. 756) became king of the Lombards in 749 by overthrowing his brother Ratchis, presumably because Ratchis was not following an expansionist policy aggressively enough. Under Aistulf, the Lombards

in 751 occupied Ravenna and moved toward Rome. Pope Stephen II appealed for aid to the Franks, who were indebted to the papacy because it had legitimated the new Carolingian dynasty. In 755, the Franks under Pepin I invaded, defeated Aistulf, and obtained an agreement that the Lombards would cede to the papacy all of the exarchate they had occupied. When Aistulf failed to carry out these terms, Pepin invaded again, in 756, and forced compliance. When Aistulf died there was a brief interregnum; he was then succeeded by Desiderius.

Alaric the Visigoth

Alaric (c. 370-410) was one of the Visigoths who were allowed to cross the Danube River into the Roman empire by the emperor Valens in 376. The Visigoths were the first group of barbarians to be allowed into the empire en masse, and their arrival marked the beginning of the "barbarian invasions." In reality, the Visigoths were more a motley conglomeration of ruffians than a discrete ethnic entity. They were augmented by accretions of renegades, deserters, slaves, dispossessed

peasants, and other barbarian tribes.

Alaric himself first appears in history in the early 390s as a Visigothic military leader. In 394, he served in Theodosius's campaign against the usurper Eugenius, but then, unhappy about not receiving a sufficient reward, he revolted. Between 395 and 397, he and his Goths devastated Thrace and Greece, sacking several famous cities and on several occasions escaping destruction by the western general Stilicho. In 398 or 399, Alaric was granted the office "master of soldiers of Illyricum." In spite of this honor he invaded Italy in 401 and besieged the emperor Honorius in Milan. In 402, he was defeated at Pollentia and again at Verona by Stilicho, who then allowed him to withdraw from Italy. In 407, Alaric was engaged by Stilicho in a plan to seize Illyricum for the west, but this scheme was frustrated by the revolt of Constantine III in Britain and Gaul (407-411).

After Stilicho was murdered in 408, many of his partisans joined Alaric, who had since moved into the province of Noricum on the northern Italian border. Then, when Honorius refused to pay Alaric for past services, the Visigoths invaded Italy once again in 408 and besieged Rome, having been promised assistance from a group of Visigoths and Huns led by Alaric's relative Athaulf. A long series of negotiations then ensued among Alaric, the senate at Rome, and Honorius, who by then was safely ensconced in Ravenna. The siege of Rome was alternately lifted and renewed several times as Honorius continued to delay, the main sticking point being Honorius's refusal to make Alaric master of soldiers. In 409, Alaric even allowed the senate to name a new emperor, Priscus Attalus, who then granted Alaric his desired rank. Finally, in 410, after being joined by Athaulf and attacked by imperial forces, Alaric returned to Rome, which he captured and sacked beginning on 24 August. As sacks go, this one was rather genteel. It lasted only three days, and the churches, at least, were generally left untouched. The damage was more psychological than material. For the first time in 800 years Rome had fallen. No longer could the city be called *Roma invicta* ("unconquered Rome").

After leaving Rome, Alaric and his men traveled south, hoping to cross to Sicily. Foiled in this endeavor when the Gothic fleet was wrecked, Alaric turned back north, and on this journey he became ill and died in Bruttium. He was said to have been buried in the bed of the

Busento River after the stream had been diverted. His position then was taken by Athaulf, who, two years later, led the Goths into Gaul.

Alberic of Monte Cassino

Alberic (fl. 1065–1100) was a monk, deacon, and teacher or grammar and rhetoric at the abbey of Monte Cassino under its great abbot Desiderius. Alberic's life offers few fixed dates. He was probably born in southern Italy and was at Monte Cassino (to which he may have come as an adult) by 1065. In 1078–1079, he successfully defended orthodox eucharistic doctrine against Berengar of Tours at a Roman synod; perhaps during the 1080s he composed a lost work, *Contra Heinricum imperatorem de electione romani pontificis*. He died before 1105 (when his name appears in two datable Cassinese necrologies) and was buried in Rome.

The chief primary sources for Alberic's life are the *Chronicon Casinensis* (3.35) and *De viris illustribus* (21), both by Peter the Deacon, a twelfth-century archivist and historian of Monte Cassino. Of Alberic's prose writings listed by Peter, those on music, astronomy, and dialectic are lost, as are *De virginitate sancte Marie* and his "very many" letters to Peter Damian. His rebuttal of Berengar, *De corpore domini*, has recently been identified. Five saints' lives are attributable to

Alberic, and a homily and verses on Saint Scholastica (with her brother, Saint Benedict, buried at Monte Cassino); other hymns and *rithmi* named by Peter the Deacon are not by Alberic. Alberic helped Desiderius compile four books of *Dialogi* recounting miracles among the monks of Monte Cassino (*Chronicon Casinensis*, 3.63).

Alberic is best-known, however, for his writings on rhetoric and style, all of which reflect the needs of classroom teaching and an active writing community. The *Liber dictaminum et salutationum* named by Peter may refer either to one part of the *Breviarium de dictamine* (preserved in five manuscripts, only one complete), which in its present form combines grammatical and rhetorical material from various sources, or—though this is less likely—to the *Flores rhetorici* (also called *Dictaminum radii*, known from four manuscripts). The *Liber de barbarismo et soloecismo tropo et schemate* draws on numerous texts, including Cassiodorus's massive *Expositio psalmorum* and some distinctively Cassinese sources, to define and illustrate (chiefly from the Bible) a remarkable total of nearly 130 rhetorical figures. Finally, a work on syllable length bespeaks an interest in prosody, and Alberic may also have been responsible for a *Lexicon prosodaicum*, a systematic, alphabetized guide to metrical quantities in classical Latin poetry.

Debate about Alberic's importance in the history of medieval rhetoric, especially the beginnings of the *an dictaminis*, has been handicapped, though seldom inhibited, by the fragmentary publication of his works. *Dictamen* means artistic composition in general, and both the *Flores* and the *Breviarium* concentrate on techniques of rhetorical ornament in prose. The term refers especially to letter-writing, however—an important literary genre throughout the Middle Ages—and these two works, as the first to contain instruction accompanied by sample salutations and model letters, presage the twelfth-century *ars dictaminis* with its many handbooks devoted to epistolary theory and model letters.

Alberic himself was a precocious student: in a recently discovered letter accompanying his *Passio sancti Cesarii* that exudes self-confidence and stylistic polish, Alberic declares that he is thirteen years old and has been engaged in *liberalibus studiis* for six years. Like most of his other hagiographical compositions, this one reworks an existing text (and as such represents a typical school exercise); it uses the *cursus*

(techniques of rhythmic prose) and displays his characteristic exuberant delight in manipulating language.

Albertanus of Brescia

Albertanus (c. 1190-1251 or after), an author of legal treatises and addresses, was active in the political and professional life of the commune of Brescia in the first half of the thirteenth century. We know quite a lot about him from his appearances in official records (e.g., as a witness to a treaty or to a legal document) and from what he reveals in his own writings. A *causidicus*, or legal intermediary, perhaps with judicial powers (the precise function of this role is now unclear), he was regarded highly enough to be called on to serve his commune politically. On at least one occasion he was an aide to his fellow-Brescian Emmanuel de Madiis when the latter went to Genoa as *podestà*. In 1238, he was entrusted with the captaincy of the fortress of Gavardo, to defend it against the forces of Emperor Frederick II in the struggle of the Lombard League against the imperial campaign in northern Italy. He lost, but only after a vigorous defense against an especially vicious siege.

Albertanus was the author of three Latin didactic treatises and five "sermons"—spoken addresses delivered before his fellow *causidici* at meetings of their lay confraternity. These works became widely—in fact, explosively—available immediately after their creation and are to be found all across Europe; Albertanus's works were read and copied until the eve of Reformation. His first (and longest) work is *De amore et*

dilectione Dei et proximi et aliarum rerum et de forma vitae, completed while he was imprisoned at Cremona in 1238. Here he first set out his notion that social transformation is to be achieved through voluntary personal commitment to a "rule," an idea which would permeate all his subsequent writing. A sermon he delivered in Genoa in 1243 provides a prototype for his *De doctrina dicendi et tacendi* of 1245. Structured according to the rhetorical "circumstances" of classical tradition, this treatise examines the use of spoken discourse, especially among the legal profession, as a means of social empowerment. A third treatise, *Liber consolationis et consilii* (1246), denounces the threat to order afforded by the urban vendetta—the northern cities of Italy were frequently riven by lobbyists, and street fights between politically partisan groups were far from unknown. In this work, he sees social change as to be achieved through personal moral development. His final works comprise four more sermons, delivered to his legal confraternity in Brescia in or about 1250. In these short sermons, Albertanus develops and reiterates themes of his major works, and they may be seen as reflecting the maturity of his thought. The last sermon, with its topic of fear of the Lord (and perhaps also its lack of clear structure), suggests that these sermons were his swan song. There is no reason to believe that he wrote anything after them, and further attributions of authorship are undoubtedly false.

Albertano drew on familiar sources for his works, among them Seneca, Cicero, Justinian, Cato, Godfrey of Winchester, and the Bible. But he appears also to be the first writer to make use of the work of the Spanish convert from Judaism, Peter Alfonsi, and may well be the first scholar to have assembled all twelve books of Cassiodorus's *Variae*. In this sense we can regard Albertanus as a precursor of the Renaissance book collector. The focus and synthesis of his writing, however, make it wrong to dismiss him as a mere compiler. His remedies for the social problems he met with professionally mark him as an early and insightful social theorist. His views on the consensual adoption of a secular rule (*propositum*) as a way of life and its potential as an engine of social change make him unique for the period. That he wrote as a layman is also remarkable. His beliefs about the role of the legal profession as a body with responsibility for social stability and development reveal an early understanding of the significance of the

rise of an urban professional class. His sermons are among the earliest evidence we have of lay preaching and oratory.

More than 320 surviving Latin manuscripts, across Europe, indicate that Albertanus was one of the most widely read authors in the latter medieval period. *De doctrina* in particular is well represented in manuscript, and it also went through at least thirty-five printed editions by 1500. Among the subsequent writers who knew and utilized these works are Brunetto Latini, Chaucer, John Gower, the author of the *Fiore*

di virtù, Christine de Pizan, and (arguably) Dante. Except for his sermons, Albertanus's work was translated into every major western European language, though sometimes at quite a distance from the original context. More than 130 manuscripts and numerous early printed editions are known of vernacular versions of his treatises; these include English, German, Italian, French, Catalan, Castilian, Czech, and Dutch versions. More research on his influence is needed.

Powell (1992) supplies a recent and authoritative discussion of Albertanus and his works and provides a starting point for contemporary scholars working in English. Some discussion, especially of vernacular versions, is added by Angus Graham (1996), who extends Powell's bibliography. Both supply further reading. Further literature in English is concerned largely with Chaucer's use of Albertanus. Details of Latin manuscripts are given by Navone (1994, 1998), though she lists only 243, and supplemented by Graham (2000a,b). The currently published Latin editions do not reflect the best critical edition, but adequate ones are provided by Sundby (1884, *De doctrina*, app., 475-509), Romino (1980), Fe d'Ostiani (1874), Ferrari (1955), and more recently by Navone. Ahlquist offers a welcome fresh edition of the four Brescian sermons (with English translation); and Marx has translated, from Sundby, a portion of the *Liber consolationis* (in Blamires et al. 1992, 237-242). All but two of the published vernacular versions are cited by Graham (1996), and there are further discussions and vernacular manuscript listings in Graham (2000a,b).

Albertino (1261-1329), the greatest Latin poet of his age, was born in Padua of lowly parentage. Orphaned at a young age, he had the responsibility of caring for three younger siblings—two brothers and a sister. (One of the brothers would eventually become the abbot of Santa Giustina, the great Benedictine monastery of Padua.) Early in his life, Albertino earned money by copying books for students at the university; later he became a notary and the son-in-law of the powerful Guglielmo Lemici, a very successful Paduan usurer. With the backing of the Lemici clan and his own natural abilities, he played a prominent role in Paduan public life, at home and abroad, in peace and war, from around 1310 to his final exile in 1325, when the Carrara family finally broke the influence of the Lemici. He died in exile in Chioggia four years later.

But it was not Albertino's successes as orator, statesman, warrior, or diplomat of Padua that make his name illustrious today. It is, rather, his remarkable achievements as a man of letters in the context of a late medieval Italian commune. Even before his emergence as a figure in Paduan political life, Albertino had become a member of a small group of scholars gathered around Lovato de' Lovati, an older Paduan judge. These men studied the Latin poets as an avocation. The existence of Carolingian manuscripts at the Capitular Library in Verona, and in the Benedictine abbey of Pomposa near Ravenna, made possible this learned diversion of the *cenacolo padovano* ("Paduan circle"). The members of the *cenacolo* were already familiar with the traditional set of Latin poets, established earlier in the thirteenth century—Virgil, Horace, Ovid, Lucan, and Statius—and Lovato was the first to take the next logical step, composing original Latin poetry himself. Indeed, Petrarch recalled his achievement.

Albertino, following in Lovato's wake, composed poems that helped to rehabilitate some forms of Latin poetry. One example is his defense of such poetry against the strictures of a Dominican, Fra Giovannino. Another is his birthday elegy, in which he reviews his life and the highlights of his career, including his laureation. This may have been the first work since antiquity in which an author focused on his own day of birth for reflection and celebration.

In the 1320s, Albertino went to Siena in his capacity as a diplomat and on the way, near Florence, fell ill. The literary result of this illness

was his poem *Somnium* ("A Dream"), recounting his concept of the afterworld, with particular attention to the nether regions. (Dante's *Inferno* was already in circulation at this time.)

Albertino also left us a bountiful harvest of Latin prose works, especially contemporary histories of Italy—*De gestis Henrici VII Cesaris* (*The Deeds of the Emperor Henry VII*) and *De gestis italicorum post Henricum VII Cesarem* (*Italian Events after the Death of Emperor Henry VII*). However, for all his learning and experience, his histories were no match for his poetry, or for the historical text that was at the root of Padua's self-understanding: Rolando's *Chronicles of the Trevisan March*.

Albertino also studied the tragedies of Seneca with Lovato and composed introductions to the plays, as well as an explanation of tragic meters for the younger Marsilius of Padua, the author of *Defensor pads*. In 1315, in imitation of Seneca and in connection with local history, Albertino wrote his finest and most lasting work, *Ecerinis* (*The Tragedy of Ecerinus*), about the tyrant Ezzelino III da Romano (1194-1259), the ruler of Verona. Like some of his contemporaries, Albertino saw an analogy between Ezzelino and the current lord of Verona, Cangrande della Scala. Albertino was familiar with the details of Ezzelino's career from Rolando's *Chronicles*, which stressed the heroic, united, Catholic character of Paduan resistance. This was the story Albertino found ready to hand as he attempted to awaken his fellow citizens to the danger of renewed aggression by the Veronese. He was inspired to cast this tale in the form of a Senecan tragedy, *Thyestes*, and thus wrote the first tragedy since antiquity. It was for *Ecerinis* that Albertino was crowned with laurels, just as Rolando had been crowned for the *Chronicles*. However, Albertino failed in his goal of awakening Padua, and Cangrande conquered the city in 1328. Because of his staunch political opposition to Cangrande, Albertino went into exile; he died at Chioggia on 31 May 1329.

Albertus Magnus

Albertus Magnus or Albert the Great of Ratisbon (c. 1193 or 1206-1280) has emerged as one of the great encyclopedist theologians of the late Middle Ages. He entered the Dominican order at Padua in 1223; moved north to teach at the schools of Hildesheim, Cologne, and Ratisbon and then moved to Paris; but in 1248 returned to Cologne, where he organized the Studium General. In 1260, he was appointed bishop of Ratisbon; however, he resigned so that he could concentrate on his literary efforts. His most distinguished pupil was Thomas Aquinas, whose doctrines he later defended at Paris in 1277.

As a cleric, Albertus was interested in documenting the world around him according to the sanctity of tradition, but he departed from most of his predecessors and contemporaries by actually trying to test some of the legends he recorded in his vast works. His approach to the science of his time represented a major shift from the earlier tradition, which had been based entirely on authority. For example, he tested the story that ostriches like to eat iron by attempting to feed them some nails. To his surprise, the ostriches refused the iron, though they would, he testifies, eat small stones.

The works of Albertus are considered somewhat disorganized and are full of digressions, but they are very comprehensive: in scope, Albertus is exceeded only by Aquinas. Albertus's largest work (although incomplete) is the *Summa theologiae*. His other works include *Commentary on the Sentences of Peter Lombard* and *Summa de creaturis*.

In general, Albertus often avoided the fantastic, preferring direct observation and straightforward commentary on nature; for example, he describes how an herb or a fruit might affect the body, mind, or

spirit rather than relating traditional allegories about it. His *Book of Secrets of the Virtues of Herbs, Stones, and Certain Beasts*, as its title suggests, has more to do with the benefits of herbs and stones and their therapeutic or culinary uses than with their symbolic value for moralizers. His comments are linked to the four humors, which medieval medicine inherited from Hippocrates, the chief physician of the ancient world. In his book *On Falcons, Dogs, and Horses*, Albertus is clearly interested in the hunt.

As a whole, Albertus's methodology, as expounded in *Metaphysicorum*, is based on a breakdown of knowledge into the medieval "trivium" and "quadrivium," numbers in themselves replete with symbolism. The trivium comprised the superior areas of learning (i.e., the three divine philosophical and theological subjects); the quadrivium pertained to more practical knowledge, such as music and geometry. Learned persons—in actuality, only the priesthood and the nobility—were those trained in both classes of information.

Albertus also had significant influence on artistic taste, through his commentaries on the feminine figure of Mary in *De laudibus beatae Mariae Virginis* (*In Praise of the Blessed Virgin Mary*) and *Mariale, sive questiones super evangelium: De eorporali puchritudine Mariae* (*Questions Concerning the Gospel: On the Corporeal Beauty of Mary*).

Albertus also wrote about the sacramental altar and about what constitutes a reliquary and a sacred site.

Albizzi Family

The Albizzi represented the most conservative element within the merchant aristocracy of republican Florence. A long-established family who were first represented in the *signoria* in 1283, they attained their greatest commercial and political prominence in the second half of the fourteenth century. By 1350, the Albizzi had emerged as the leaders of a political faction which sought to dominate the *parte Guelfa* (Guelf party) and the Florentine government by restricting the major offices of both to members of the older families. Opposed to the Albizzi was a faction led by the Ricci that favored the inclusion in politics of new men, those recently risen to wealth and membership in the major guilds.

The rivalry between the Albizzi and the Ricci was regarded by the Florentines as such a threat to the republic that in 1366 both families were banned from holding office for ten years. In 1378, Piero degli Albizzi, whose wealth and political alliances had made him the dominant political figure, was dealt a severe blow by the reform-minded *balia* created in the wake of the *ciompi* (working-class) uprising. Piero and his male descendants were declared magnates subject to the political liabilities imposed on the nobility by the Ordinances of Justice, and he was exiled from Florence.

The Albizzi again became the leaders of an oligarchical faction in Florence in the 1380s, and once again their ambition threatened the stability of the republic as they and their new opponents, the Medici, sought to gain control of the machinery of government.

Alboin

The semilegendary king Alboin (d. 572) led the Lombards over the eastern Alps into Italy in 568. He had become king some years before, succeeding his father, Audoin, who was not a member of the old Lething dynasty.

Alboin's career before the descent into Italy is known primarily from old sagas. The Lombards, in league with the Avars, made war on the Gepids (who were living in the central Danube region). The Gepids were defeated, and their king, Cunimund, was killed by Alboin, who then took Cunimund's daughter Rosamund as his captive and wife. It is said that after the invasion of Italy, Rosamund conspired to have Alboin murdered in his bed because he had forced her to drink from a cup made from her father's skull. In any event, Alboin was assassinated in 572.

The invaders that Alboin took into Italy included not only Lombards but also a number of other Germans, including a large group of Saxons. The incursion seems to have taken the Byzantines by surprise. Cividale (Friuli) fell first and became the center of a first Lombard duchy (a frontier march). A number of *fare* (kin groups) were left to organize the march; the remainder followed Alboin into the Po Valley, where Milan and Pavia (the latter only after a long siege) were occupied and became the center of the slowly emerging Lombard kingdom. Alboin was followed as king by Cleph.

Albomoz, Gil Álvarez Cabrillo De

Cardinal Gil Alvarez Cabrillo (Carillo, Carrillo) de Alborno (1302 or 1303-1367) was a soldier as well as a churchman. Alborno's campaigns restored central Italy to the papacy in the 1350s and 1360s, after decades of control by local despots. This made possible the return of the papal court from Avignon to Rome in 1377, ending the Avignonese papacy.

Born to an aristocratic Castilian family, Alborno was marked early for an ecclesiastical career. After studying canon law at Toulouse, he became chaplain and counselor to King Alfonso XI. In 1338, he succeeded his uncle as archbishop of Toledo. Over the next decade Alborno took a leading role in the wars of reconquest, gaining a considerable reputation not only as a soldier but as a diplomat.

Alborno's relations with King Alfonso's successor, Pedro I (the Cruel), were strained. Fearing disgrace, Alborno fled to the papal court at Avignon in 1350. By December of that year, he had renounced the see of Toledo and been made a cardinal. In 1352, Pope Innocent VI named him papal delegate and vicar-general to the papal states and to central and northern Italy. His mission was to regain control of these areas from the petty lords who had seized them after the popes left Italy for Avignon.

Alborno fought two long campaigns in Italy. The first, lasting from 1353 to 1357, secured the papal states, the Marches, and Romagna, including the city of Bologna. The second, fought between 1358 and 1364, attempted to free papal territories from the influence of the Visconti and the Ghibellines of the north by extending papal power into Emilia and the southern reaches of the Po valley.

In 1357, Alborno promulgated a set of laws for the lands he had

conquered that was later known as the *Constitutiones aegidianae*. This became the basic legal code of the papal states and was not superseded until the Napoleonic era. *Constitutiones* attempted to regularize earlier laws of the region while reversing legislation that Albornoz considered prejudicial to ecclesiastical liberties. It also balanced strong papal government with a certain autonomy for towns, since Albornoz was concerned to avoid alienating these important allies against the troublesome nobility. Generally, Albornoz championed communal rights and the authority of communal assemblies against the privileges of the nobles.

During his campaigns in the papal states, Romagna, and the Marches, Albornoz made rapid progress and achieved quick success. He was not as fortunate in his subsequent operations in the north. These dragged on at enormous cost, with no assurance of victory. In 1363, a new pope, Urban V, decided to replace Albornoz and seek a negotiated peace. Albornoz was kept in Italy, however, as papal legate to Naples and Bologna. In 1365, he founded the Spanish College at the University of Bologna. He died in 1367, while accompanying Urban V on the first papal visit to Rome in more than sixty years.

Albornoz's victories made certain that the papacy could return to Rome in 1377, and his administrative and legal reforms provided the basis for papal government in central Italy for centuries. His achievements might be better recognized had not many of the political gains he made for the papacy been so quickly lost during the Great Schism of 1378-1417.

Aldobrandeschi Family

From Carolingian times to the late thirteenth century, branches of the Aldobrandeschi family controlled an enormous feudal territory in western Tuscany. At first centered on Lucca, with holdings as far north as Parma, the family's power later shifted south to the Maremma. The Aldobrandeschi were probably of Lombard origin and may have been descendants of Liutprand's successor, King Ildebrandino, who reigned briefly c. 744. Family lordship was based on a combination of control over monastic lands and comital authority, from the late ninth century around Lucca. By the communal period, the main branch ruled the *contado* (district) between Siena and Orvieto as counts of Sovana, Pitigliano, Santa Fiora, etc. This *terra aldobrandesca* began to come

under the control of Orvieto with a minor submission to the commune in 1168. In 1208, Orvieto arbitrated a testamentary dispute among four Aldobrandeschi heirs and gained further submissions in the process. Communal control increased in 1216 after another arbitration and the imprisonment of two Aldobrandeschi brothers for debt.

In 1251, family rivalries caused a defection to the Siense, long rivals for control of the Aldobrandeschi lands; in 1259, a Siense army ousted the haughty Umberto from his castle of Campagnatico and killed him (*Purgatorio*, 11.58-69); and in 1274, the northern portion, Santa Fiora, formally submitted to Siena. Throughout the fourteenth century, Siena absorbed these lands, eventually nullifying the authority and power of the Aldo-brandeschi. In 1284, the southern portion was inherited by Margherita, who had married Guy di Montfort. Orvieto and Pope Boniface VIII dueled for hegemony, and in 1303 Orvieto gained the upper hand, with title descending to the Orsini family through Anastasia, the daughter of Margherita and Guy.

Alessandria

Alessandria is a commune in the Piedmont region along the Tanaro River in the Marengo plain. The first settlement (c. 1164) was named Civitas Nova or Cesaria and was founded by the Ghibelline William V "the Elder," marquis of Montferrat, who drew together the leading citizens of four smaller communes (Rovereto, Bergoglio, Marengo, and Gamondio) with the intent of expanding his own sphere of interest. However, factions opposed to Montferrat grew in the new city and drew it into an alliance with Milan. In 1167-1168, with the assistance of "new men" and refugees from small towns in the vicinity, the city was renamed Alessandria in honor of Pope Alexander III. Alessandria was attacked by the imperial forces of Frederick I (Frederick Barbarossa) and William the Elder, who besieged it for six months in 1174-1175. In 1183, as a consequence of the Peace of Constance, the city reassumed its original name, Cesaria, a name it held until nearly the end of the century. In 1198 it returned to Guelf control and was once again renamed Alessandria.

For the next 150 years, Alessandria was in a continual struggle with the neighboring cities of Casale and Genoa, while torn by internal strife between Guelf (Guaschi and Dal Pozzo) and Ghibelline (Lanzavecchia and Inviziati) family factions. It was also subject to depredations by William VII of Montferrat (1260) and by Charles of Anjou (1268). The Angevins (Robert of Anjou) and the Visconti contended for the city, and in 1348, the Visconti annexed it definitively for Milan.

The original town walls, consisting of earthworks, moat, and guard towers, were replaced at the beginning of the thirteenth century with stone fortifications and a bridge over the Tanaro River. These were reinforced and expanded in 1362 and served the city until the sixteenth century. Among the earliest ecclesiastical buildings are the churches of Saint Rocco (twelfth-fourteenth centuries), Saint Francis (thirteenth-fourteenth centuries), and Santa Maria di Castello (fourteenth-fifteenth centuries). The city's first cathedral, dedicated to Saint Peter, was demolished in 1805 by the French.

Alesso Di Guido Donati

Nothing is known of Alesso di Guido Donati's life except that he was a Florentine poet who lived during the second half of the fourteenth century. His collected poems comprise eleven madrigals and two *ballate* that are contained in the manuscript Magliabechi VII, 624 (fourteenth century), at the Biblioteca Nazionale Centrale in Florence. Unlike the *ballate*, *Di te son servidor* and *Da poi ch'Amor più volte m'ha fallito*, Donati's madrigals are steeped in lively, realistic imagery and dialogue and treat conventional themes, especially the vicissitudes of amorous pursuit, in a daring and playful manner. Antonio Lanza has noted the "clearly hedonistic and fundamentally erotic" (1978, 142) tone of Alesso's poetry.

In the madrigal *Accese montanine*, for example, Alesso creates a humorous and innovative effect by artfully combining features of *stilnovo* and *scuola siciliana* style with references to the beginning of Dante's infernal journey (*deh la via mia smarrita m'insegnate: / tan to ch' i' torni al mio dritto cammino*) in order to represent the lover's conquest (*e io con bad sollazando seco*). In another madrigal, *Ellera non s'avvitola*, Alesso represents the euphoria of two lovers as they dare to embrace before the eyes of a dozing guardian: "*Abracciamirisposile, / "e, s'ella ci ode e grida, fuor cacciamola."/ E ciò dicendo volto a volto puosile / e colsi frutto del suo orto giovine* (vv. 7-10). The incisive representation of the lovers' actions and emotions (desire, and fear of being caught *in flagrante delicto*) is enhanced by the fluid development from the descriptive analogy that introduces the poem through the dialogue that occupies the central verses and finally to the narrative that concludes the poem. After reading these and other madrigals, such as *Cavando d'un cespuglio calcatreppi, Di rietro a un volpon che sen portava, I' mi son qui selvaggia pasturella*, and *Con lieve piè, come la pecorella*, the reader will perhaps agree with Lanza, who believes that

Alesso has been underrated.

Alexander III, Pope

Pope Alexander III (Rolando Bandinelli, c. 1105-1181) was born in Siena. He received training as a theologian and canon lawyer and became a member of the faculty at the University of Bologna. He was made a cardinal by Eugenius III in 1150 and was appointed chancellor of the Roman Curia in 1153. During his academic years, he wrote a commentary on Gratian's *Decretum*; subsequently, as a cardinal, he wrote a theological treatise, *Sententiae*, directed against the influence of Abelard. Under Pope Adrian IV he was the strongest opponent of Frederick I (Frederick Barbarossa) and an advocate of the papal alliance with the Normans. In September 1159, in a divided election, he was chosen pope, but a pro-imperial minority of cardinals chose a rival pope under the name Victor IV, blocked Alexander's investiture, and drove him out of Rome. Two weeks later, in Ninfa, Alexander was consecrated pope; he then began a series of protracted international

negotiations over his status while Frederick continued to back a series of antipopes.

Pope Alexander III. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 202v.

During a period of exile in France, Alexander began to build a series of alliances against Frederick that eventually enabled him to return to Rome in 1165. He became the focal personality in the organization of the cities and regimes of Italy against the imperial schemes of Barbarossa. The climax of the anti-imperial struggle came with the victory of the Lombard League at Legnano in 1176. Through the mediation of the Venetian republic, Alexander and Frederick became reconciled in a famous meeting in Venice in 1177.

It was in part Alexander's preoccupation with Italian affairs that allowed Henry II of England to pursue his struggle with Thomas Becket

(c. 1118-1170) over the status of the English church; in 1173, Alexander canonized Becket. In 1179, Alexander presided over the Third Lateran Council, which established the principle of a two-thirds vote in papal elections. He also conducted brief, superficial negotiations with the emperor Manuel I Comnenus over the reunion of the Greek and Latin churches. In Alexander's last years, renewed popular violence forced him to leave Rome, and he died in Civita Castellana on 30 August 1181. His struggle with Barbarossa is recorded in a cycle of frescoes by Spinello Aretino in the Sala di Balia of the Palazzo Pubblico in Siena.

Alexander IV, Pope

Pope Alexander IV (Rinaldo Conti, count of Segni, 1199-1261) was a nephew of Gregory IX and a patron of the Franciscan order and was elected pope in 1254 to succeed Innocent IV. He saw the Ghibelline cause revive under the leadership of Manfred, an illegitimate son of Frederick II. Although peace-loving, Alexander supported candidates to the thrones of both Naples and the empire who would oppose Hohenstaufen interests. He also excommunicated Manfred. Faced with unrest in Rome and Manfred's armed threat, he retired to Viterbo and Anagni. From his residences outside Rome he extended his patronage to

the mendicant orders, defending their right to appoint the chairs of theology at the University of Paris. The Augustinian Hermits were organized under the papal aegis. Alexander canonized Clare of Assisi in 1255. He also sought, though unsuccessfully, a reunion between the eastern and western churches; and he tried to organize a crusade against the Mongols.

Al-Farabi

Al-Farabi (c. 870-c. 950) was born at Wasij near Farab in Turkestan. He studied in Baghdad under the Nestorian philosopher Yuhanna ibn Haylan. In 942, he went to Syria, where he was welcomed at the court of Sayf al-Dawla at Aleppo.

Al-Farabi was called the "second master"—that is, second after Aristotle—a title indicative of Al-Farabi's influence as a philosopher on the whole of Arabic and Latin thought in the Middle Ages. In the 150 years after his death, a period I. R. Netton (1992) has called the "age of Farabism," Arabic philosophy was shaped directly and distinctly by his thought. Through his Arabic and Hebrew successors as well as Latin translations of some of his writings, al-Farabi's influence on Latin medieval philosophy was equally notable.

Al-Farabi's *Book of the Enumeration of the Sciences* is the earliest known Islamic work on the classification of the sciences. Two Latin

translations under the title *De scientiis* were made in the medieval period, one by Dominicus Gundissalinus (Toledo, c. 1140) and the other by Gerard of Cremona (c. 1230). In this work al-Farabi analyzes the place and nature of all sciences, which he orders under eight headings: linguistic, logical, mathematical, physical, metaphysical, political, juridical, and theological disciplines, with extensive subdivisions for each category. These subdivisions are modeled after the earlier Aristotelian corpus, and the influence of Aristotle is also reflected in the primacy of logic. *De scientiis* in turn influenced Gundissalinus's *On the Division of Philosophy* (*De divisione philosophiae*, c. 1150).

A similar but less elaborate treatise, *On the Origin of the Sciences*, was also translated into Latin (as *De ortu scientiarum*), probably by Gundissalinus. Another work ascribed to al-Farabi was a commentary on Aristotle's *Rhetoric*, this commentary is preserved only in several Renaissance editions of the Latin translation by Hermannus Alemannus (c. 1256). At least in the early printed editions, al-Farabi's *On the Intellect* was often attributed to Avicenna. It was read by medieval western scholars in a translation, *De intellectu*, which may have been made by Gundissalinus. This unique work sets out to discuss the various meanings of the term "intellect" in Aristotle and common Arabic speech, but it is especially important for its interpretation of the active intellect in Aristotle's *On the Soul* (*De anima*). Like al-Farabi's *Philosophy of Aristotle* (which, however, was not translated into Latin), this treatise expounds the Neoplatonist view of the active intellect as the end point of a ninefold hierarchy of emanating incorporeal intelligences. By contrast, *De intellectu* describes the active intellect as a source of emanation of natural forms into the sublunar realm. The active intellect here also illuminates the human intellect in such a way that it can grasp concepts instead of mere general first principles. D. Salmon (1939) presents evidence for the existence of several other Latin translations of works by al-Farabi in the Middle Ages.

Alfraganus

Alfraganus is the latinized name of Abu'i-Abbas Ahmad Ibn Muhammad Ibn Khatir Al-Farghani (b. late eighth-early ninth century). Alfraganus was born in Farghana (Transoxania) and rose to fame in Baghdad as an astrologer-astronomer and engineer to Caliph al-Ma'mun of the Abbasid dynasty (813-833). As an engineer, Alfraganus

was responsible for the construction of the "Great Milometer" in old Cairo, which was completed in 861. However, he achieved his greatest renown as an astronomer.

Several of Alfraganus's astronomical works have not come down to us; these include *Book on the Construction of Sundials* and a commentary on the astronomical tables of al-Khwarizmi, which was mentioned by al-Biruni and Ibn ai-Muthanna and possibly provided the basis for the latter's extant commentary on these tables. By contrast, Alfraganus's *Elements* did survive and was popular both in the Arabic world and in the Latin west. *Elements* provides an unusually clear account of the mathematical astronomy of Ptolemy's *Almagest* (second century C.E.).

In the *Almagest*, Ptolemy had given a thorough analysis of planetary motions and had derived models and parameters that could serve as a basis for accurate predictions of celestial motions. A set of individual mathematical models, however, did not necessarily constitute a satisfying cosmological model, particularly in comparison with the Aristotelian homocentric universe. Alfraganus's contribution in *Elements* was to strip the *Almagest* of most of its mathematical content and offer a qualitative description of Ptolemy's models, along with certain basic parameters relevant for establishing the size of the universe. Thus an influential step was taken toward a generally acceptable synthesis of Ptolemaic astronomy and Aristotelian cosmology, in the form of a textbook that provided an excellent introduction to Ptolemy's mathematical astronomy.

Elements (known in the Middle Ages as *Compilatio astronomica*, *Liber de aggregationibus stellarum*, or *Liber 30 differentiarum*) was translated twice into Latin in the twelfth century, by John of Seville (1135) and Gerard of Cremona (before 1175). The first translation was printed in 1493 (Ferrara), 1537 (Nuremberg), and 1546 (Paris), the second only in 1910. A third Latin translation appeared in 1590 (Frankfurt); this was based on an undated Hebrew version by Jacob Anatoli. The Arabic *editio princeps*, with yet another Latin translation, appeared in 1669 (Amsterdam). The translation by John of Seville was particularly popular throughout medieval Europe, and it established an important tradition of introductory astronomy textbooks; the various *Theoricae planetarum* and Sacrobosco's *De sphaera* are part of this

tradition. *Elements* was quoted as early as 1282 in the *Composizione del mondo* of the elusive Ristoro d'Arezzo; and Paget Toynbee (1895) identified several instances in Dante's work that show the poet's acquaintance with Alfraganus's treatise. Moreover, *Elements* was the topic of public lectures by no less an astronomer than Regiomontanus at Padua in 1464. Alfraganus also wrote several treatises on the astrolabe that survive in a number of Arabic manuscripts.

Only Gerard of Cremona's Latin translation of the *Elements* has had the benefit of a modern printed edition (Campani 1910). Sabra (1971) provides a bibliography of other printed editions, as well as references to bibliographies of the extant manuscript material. A detailed overview of *Elements* can be found in Delambre (1819).

Allegory

Allegory—the term comes from the Greek *allos* (other) and *agoreuein* (public speech)—is an important means of writing and interpreting texts, which developed in various forms throughout the Middle Ages. Allegory is polysemous and challenges the reader to discover its multiple meanings.

In its simplest form, allegory is an extended metaphor in which the literal figures can be interpreted abstractly as well. This type, called reification allegory, was developed from the rhetorical tradition as exemplified by the Roman Quintilian (c. 35-100).

Typological allegory emerged from the tradition of biblical exegesis. Scholars of religion sought parallels between the Old and New Testaments: a woman, Eve, brought sin into the world but a another woman, Mary, brought us salvation; David was a king as Christ would be; and so on.

By the sixth century, another type of Christian allegory had emerged. This complex form has four levels of meaning, as later articulated by Dante in his *Convivio* and again in his *Letter to Cangrande*. These senses are (1) literal, (2) allegorical, (3) moral, and (4) anagogic. If we apply this to the biblical story of Jonah, the four interpretations are: (1)

a man spent three days inside a great fish, (2) Christ spent three days in the tomb, (3) God will save us from peril, and (4) God's plan is salvation by Christ.

A fourth tradition in the Middle Ages was the allegorical interpretation of classical texts, such as those of Virgil and Ovid, to give them Christian meanings. This was a means of recuperating the content of "pagan" texts that were widely used as schoolbooks to teach Latin. French and English authors wrote moral glosses on Ovid's *Metamorphoses*, a literary tradition to which Boccaccio's *Genealogie deorum gentilium libri* belongs. Similarly, "scientific" descriptions of beasts or precious stones inherited from antiquity were given a Christian interpretation; for example, the pelican piercing its breast to feed its young became a symbol of Christ's supreme sacrifice.

Ovid's *Heroides*, meanwhile, gave rise to another strain of allegorical texts. From the Provencal lyric to the romances of Chretien de Troyes, and most importantly in the *Roman de la Rose*, reification allegories sought to express the human emotions connected with amorous love. These texts, especially the *Roman*, had a clear influence on Italian authors. The late thirteenth-century Tuscan poem *Il fiore* omits the theological and scientific aspects of the French original, focusing instead on the erotic. This poem's attribution to Dante is still debated. The fragmentary verse *Detto d'amore*—by the same author, as is demonstrated by the similarity of its language—gives a larger role to the lady.

Most of the medieval Italian moral, didactic texts that use allegory are Tuscan, perhaps simply because there was a high level of literacy and book production in Tuscany. These texts include *Il detto del gatto lopesco*, a strange little poem, generally considered allegorical, about a species of wildcat making a pilgrimage to the Holy Land. The animal encounters two knights of the Round Table, spends a night with a hermit, and then passes through a desert wilderness where he encounters many savage beasts.

More important (and comprehensible) is the uncompleted poem *Tesoretto* ("Little Treasure") by Brunetto Latini. In this shorter Italian vernacular version of his *Livre dou trésor*, the poet-protagonist, recently exiled, seeks refuge in nature and meets its female personification, who rules the physical universe and who explains creation, the humors, the

elements, astronomy, animal species, rivers, and seas. In the second section of this poem, Brunetto crosses a huge desert before entering a delightful land ruled by the empress Virtue, whose daughters are the four cardinal virtues. Each daughter elucidates the positive attributes she represents; for example, Justice discourses at length on the proper behavior for a knight. This poem also contains echoes of the *Roman de la Rose*, especially in the section concerning the male character II Piacere (Pleasure). *Documenti d'amore* and *Reggimento e costumi di donna*, by Latini's near contemporary Francesco da Barberino, also use allegory for didactic purposes.

Perhaps the most intricate and most successful allegory ever created is Dante's *Comedy (Commedia)*. The author himself calls it his "strange allegory" (*Inferno*, 9:59-60). His poetic skill is capable of endowing even historical personages with symbolic significance. The pageant of the church scene at the end of *Purgatory (Purgatorio)* is an allegorical tour de force. Characters in his earlier *Vita nuova* such as the Lord of Love and Lady Compassion are analogous to figures in the *Roman de la Rose*. Some of Dante's love poems are allegorical, in reality celebrating Lady Philosophy, not an earthly ladylove.

The poem *Intelligenza*, once attributed (unconvincingly) to Dino Compagni, is the work of a cultivated Tuscan contemporary of Dante. This lengthy didactic poem has as its subject a lady who symbolizes and personifies Intelligence. Its encyclopedic content is stretched across a slender allegorical web: the poet visits her and describes her court, which includes queens, lovely damsels, and courteous maids-in-waiting. One room of her palace is decorated with stories of Caesar, Alexander, the Trojan war, and the Round Table. The salon represents the human heart, the vaulted ceiling represents the mind, and the walls decorated with scenes represent memories. Expressed in courtly terms, the poet's desire to love and serve this lady is entirely appropriate.

One notices that the personified figures in these allegories are predominantly female: earlier examples are Boethius's Lady Philosophy and Saint Francis's Lady Poverty. This may be simply due to the fact that the Latin and Italian nouns expressing such abstract concepts are often feminine.

A final example is *La giostra delle virtù e dei vizi*, from the late thirteenth century; it was written in the Marches, perhaps by a Franciscan, in epic style. Two cities—Jerusalem and Babylon—engage in a military confrontation; the virtues are the armor that protects the warriors of the Holy City, who are pitted against a long list of enemies, the vices. Allegory also appears in the letters of Saint Catherine of Siena.

Altichiero Da Zevio

Altichiero (c. 1330-after 1390) was already an established painter in March 1369, when he is first documented in his native Verona. All subsequent documents relating to Altichiero refer to his activities in Padua. The earliest of these documents—dated April 1376—has to do with an altarpiece in a church at Polverara, near Padua. That altarpiece and another one paid for in 1382 are lost or untraceable, and no other altarpiece panels currently attributed to Altichiero are actually by him.

Works

The earliest surviving documented works by Altichiero are some frescoes in the chapel of San Giacomo (now San Felice) in the basilica di Sant'Antonio in Padua; this was the mortuary chapel of Lupi, a soldier and diplomat serving the ruling house of Carrara. The contract for the architecture and sculpture in the chapel was signed in February 1372 by Bonifacio Lupi and the Venetian Andriolo de Santi. The original ledger survives and records work in the chapel from 1372 to 1379. The painting appears to have been done during the last two or three years. Altichiero, the only painter recorded by name, was paid for his work in the chapel (and for the decoration of the sacristy, now lost) in 1379. It is clear from stylistic evidence that another artist, working independently and not from Altichiero's designs, executed some of the lunettes—the first four and the sixth—depicting the legend of Saint James the Greater. Except for some marginal figures, the remainder of the decoration is by Altichiero: the other scenes of Saint James, the panoramic three-bay Crucifixion, the votive fresco, and the Annunciation, Resurrection, and Man of Sorrows.

The identity of the other artist is a subject of controversy. He was probably the Bolognese painter Jacopo d'Avanzo (or Avanzi), who is mentioned by some of the early sources—including the earliest, Michele Savonarola (c. 1446)—as having worked in the chapel. This seems to be the artist who is cited in Bolognese archival documents from 1375 to 1384, but it could instead be a Jacopo di Pietro Avanzi, who was already dead in 1378. The artist Avanzo (or Avanzi) who represented the brotherhood of painters in Padua in March 1405 appears to have been a different person; this is also certainly true of a homonymous painter recorded in Vicenza in 1379, 1380, and 1389. The Bolognese Avanzo signed a Crucifixion (now in the Colonna Gallery in Rome)—the basis for the attribution of the Massacre of the Hebrews, detached from the church of Sant'Apollonia di Mezzarata in Bologna and now in the Pinacoteca there. Twelve miniatures now in Dublin, illuminating Statius's *Thebaid*, have also been ascribed to Avanzo, but they may be by a close follower. (In either case, they cannot be a clear reflection of the lost frescoes by Guariento in the Carrara Palace in Padua, as is sometimes claimed.)

After completing the chapel of San Giacomo, Altichiero decorated the nearby oratorio of San Giorgio, a barrel-vaulted structure modeled on

the Arena Chapel. It became the resting place of Raimondino Lupi, who was Bonifacio's relative and, like Bonifacio, a soldier of Francesco da Carrara, lord of the city. The elaborate freestanding tomb has been much reduced. Documents show that the oratory was constructed by December 1379, possibly by May 1378, and that Altichiero finished his painting by May 1384. Other documents attest to his presence in Padua from July 1381 to 1384. The frescoes depict the legends of saints George, Catherine, and Lucy, with some scenes from the lives of Christ and Mary, and a votive image. Although it has been damaged by moisture, this is one of the most magnificent picture cycles of its century. The hand of Avanzo is not visible—we see only the hands of Altichiero and the expected assistants—nor is Avanzo mentioned in the documents. Yet it is sometimes claimed, on the basis of some of the early sources and an illegible inscription, that Avanzo's work is present.

The last record of Altichiero is a Paduan archival document of September 1384. At that time he was either in Verona or about to go there. The Florentine art historian Giorgio Vasari (1568) is the source of the tradition that Altichiero returned to Verona after working in Padua.

Vasari is the authority who tells us that Altichiero painted frescoes illustrating Flavius Josephus's *Jewish War* in the palace of the Scaligeri lords of Verona. Vasari writes that Avanzo also worked in the room, which he discusses before Altichiero's and Avanzo's Paduan works. This has given rise to the belief that the frescoes, for which there are no relevant documents, were done before Altichiero moved to Padua, for Cansignorio (1359-1375). Some portraits of Roman emperors and empresses survive and may be attributed to Altichiero, although these are not the subjects of the border medallions described by Vasari. They reflect a study of Roman coins, directly or indirectly through the illustrations of the *Historia imperialis* by the Veronese proto-immanist Giovanni de Matociis (Mansionario). The rest of the decoration is lost, though some drawings may reflect it.

The early sources mention the undocumented *Sala virorum illustrium* (Room of Famous Men) in the Carrara Palace at Padua. The sources give conflicting attributions: Guariento; Altichiero; Avanzo; and an artist by whom no documented works survive, Ottaviano (Prandino) da Brescia. The decoration was destroyed by fire and repainted with an altered scheme. The portion of the portrait of Petrarch which alone survives of the original decoration suggests that Altichiero worked in the room. Historical and literary evidence shows that the frescoes could not have been begun before 1367 and had been completed, or nearly completed, by January 1379. The decoration was based on *De viris illustribus* (*On Famous Men*), begun by Petrarch, finished after his death by Lombardo della Seta, and dedicated by both to Francesco da Carrara the Elder. The original program must have consisted of thirty-six figures of famous generals and statesmen from Romulus to Trajan, all but three of them Roman, with narrative scenes and inscriptions

beneath; portraits of Petrarch and Lombardo in their studies; and a Triumph of Fame. Assisting with this reconstruction are illuminations from two manuscripts of *De viris illustribus* in the Bibliothèque Nationale in Paris (Lat. 6069F and I) and one in Darmstadt (ms. 101). The Triumphs of Fame in the first two and an allegory of Padua and Venice in a third manuscript in Paris (Lat. 6069G) are often attributed to Altichiero, though it seems more likely that they were painted by his followers.

No sources or documents exist for the votive fresco of the Coronation of the Virgin on the tomb of Diamante Dotto, which was in the church of the Eremitani in Padua before it was destroyed during World War II, or for the votive fresco in the Cavalli Chapel in the church of Sant'Anastasia in Verona. Scholars unanimously attribute both to Altichiero, although they disagree on the dates. The first was probably painted around 1371, when Dotto died. The other was done before September 1390, when it was broken by another monument. It must have been painted after the chapel of San Giacomo in Padua, which its architectural background presupposes, and it may have been done after 1384, when Altichiero presumably returned to his native city.

Style and Influence

By about mid-century, the painters of Verona had absorbed the style of Giotto from nearby Padua, along with more recent Florentine and Sienese influences that seem to have been transmitted primarily through Riminese and Lombard intermediaries. With the exception of a polyptych signed by Turone and dated 1360, in the Castelveccchio, and some attributions based on it, the surviving works of this school are all anonymous.

Altichiero built on the local school, which had already naturalized the art of Giotto. Although he also knew the work of Maso di Banco and probably other Florentine followers of Giotto, he turned directly to the great example of Giotto's frescoes in Padua for the essentials of his own style. However, whereas Giotto's forms are abstract and timeless, Altichiero's figures are dressed in the costume of his time. Also, their features are more individualized than Giotto's, and the flesh tones are

more softly graduated. Altichiero was more sensitive to nuances of light, color, and surface texture. His figures are smaller in scale than Giotto's, relative to their surroundings and to the picture field; they are more numerous; and their distribution is more random and lifelike. Despite these differences, Altichiero retains Giotto's sense of monumentality and human dignity. His architectural settings, which were inspired by the Carrara court painter, Guariento, are more spacious and complex than Giotto's. But unlike these artists and others of their century, Altichiero generally avoided showing a structure with its front wall arbitrarily removed to reveal the interior; he preferred views more truthful to optical experience.

Altichiero, like Giusto de' Menabuoi, was probably called to Padua to fill the vacancy left by the death of Guariento. Altichiero, Giusto, and Avanzo (whose frescoes in Sant'Antonio are close to Altichiero and were influenced by him) were the leaders of a Giottoesque revival in Padua at a time when painting in Florence had stagnated, owing to a relaxation of Giotto's principles, Altichiero and, to a lesser extent, Avanzo had a dominant influence on painting and manuscript illumination in Padua and Verona that lasted to the beginning of the fifteenth century. This influence extended chronologically as far as Pisanello, Jacopo Bellini, and the Renaissance. Geographically, it extended beyond the Veneto as far as Austria and France, where the Limbourg brothers worked.

Amadeo VI, Count of Savoy

Amadeus VI (Amadeo, 1334-1383), the son of Count Aymon of Savoy and Violante de Montferrat, was born at the family seat of Chambery. Through earlier and subsequent genealogical and matrimonial ties, he was related to numerous royal and princely families of western Europe, and even Byzantium; but he belonged to a dynasty—the house of Savoy—that was, in the midst of terrible divisions, struggling to create the beginnings of a state in the rough, disconnected rural and mountainous territories in the western Alpine regions. Amadeo's grandfather, Amadeo V "the Great" (1285-1323), had begun drawing together

territories in areas long disputed between the French crown and the German empire and caught in a tangle of conflicting feudal claims by local ruling families. The house of Savoy itself was divided between the main branch of Amadeo V's line and the rival Savoyard line of the titular princes of Achaëa.

Amadeo was only nine in 1343 when his father died and he succeeded to the still rickety titles. Under a responsible regency of feudal relatives, he continued to receive a solid education in both military skills and intellectual disciplines, which developed in him a genuine religious bent shaped by the highest ideals of chivalry. In his early years, both under the regency and after his majority was proclaimed (in 1348, when he was fourteen), Amadeo gained experience in balancing the pressures of the French crown, the independence of his Swiss subjects, and the disloyalty of separatist vassals. In 1352, he won his first military victory. At a tournament held during the following Christmas season, his elaborate use of green robes and trappings earned him the sobriquet "Green Count"—a name that would last and an identity that he would continue to cultivate deliberately. By 1360, through both military and diplomatic assertion, Amadeo had expanded his territories in the western Alps, including significant areas of present-day France and Switzerland, and thus consolidated the western regions of the nascent Savoyard state. In many of these regions, he remained a vassal of the French king, whose cousin he took as his first wife in 1355; it was only by a turn of circumstances that Amadeo did not participate in the battle of Poitiers the following year and thus escaped being captured there with his overlord.

Amadeo was drawn meanwhile to protect the interests of his southern holdings in the Piedmont. Through the marriage in 1350 of his sister Bianca to Galeazzo II Visconti of Milan (Bianca and Galeazzo II became the parents of the great Gian Galeazzo), Amadeo developed cordial relations with the powerful Visconti family, eventually consolidating power over territories he had held in vassalage to them. He accomplished an uneasy subjection of his cousin of the Achaëa branch, Giacomo, whose territories he annexed and with whom he developed a long and bitter rivalry. This rivalry was extended to Giacomo's son Filippo, whom Amadeo was finally to destroy in 1368. In a campaign in 1363, Amadeo subjected his rebellious vassal the marquis

of Saluzzo. Two years later, Amadeo entertained the Holy Roman emperor Charles IV, who confirmed Amadeo's title of imperial vicar over areas that corresponded to much of the old kingdom of Aries. This status was more symbolic than real, but it allowed Amadeo to play off his dependency on the French crown against his vassalage to the empire.

In 1364, Amadeo was caught up in schemes for a crusade being fostered by Pierre de Lusignan, the king of Cyprus. Amadeo formally "took the cross" and organized a crusading Order of the Collar, signaling his new ambition to distinguish himself in this sphere. However, he was drawn away from Lusignan's project by an idea of collaborating with Louis the Great of Hungary against the Turks, who were progressing in the Balkans. He was also distracted by the needs of the Byzantine emperor John V Palaiologos (Palaeologus), his first cousin through their shared Montferrat links; Amadeo might have seen himself as a distant pretender to John's title. Leaving his wife as regent, Amadeo set forth in the spring of 1366, sailing from Venice with a substantial military force. John was himself visiting the Hungarian court when Amadeo set out for Constantinople. The Green Count undertook some immediate military operations on his way, compelling the Turks to surrender the crucial port city of Gallipoli, and then making a demonstration against the Bulgarian king, who was preventing John's return to his capital.

Amadeo's limited resources prevented anything more than token local military operations. Nevertheless, on the basis of discussions held during the winter, Amadeo persuaded John to appeal directly to Pope Urban V for more aid against the Turks. John achieved few practical results from this, but Amadeo established his own stature as an international diplomat and a valiant crusader. Following his triumphant return to Italy in the summer of 1367, Amadeo personally attended Urban V on his arrival in Rome from Avignon.

In the following years, Amadeo was caught up in the tangle of northern Italian politics, which were strained by the bold new ambitions of the Visconti, directed especially against the lands of Montferrat. By July 1372, Amadeo joined a broad alliance against the Visconti—the coalition included Pope Gregory XI; the princes of Montferrat, Este, and Carrara; the queen of Naples; and the republics of

Genoa and Florence, Accepting the command of the allies' forces, Amadeo broke the Visconti's siege of Asti and, in concert with the league's other commander, John Hawkwood, discomfited the enemy forces. In the spring of 1374, satisfied with his record, Amadeo withdrew from the league and became reconciled with the Visconti; but relations between the house of Savoy and the Visconti continued to be precarious. Through complex manipulations, Amadeo was able to annex considerable areas of Montferrat lands, although Gian Galeazzo Visconti, who was in power by 1378, retained Asti.

As he consolidated the Savoy lands, Amadeo began to develop orderly institutions for his nascent state. The Great Schism of 1378 brought the election of the French counterpope Clement VII, a cousin of Amadeo. Clement was naturally recognized gladly by Savoy, which benefited from his resolutions of some jurisdictional disputes. By 1380, Amadeo became concerned about the expansion of the latest war between Genoa and Venice; initially, this was a conflict over the Greek island of Tenedos, but it expanded into the "Chiogga war," with a scrambling of alliances that threatened the balance of power in northern Italy and encouraged the Visconti's aggression. Amadeo's offer of mediation was accepted, and his negotiation of the Peace of Turin (April 1381) established him even more firmly as a statesman of international stature. One faction in strife-ridden Genoa even offered Amadeo the protectorship of the city, with the title of doge. Meanwhile, with the Visconti momentarily checked again, Amadeo established his theoretical rights over Asti (though not actual control of it) and, more tangibly, secured possession of the important border city of Cuneo.

Amadeo is said to have dreamed of a new crusade, directly to the Holy Land. But his final adventure instead involved him in a scheme by Louis of Anjou to claim the throne of Naples, in collaboration with the efforts of Pope Clement VII to establish himself in Rome. In the spring of 1382, Amadeo set forth, marching through Italy into a badly mismanaged campaign that was foiled in part by John Hawkwood, who was now a Florentine captain in support of the Roman pope Urban VI, and Hawk-wood's Neapolitan ally Charles of Durazzo. Over the winter, Amadeo's forces were ravaged by disease, which finally took his own life (on 27 February 1383). His remains were lovingly transported back to Savoy for burial.

Though he was an occasional patron of Guillaume de Machaut and Francesco Petrarca (Petrarch), Amadeo VI was a man of war and statecraft rather than of culture. Shaped at first by the traditions of chivalry, Amadeo learned to blend them with the newer impulses of pragmatic realism. From his grandfather he inherited bare feudal elements which he began to fuse into a viable entity, balanced between the neighboring powers of France and Italy and acquiring prestige from his personal reputation. His grandson, Amadeo VIII, would further consolidate Savoy as a duchy, established in the natural capital of Turin and securely set on a course that would turn the once peripheral house of Savoy into a monarchy which would eventually unite Italy.

Amalasuntha

Amalasuntha (also Amalasuinthia, Amalasuentha, Amalaswintha; 498-535) was the daughter of Theodoric. In 515, she married Eutharic

Cilliga (d. 522; he was the son of Veteric, her uncle). This marriage reunited people of Amalian blood. Emperor Justin I (c. 450-527, r. 518-527) recognized Eutharic as a brother in arms, and they were joint consuls in 519. It was expected that Amalasuntha and Eutharic's issue—Athalaric and Matasuentha—would embody the central aspects of Theodoric's vision of leadership: pure Amalian blood and close ties to the Roman imperial system.

Upon the death of Theodoric, Athalaric (515-534, r. 526-534), a child of not more than ten, succeeded to the throne. Amalasuntha, by then a widow, ruled as regent and later as queen mother until Athalaric died. When she tried to educate Athalaric in the Roman literary tradition that she considered important, the non-Amalian nobility, who formed a determined opposition, chose that moment to demand the right to train their king as a "Goth." Even before Athalaric's death, Amalasuntha had set about freeing herself from the opposition of the nobles and securing some kind of recognition so that she could rule after her son. She eliminated several principal nobles and entered into discussions with Emperor Justinian. However, she could not rule without a male as king, and so, perhaps acting under the advice of the emperor, she offered the throne to her cousin Theodahad (d. 536; r. 534-536). The nobility supported Theodahad but rejected Amalasuntha's idea that she herself would continue to rule in his name. She went into exile on an island in Lake Bolsena in Etruria, where she was murdered (probably on 30 April 535) by the relatives of the Gothic nobles whose lives she had declared forfeit.

Amalfi

A western spur of the Appennines reaching the coast separates the Gulf of Naples from the Gulf of Salerno, in the form of a continuous rocky bastion that falls steeply down to the sea and is ridged by a few deep,

narrow canyons, formed by mountain streams heading seaward. Amalfi (with a population of some 6,000 around the year 2000) lies at the mouth of the funnel-shaped end of one such canyon, the Valle de' Mulini—a name referring to the numerous mills alongside the river that descends through the canyon and cuts through the city. Archaeological findings along the Amalfitan riviera include a number of villas from the Roman era, whose owners were attracted by the mild climate and the great beauty of the area. Most of the villas were destroyed by mudslides when Vesuvius erupted in A.D. 79 and were never rebuilt, and no established settlements have been found dating from before the founding of Amalfi in the sixth century.

There have been all sorts of fables about the origins of Amalfi, some enchantingly naive and some ingeniously devised to satisfy demands for historical realism. Interestingly, even in these fantasies the original settlers are always presented as merchants who found the site during their commercial travels. It is significant that no eponymous hero or saint is ever mentioned. In fact, like the patron saints of Venice and Bari, the protector of Amalfi, Saint Andrew, came to the city during a great expansion of its commercial routes, in the tenth century.

The first mention of Amalfi in recorded history is found in a letter written by Pope Gregory the Great in 596; from this letter we learn that a Byzantine stronghold existed there and had spawned a settlement large enough to warrant a diocese. A "*castrum* of Amalfi" is also mentioned by the geographer George of Cyprus in a work written between 591 and 603. The *castrum* (garrison town) was probably a base for the Byzantine fleet, which at the time maintained an active presence along the Tyrrhenian coast, and a defensive bastion against Lombard invaders who had penetrated the area and captured neighboring Salerno (625-649).

This revelation of the existence of Amalfi is followed by two centuries of silence, until 785, when Pope Hadrian I wrote to Charlemagne informing him that Amalfi, with help from Naples, had beaten back an attack by Duke Arichis II of Benevento, at the time the most powerful ruler in southern Italy. Thereafter, information about Amalfi becomes less sporadic, but it is still only episodic, allowing no more than a general outline to be drawn. In 812, an Amalfitan naval squadron was dispatched to assist the Byzantine commander in Sicily.

In the winter of 838-839, Amalfi fell into the hands of Duke Sichard of Benevento, who forced many Amalfitans to move to Salerno but then was assassinated by his own people in July 839. Taking advantage of the ensuing confusion and panic, some Amalfitans avenged themselves by looting Salerno and destroying its walls; they then returned to Amalfi. The issue of Sichard's successor led to a long and bloody war which at the end split the great duchy of Benevento apart. The Amalfitans supported Siconolf, Sichard's brother, and in a daring action freed him from the prison in Taranto where he had been held under an order by Sichard. When Siconolf became prince of Salerno, he showed his gratitude by granting a number of concessions to the large Amalfitan colony that remained there. Amalfi itself, which had commercial interests throughout southern Italy, soon came to terms with the other claimant, Radelchis of Benevento, who did not want it in his enemy's camp. The policy of neutrality, maintained strictly whenever possible, became traditional throughout Amalfi's history as an independent state.

The events of 839 marked a decisive moment for Amalfi. During the ninth century, its prosperity increased and its economic activities expanded. Its ships, with those of Naples and Gaeta, prevented the Arabs from gaining a foothold in Campania and then turned the Arabs away by defeating them at the battle of Ostia in 846. Amalfi's ruling families formed a web of marriage alliances with their counterparts in Naples, Salerno, Benevento, Capua, and the rest of the region. In 870, at the request of Emperor Louis II, Amalfitan ships rescued Bishop Athanasius, who was besieged by the duke of Naples, Sergius II, on a small island off the port of Naples. In 871, Amalfitan ships managed to bring desperately needed supplies to Salerno, which was besieged by an Arab force.

Arab mercenaries had first been introduced into southern Italy by Naples, to counter Sichard's aggression in the early 830s. They then became an indispensable tool of ambitious or fearful local rulers. Emperor Louis II fought valiantly but in vain to eradicate these mercenaries from the region. When he died in 875, his Carolingian successors withdrew from southern Italy. From then until 915, bands of Arab marauders raided the coasts of Campania and Latium and pushed deep into the interior, looting, killing, and leaving desolation behind

them. Naples, Gaeta, and Amalfi, however, actually benefited by offering shelter to the Arabs, selling them supplies, and buying their booty. The entreaties and condemnations of Pope John VIII (r. 872-882) were of no avail. Only the return of a strong Byzantine initiative early in the tenth century led to an alliance that finally, in 915, stormed and destroyed the Arab camp at the mouth of the Garigliano River. There is no evidence that Amalfi was among the Byzantine allies.

Until violent changes convulsed southern Italy in the second half of the eleventh century, the leaders of Amalfi steered a course of neutrality and cooperation that provided stability at home and safety for its merchants and commercial colonies abroad. The arrival of the Normans in the first quarter of the eleventh century, however, had upset a delicate political equilibrium. At first, the Normans were satisfied with their role as mercenaries in the service of local magnates; but as their number increased, with new recruits attracted by reports of successes, their goals changed. Ambitious, seeking riches, and no longer content to be soldiers of fortune, the Normans turned against their former employers, seizing their holdings and establishing in southern Italy a feudal kingdom that, in wealth and vitality, was unequaled in western Christendom.

Amalfi and Salerno had been enabled to develop from obscure fortresses to strong and very rich cities because of their close economic and social ties. They also had a common destiny when they fell. Amalfi was forced to accept Robert Guiscard as overlord in 1073, and Salerno fell to him in 1076 after a bitter struggle. Amalfi managed to regain its freedom for brief intervals until a final attempt was put down in 1131 by King Roger II.

Traditionally, Amalfi is referred to as a "maritime republic." The term is of modern coinage, and its implication of some form of popular governance does not correspond to historical reality. Early in the history of Amalfi a magistrate, called a *comes*, was chosen from among the noble families. During the ninth century, various men attempted but failed to seize power permanently, until Manso was able to establish a dynasty that persisted from 898 to 958. Its last ruler, Mastalo II, was assassinated by Sergius, the leader of a revolt, who in turn established a dynasty that ruled until Amalfi fell to the Normans in 1073. Evidently, until the establishment of the Manso dynasty the nobles of the duchy

had participated in the choice of the head of state; and even during the dynastic period their general interests and will could not be opposed or ignored for long with impunity.

From prehistory through the late Roman empire and beyond, trade between the eastern and western Mediterranean had always been dominated by eastern merchants. As late as the seventh century Syrian merchants, *Syrici mercatores*, were still numerous and well entrenched in the markets of Merovingian France and in Rome. Then they disappeared, as a result of a new alignment of forces reacting to the Islamic conquests. Their absence disrupted and radically changed a trade network that had operated for centuries. Soon, however, they were replaced by merchants from Campania and Venice among whom Amalfitans played a seminal role.

Geography was clearly a factor in the destiny of Amalfi. Its narrow territory offered scanty resources, and no large-scale movement of goods was possible because the area had no roads and could be reached only by sea or by difficult mountain trails. Thus maritime activity was not a matter of choice but a matter of survival. During their two centuries of historical anonymity, the Amalfitans had not been idle. When Amalfi reappears in documents, it is no longer an obscure *castrum* but a well fortified, prosperous town with considerable

shipping, and its merchants are already dominating the commerce of southern Italy. This is indicated by a peace treaty of 836 between Duke Sichard of Benevento and Naples: although its text has been lost, one entire chapter dealt with "How the Amalfitans should conduct their commerce" within the duchy, which at the time covered most of southern Italy.

Amalfi's commercial fortune has traditionally been explained in terms of its ties with the Byzantine empire, which allowed Amalfitans a quasi-monopoly on imports of expensive silk cloth, precious ornamental and ceremonial vestments, jewels, *objets d'art*, and other luxuries—items in great demand in western markets. Papal records, monastic chronicles, and reports of gifts from or to emperors, princes, and dignitaries bear ample testimony to this. On the other hand, it may seem difficult to explain where the Amalfitans got the gold needed for such purchases, since they had no wares that were in particular demand in Byzantine markets. For an answer, one must look at the needs of the rapidly expanding cities of North Africa, which were an ideal market for goods the Amalfitans could provide: agricultural products, linen cloth, hemp, naval stores, possibly slaves, and especially wood: all wood products, from household utensils to building materials, as well as wood for naval construction, which was sought especially by Arab rulers. It was from these markets—where, as in the Byzantine empire, only gold circulated—that the Amalfitans drew the gold which let them buy medical and aromatic spices, pigments and fixers, and many other items besides eastern luxuries. Such items were much sought after in Italian markets, particularly in Rome and as far north as Pavia. Notably, when western Christendom, after the reforms of Charlemagne, adopted the silver standard, only southern Italy was able to maintain the circulation of gold; and the Amalfitan *tari*, an imitation of the Arab quarter-dinar, circulated widely through the region from early in the tenth century until well into the fourteenth.

The most surprising aspect of Amalfi's trade was that the city itself was not its hub. The port of Amalfi was small and had no hinterland, and communications with the interior were so difficult that only highly valuable items—expensive silks, jewels, Oriental rugs, and the like—were brought there, besides foodstuffs and other necessities that could be shipped in with the necessary margin of profit. All the goods

exported on the first leg of the triangular trade had to be procured where they were available and then shipped directly to their destination: an overseas market. The procurement of export commodities and the distribution of imports from overseas were carried out by colonies of Amalfitan merchants, organized wherever there was a suitable market. Their extraordinary ubiquity and success are proof of the important role they played. Aside from their large establishments in Salerno and Naples, Amalfitan colonies could be found in many places in Italy (Rome, Benevento, Capua, San Germano, Aversa, Bari, Barletta, Trani, Molfetta, Venosa, Giovinazzo, Monopoli, Brindisi, Reggio, Messina, and Palermo); in Africa (Tunis, Tripoli, Alexandria, and Cairo); in the Middle East (Acre, Laodicea, and Antioch); and in the Byzantine empire (Durazzo, Almiro, and Constantinople). Amalfitan monks had a monastery on Mount Athos; and when the crusaders entered Jerusalem, they found several Amalfitan establishments that had been there for more than seventy years and were being maintained with alms collected in Amalfi. One of these was the Hospital of Saint John, from which sprang the Order of the Knights of the Hospital (or Knights Hospitallers), later of Rhodes and then of Malta.

Ibn Hawqal, a shrewd merchant from Baghdad, visited Amalfi in 972 and gave this description:

Then there is Amalfi, the richest city in Lombardy, the noblest and most illustrious for her condition, the busiest and wealthiest. The territory of Amalfi borders with that of Naples, which is a beautiful city, but less important than Amalfi.

When Amalfi was incorporated into the Norman state, it was exposed to hostility generated by the aggressive policies of the rulers, which led to the sack of the city by the Pisans in 1137. Unable to match the resources and naval power of Genoa, Pisa, and Venice, Amalfi began a slow decline into provincial anonymity; and on 24 November 1343, a sea storm destroyed most of the medieval city. Amalfi would not be rescued from its backward, decrepit condition until the advent of modern tourism, spurred by the construction of the famous Amalfi Drive.

Few buildings from medieval Amalfi survive today. However, the cathedral of Saint Andrew preserves certain elements of its twelfth-

century architecture, although it was extensively rebuilt, primarily in the baroque style, in the eighteenth century and its most familiar aspect, its spectacular facade, is actually a nineteenth-century creation. Its most notable medieval feature is a pair of bronze doors commissioned at Constantinople around 1065 by Pantaleone, son of the Amalfitan merchant Mauro. These doors are contemporaneous with a similar set of bronze doors at San Salvatore in the nearby town of Atrani. The cathedral's bell tower, built in 1180-1286, is topped with multiple cupolas that are a fine example of southern Italian decorative style. Adjacent to the cathedral is the Cloister of Paradise, which dates from the second half of the thirteenth century; its interlacing arches richly demonstrate the Christian assimilation of Islamic architectural features.

Ambrose, Saint

In Italy in the mid-fourth century, the place of Christianity was secure. The threat posed by Julian the Apostate had passed; Christianity held a favored position and was making many converts. Bishops were gaining prestige, and they increasingly acted as imperial officials, with civic as well as spiritual functions. However, Christianity would not be fully established as the official Roman religion until Theodosius's decree at the end of the century, and meanwhile certain religious questions remained to be resolved. What was the role of the old state paganism, which was intimately connected with loyalty to Rome? Within the Christian congregations, what was to be the accepted Christology? Perhaps most important, what was the relationship between church and state to be in the west? These were central issues, on which Ambrose of Milan (339-397) exerted an abiding influence.

Ambrose was born in Trier in Gaul, into a distinguished Christian Roman family. His father, Aurelius Ambrosius, held the highest possible civilian rank, praetorian prefect of the Gauls. Ambrose had two older siblings: a sister, Marcellina; and a brother, Uranius Styris. When Ambrose was an infant, his father died, and the family moved back to Rome. In 353, Marcellina dedicated herself to a life of virginity, receiving the veil from Pope Liberius. She continued to live at home, as was the custom among nuns in Rome at that time. Ambrose was strongly influenced by the piety of his mother and sister's Christian household.

In addition to his instruction in Christianity, Ambrose received a classic Roman education in which grammar and rhetoric were emphasized. In his mid-twenties, he began work as a lawyer. Around 370, his success in his civil career was ensured by his appointment as governor of the province of Aemilia-Liguria, which included Milan.

That career was interrupted, however, when Milan became involved

in a political and theological struggle between Arian and Nicæan Christians, who differed concerning the nature of Christ. The conflict had been precipitated by the death of Bishop Auxentius of Milan, an Arian, in 373; each faction wanted to capture the newly vacant bishopric. As governor, Ambrose used his considerable rhetorical skills to try to calm the antagonists, and his personal popularity overcame the doctrinal controversy. The congregation set aside its differences and took up the cry, "Ambrose Bishop." Over Ambrose's protests, Emperor Valentinian confirmed the election. Thus, in 373, Ambrose was baptized and consecrated bishop by a Catholic (not an Arian) bishop.

During his long episcopate, Ambrose confronted several issues that shaped the future of the western church: he was victorious over Arianism; he influenced emperors, demonstrating the force of religious authority over secular power; and he helped break Italy's ties to the old state paganism.

Ambrose, *Opera*. Paris, 1586. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

As we have noted, Ambrose took office during a dispute between Arian and Nicaean Christians. By the mid-fourth century, although Arianism was largely on the wane throughout the empire, it still retained pockets of strength—as in the confrontation over the bishopric in Milan. In northern Italy, there were many Arian Goths serving in the armies. Furthermore, Empress Justina was an Arian. On the death of her husband, Emperor Valentinian, who had been orthodox, Justina tried to use her influence to strengthen the Arian cause. The situation

was intensified in 378, after the Goths' victory at Adrianople, when more Arians entered Milan. These new Arians tried to take over a Catholic church for their worship.

Using his rhetorical skills and his popularity with his congregation to win his way, Ambrose repeatedly withstood Justina's efforts to support Arianism. He refused to obey a law extending liberty of worship to Arians, and he forbade Arians to convert the Catholic church for their own use. During the controversy, he wrote on religious matters in order to articulate the Catholic position. His theological tracts *Concerning the Holy Spirit* and *Concerning the Faith* educated Emperor Gratian in matters of faith and remained influential throughout the Middle Ages. Gratian's successor, the usurper Maximus, ended the Arian conflict in Italy by invading and forcing Justina to flee Milan. Ambrose's success in withstanding imperial pressure regarding Arianism set a precedent that far outlasted Justina and the dispute over the nature of Christ.

Ambrose soon became involved in a second controversy, concerning the state paganism that was entrenched in Italy. Under Ambrose's influence, Gratian was the first emperor to renounce the title *pontifex maximus*, and he passed laws that reduced state paganism from a public duty to a private belief. When Gratian died in 383 (or 384), a pagan party tried to reestablish the state's support of pagan temples. Ambrose opposed this party and continued to contravene any reestablishment of pagans' privileges. Emperor Theodosius yielded to Ambrose and in 391, forbade any pagan observances. Ambrose's uncompromising position helped bring about the end of formal state paganism in the west.

In his relations with Theodosius, Ambrose continued the policy he had established in his controversies with Justina. The bishop was the conscience of the empire, and his stand on paganism reflected that. Ambrose also challenged Theodosius over something that took place in Syria, thus claiming influence over matters outside his own bishopric. In 388, Syrian Christian congregations destroyed a Jewish synagogue at Caesarea. Theodosius ordered Christians to pay reparations to rebuild the synagogue, but Ambrose protested strongly, believing that no Christian should build a non-Christian place of worship. Because of Ambrose's popular support, Theodosius was again forced to yield. Ambrose's victory set another precedent for the future influence of the

church in state matters, and for future expressions of anti-Semitism.

In 390, Ambrose again demonstrated the political strength of the episcopate. As punishment for a riot, Theodosius had ordered a massacre of 7,000 Thessalonican citizens. Ambrose excommunicated Theodosius for this command and required him to do penance; by this act, Ambrose finally and firmly established the principle that bishops are responsible for the moral health of rulers. Here too, Theodosius yielded to the principle.

After Theodosius died in 395, Ambrose was no longer so actively involved in imperial politics, but the relationship between church and state that he had established in Milan remained a precedent for bishops and popes throughout the Middle Ages. Ambrose's treatise *De officiis ministrorum* (*On the Duties of Ministers*), which considered the relationship between the individual, the church, and the state, was widely used as a text during the medieval period.

Ambrose is also remembered as one of the Latin doctors of the church for his influence on the formation of church doctrine. His contributions as a theologian derive not so much from originality of thought as from his clear presentation of ideas, including Platonic biblical exegesis, developed in the eastern empire. Because of his stand against Arianism, Ambrose was the first western writer who specifically articulated the doctrine of the Holy Ghost (in *De spiritu sancto*), bringing eastern thought on this subject into the western church.

Ambrose was often called "doctor of virginity" for his advocacy of chastity as the ideal Christian way of life. He wrote several tracts on virginity (*De virginibus*, *De virginitate*, *De institutione virginis ad Eusebium*, and *Exhortatio virginitatis*), and through these and his sermons, he contributed (with Jerome) to a growing veneration of virginity in general, and to the development of the cult of the Virgin Mary in particular.

Finally, Ambrose—who had a pastoral concern for accessible church services—made a substantial contribution to liturgical music in the west. He began by introducing the practice of having two choirs chant psalms alternately; then he set psalms to music. Also, he wrote hymns to be sung by the whole congregation (instead of the traditional soloist). He is considered one of the fathers of liturgical music because, although

he was not the first to bring music into services, he popularized its use.

Ambrose was a man of high integrity and a strong sense of duty. He had come to the episcopate reluctantly; but once there, he never wavered from what he believed was virtue, and his actions left a powerful mark on western religion and society. His strong position as the spiritual leader of emperors set precedents that shaped relations between church and state throughout the Middle Ages. His doctrine moved Italy and the west toward the Nicæan Catholic view. His writings on virginity helped develop the anticarnal philosophy that has characterized western Christianity; and he was among those who filled the churches with Christian hymns. Ambrose continued to be an active pastor until he became ill and died on Easter eve, 4 April 397. He is buried in Sant' Ambrogio in Milan.

Ambrosian Chant

Ambrosian chant is the music indigenous to liturgy of the archdiocese of Milan. The term "Ambrosian" supposes an influence on the formation of this music by the great fourth-century bishop Ambrose. His biographer Paulinus, as well as his contemporary Augustine, tell us that in Milan, Ambrose introduced the singing of hymns and antiphonal chanting. A dozen hymns are said to be by Ambrose, but only four of these attributions seem secure, and the melodic tradition of all the hymns seems late. In the late nineteenth century and the early twentieth century, scholars were divided regarding the influence of the Ambrosian repertoire on other ancient western rites: some considered it the chant sung throughout Italy before the creation of the better-known Gregorian repertoire; some described it as an ancient body of chant from which were derived the other known non-Roman repertoires of the west (including the Gallican, Beneventan, and Mozarabic). A better understanding of the vibrant Italian chant tradition of the early Middle Ages has since led to a general view that the repertoire called Ambrosian is of a later origin than had been presumed, and that it was created under the influence of many other chant dialects. It is now

frequently called "Milanese" chant—a term that reflects its origin rather than its supposed founder.

Sources

Milanese chant is the only non-Roman repertoire other than the Spanish to have survived complete and fully notated. Public worship was divided between a winter and a summer church, a practice reflected in the complete sources, which are arranged as books for summer or winter liturgies. The books contain music for both the mass and the hours of the canonical offices. Three manuscripts are most frequently consulted: (1) London, British Library, Add. 34209, and (2) Milan, Biblioteca Capitolare F. 2. 2, for the winter services; and (3) Bedero di Val Travaglio, San Vittore B, for the summer. All date from the twelfth century, and their melodies can be reliably transcribed. A large number of less comprehensive sources also exist, the earliest dating from the eleventh century. An edition was prepared in 1935 by Dom Sunol for modern church usage, but it includes inauthentic material. An edition of the winter book appeared as Volumes 5 and 6 of *Paléographie musicale*, consisting of a facsimile of London, British Library, Add. 34209, and a transcription of the manuscript into modern musical notation.

Roughly contemporary accounts describe an Ambrosian liturgy rich in ceremonial pomp and spectacle. A twelfth-century Milanese ordo presents these celebrations in some detail as regards performance of the chant and the varying size of singing forces. This ordo was written by Beroldus, who oversaw the candles used in the frequent processions of the Ambrosian rite. In his descriptions, Beroldus often details the number of singers employed for particular celebrations, the money they are to receive, the specific chants they are to sing, and the place in the church where they are to perform. At times, even dynamic indications are offered, as in the following description of vespers:

The archbishop or priest, standing behind the altar, kisses it, after which he begins Vespers saying *Dominus vobiscum*. Then the weekly *terminarius* lector softly sings the *Lucinarium* (on Saturday only the beginning and the verse), followed by the *Magister* of the schola with his boys, who also sing

quietly. Then the lector begins again, followed by the chorus, all singing loudly.

Weakland (1966) noted a slightly later account of the Ambrosian liturgy by Landolphus, who describes a sevenfold repetition of an antiphon sung during processions on important feast days. Beginning with the sixth statement of the antiphon as the procession is just entering the building, Landolphus says: "The sixth time [the antiphon] is sung in the body of the church with great noise (*magno clangore*) and the seventh in choir with high, resonant tones [*vocibus altis atque sonoris*]." Weakland continues: "Frequent allusions are made by Beroldus to the fact that the verses of hymns and psalms were alternated between notaries and lectors or lectors and boys. [Landolphus] also indicates the repetition of the same piece by another section of the choir." On special feast days, a surprisingly large number of singers were involved: by Weakland's count a choir of 100 would not have been unusual.

The Repertoire

The chants of the Milanese Mass are often functionally similar to their Gregorian counterparts, but the genre titles are usually different from Roman and Frankish practice. The *ingressa* serves the role of the more familiar introit, but it differs from the introit in that it is not processional in function and thus has no psalmody associated with it. No separate Kyrie was sung in Milan; rather, the Kyrie was an addendum to the Gloria. The *psalmellus* is analogous to the Gregorian gradual. Because the Milanese retained the ancient practice of having three readings at the mass rather than two (as in the Franco-Roman rite), a chant called the *post-epistolam* followed the second lection, and the *post-evangelium* was sung after the reading of the gospels. The familiar Credo, Offertorium, and Sanctus followed, but there is no Milanese counterpart to the Agnus Dei. The *confractorium* was sung before the faithful took communion; the *transitorium* followed as the final chant. (No *Ite missa est* exists in the Milanese repertoire.)

The Milanese melodies, like the Old Roman and Beneventan

melodies, are often quite elaborate. In particular, the office responsories marked with the rubric *cum pueris* (or *cum infantibus*) contain highly decorative melismas or *melodiar*, some fifteen sets have been identified. Bailey (1987) has shown that these expansive melismas were often reused in other chants as well. Because Milanese chants are frequently ornate, it is often difficult to discern relationships between them and Roman and Gregorian counterparts with the same texts. There are clear associations, however. Huckle (1956) saw a closer relationship between the Milanese mode 2 graduals and their Gregorian counterparts than is evident from comparisons with the Old Roman versions and suggested that the Milanese melody derives from the Gregorian. Huglo (1956) cites some 360 pieces for both the mass and the office that were adopted from the Gregorian repertoire as transmitted in northern Italian sources. Bailey found that all the cantus (or tracts) of the Milanese repertoire are variations on a single type-melody, which is itself related to Old Roman and Beneventan melodies; he also sees common melodic ground between the Milanese alleluias and their counterparts in Rome, Benevento, and the Gregorian tradition.

Anacletus II, Antipope

When Pope Honorius II died in 1130, a rivalry between the Frangipani and Pierleoni—two Roman families—immediately surfaced once again, and this conflict was mirrored in the College of Cardinals. In a disputed election, the Frangipani faction elected Gregorio Papareschi as Pope Innocent II, while the Pierleoni faction elected Pietro Pierleone as Pope Anacletus II. A schism developed when neither Innocent nor Anacletus would resign. Anacletus managed to hold on to the city of Rome, and he also had the support of the Normans of southern Italy. In return for this support, he recognized Roger II, the Norman king, as king of Sicily by hereditary right. The schism was not healed until the death of Anacletus in 1138.

Anagni

Cathedral with statue of Pope Boniface VIII, Anagni. Photograph courtesy of Christopher Kleinhenz.

Anagni—one of the historic towns of the Ciociaria in the modern province of Frosinone—sits above the Sacco River valley on a rocky height in the hills southeast of Rome. The people of the ancient town fought and were conquered by the Romans in the fourth century b.c.e. (see *Aeneid*, VII.684: "dives Anagnia"). By the fifth century C.E. Anagni had already been designated a bishopric, and it became a site of considerable importance for the medieval church as an official country residence of the popes, as it had been for several Roman emperors, who

often took advantage of its relative proximity and its relatively healthy air. In the twelfth century, Thomas Becket was received by the canons at Anagni as he fled Henry II. At the Council of Anagni in 1160, Pope Alexander III pronounced the excommunication of Emperor Frederick Barbarossa along with the antipope Victor IV. Imperial representatives signed the preliminary *pactum anagninum* (1176) at Anagni after the defeat of imperial forces by the Italian Lombard League at the Battle of Legnano.

It was in the thirteenth century that Anagni earned the title "city of the popes." Four thirteenth-century popes came from Anagni: Innocent III (r. 1198-1216), Gregory IX (r. 1227–1241), Alexander IV (r. 1254-1261), and Boniface VIII (Benedetto Caetani, r. 1294-1303); Dante calls Boniface *queld'Alagna*, "the one from Anagni," in *Paradiso* 30.148. This small town therefore witnessed much of the intrigue that developed from the growing struggle between pope and emperor. Pope Gregory IX was host to Frederick II of Hohenstaufen in 1230 in the Conti family palace, which in 1295 became the palace of the Caetani, the clan of Boniface VIII.

Boniface remained attached to and supportive of his native city. He had a delicate constitution, and so he often retreated to his residence in Anagni to escape the stress of his turbulent reign and to scheme against recalcitrant European monarchs and Roman nobles. When his struggle with Philip IV (the Fair) of France reached a crisis in September 1303, Philip's minister Guillaume de Nogaret and the exiled Sciarra Colonna went looking for Boniface in his palace at Anagni. According to legend, Boniface donned the papal robes and ascended the throne to await his assailants, whose action became known variously as the "outrage" or "slap" of Anagni. For three days the pope's enemies laid siege to the palace and held Boniface hostage. He was eventually rescued by sympathetic townspeople, but he died shortly thereafter in Rome.

The palace can still be visited today, along with the nearby Palazzo Trajetto, which was Boniface's original residence. Also of interest in the medieval quarter of Anagni is the Palazzo Comunale (1159-1173) by the architect Jacopo da Iseo. There is a fourteenth-century statue of Boniface in the loggia of the cathedral (1071-1105, with thirteenth-century additions), which has significant thirteenth-century pavement mosaics by a member of the innovative Cosma family. The cathedral

treasury contains a wealth of items from Boniface's papacy, including an elaborate red silk cope.

Ancona

Ancona is situated on the Adriatic coast of Italy, about 132 miles (212 kilometers) northeast of Rome, at the eastern end of the central ridge of the Apennines. It is the principal city of the modern region of the Marche, or Marches. The name Ancona is from the Greek *anchon*, "elbow," and was derived from the mountainous promontory that forms the only significant natural harbor in the central reaches of Adriatic Italy. The city itself rises from the harbor up a northward-facing natural amphitheater between headlands to the east and west. Ancona has been a prosperous hub of commercial activity for most of its history. It serves as the main port for the agricultural products of its rugged but intensely cultivated hinterland. Merchants from medieval Ancona carried the

region's grain, wine, olive oil, and salted meat to urban markets in northern Italy, the eastern Adriatic, and the eastern Mediterranean. Medieval Ancona developed a silk industry, which flourished into the twentieth century. Throughout the Middle Ages, Ancona remained a viable commercial force despite the persistent efforts of Venice to remove it from competition.

Ancona was probably founded c. 390 B.C. by Dorian exiles from the tyranny of the elder Dionysius of Syracuse. It became an ally of Rome in the mid-third century B.C. and a *municipium* after the "Social War" of 90-88 B.C. In imperial times Ancona traded actively with Illyria and was the home port of a Roman naval fleet. With the collapse of the western empire in the fifth century after Christ, Ancona came under the protection of the emperors in Constantinople. Under Byzantine rule, it was the southernmost city of the Maritime Pentapolis—Rimini, Pesaro, Fano, Senigallia, and Ancona—and was subject to the exarchate of Ravenna. Heavily fortified, Ancona underwent many sieges throughout the Middle Ages. In 539, it held off an attack by the Ostrogoths; in 551, with the help of a Byzantine fleet, it thwarted Totila's attempt to take it; in the late sixth century, it repelled the Lombards. Unable to protect the Pentapolis directly, the Byzantine empire placed these cities under the duke of Spoleto in 728. Lombard kings quickly moved into the region, but they relinquished Ancona and several nearby cities to the papacy in 739 and 757. Charlemagne and Louis the Pious included Ancona in the territorial grants that they made to the papacy in 774, 781, and 816-817.

In 848, Saracens sacked Ancona after a long siege. The city rebuilt its defenses and became ever more heavily fortified as the centuries passed. In 876, Ancona acknowledged the overlordship of the pope. Emperor Otto III granted the eight counties of the Pentapolis to the papacy in the late tenth century; however, attempts by the papacy to rule Ancona failed, despite an interdict in 1059. Emperor Henry IV granted a march around Ancona to a Guarnerius c. 1090, and it remained in the hands of imperial designates until the beginning of the thirteenth century. However, the city itself fended off imperial control. Emperor Lothar III failed in his attempt to take the city in 1137. Ancona accepted Byzantine protection from the German emperors and Venice in 1155. It withstood a brief siege by Frederick I Barbarossa in 1167, but

imperial and Venetian military and naval forces returned to besiege the city in 1173-1174. The heroic and successful defense of Ancona by its citizens gave rise to many popular legends. Pope Alexander III granted near-autonomy to Ancona, a status confirmed by the Peace of Venice (1177).

Ancona was a semiautonomous commune from the twelfth century to the sixteenth. It was populous, prosperous, and usually strong enough to protect its maritime interests. Merchants from Ancona, many of whom were Jews, competed aggressively with the Venetians for business in the cities of the eastern Adriatic and established colonies in Constantinople, Acre, and Alexandria. The city negotiated commercial treaties with dozens of trading partners. Ancona routinely paid an annual census to its papal overlord and thus was never fully independent, but its government functioned much like those of other Italian communes, with a council of citizens and a public magistracy. It minted its own silver coinage, the *anconetano* or *agontano*, which circulated widely and became a model for other coinages in central Italy. Ancona was instrumental in the codification of the *statuti del mare* that regulated navigation in maritime Italy. The many substantial stone buildings in modern Ancona that date from the Middle Ages testify to the uninterrupted prosperity of the medieval city. These structures include the Duomo San Ciriaco (eleventh-thirteenth centuries), several other large churches, the Palazzo del Comune (thirteenth century), and the Loggia dei Mercanti (fourteenth century).

The ability of Ancona to deny Venice a monopoly over commerce in the Adriatic provoked the Venetians to attack it in 1183, 1229, 1257, 1274-1278, and 1428. The outcome of these wars was more or less favorable for Ancona, but by the beginning of the sixteenth century the city had been gradually forced to yield much of its commercial position to Venice. A continuing weakness of Ancona was its inability to extend its territorial control into the Marches. The papacy resumed lordship over the March of Ancona under Innocent III (1198-1216), who granted it in fief to Azzo IV d'Este in 1208. The Estensi held it until 1233, when Pope Gregory IX replaced them with a papal rector. Frederick II sent his son Enzo to seize the Marches in 1239, and imperial vicars governed them until the emperor's death in 1250. Manfred of Sicily controlled the Marches from 1258 until his death in

1266, when the papacy reasserted its claim.

Papal jurisdiction over the Marches in the late thirteenth century and the early fourteenth century was often little more than a legal fiction, but Ancona was still unable to push its influence into the Marches. Its chief obstacle was not the papacy but the intense opposition of its nearest rivals, the middling and smaller walled cities of Fermo, Iesi, Legato, Macerata, Osimo, Pesaro, Recananti, and Senigallia. During the thirteenth, fourteenth, and fifteenth centuries, Ancona fought numerous inconclusive wars with its neighbors. From one conflict to the next, alliances shifted, turning allies into enemies and back again. These wars prevented the Adriatic Marches from developing a regional identity strong enough to contest the claims of a resurgent papacy in the fourteenth and fifteenth centuries.

During the early decades of the Avignon papacy (1305-1378), several *signori* established lordships in the Marches, including a brief Malatesta *signoria* in Ancona. In the 1340s and 1350s, Cardinal Albornoz recovered much of the Romagna and the Marches for the papacy. Revenues from the city were an important factor in the successes of the papacy during the mid-fourteenth century. Indeed, Ancona paid as much as half of its communal revenues as tribute to the church from the mid-fourteenth century until its full incorporation into the papal state in the sixteenth century. In 1357, Albornoz convened the Parliament of Fano, at which he issued the *Constitutiones marchiae anconitanae* that served as the basic law of the papal state until the time of Napoleon.

Ancona continued to negotiate independently with its trading partners and competitors into the sixteenth century, but the political and fiscal subordination of the city to the papacy was an accomplished fact by the end of the papal schism in 1417. Occasionally, strongmen such as the Ferretti could dominate local government and had a fairly free hand in the *contado*, but papal rectors collected taxes from the commune throughout most of the fifteenth century. In the 1430s, the *condottiere* Francesco Sforza took control of Ancona and the March. The March returned to direct papal jurisdiction in 1446, but Sforza continued to dominate the city into the 1450s. The papacy suppressed what remained of the communal autonomy of Ancona in the sixteenth century. Significantly, the papal keys appeared on the reverse of the *anconetano* under Pope Julius II (1503–1513). In 1532 Pope Clement VII,

who was financially pressed, sold the revenues of the populous and prosperous city to Cardinal Benedetto Accolti for 20,000 gold *scudi*, and the pope ordered his legate to take and rule the city directly. Except for the brief Napoleonic interlude, Ancona remained an integral part of the papal state until the forces of the kingdom of Italy captured it in 1860.

Andalò Di Negro

The Genoese astronomer Andalò di Negro (c. 1260-1334) is also known as Andalone Negro or Andalo de Nigro. According to Sarton (1947), Andalò owes his fame to the "enthusiastic, incompetent, and uncritical praise" of his most illustrious pupil, Giovanni Boccaccio. However, Andalò was well trained in the Ptolemaic and Arabic schools of astronomy and was also a successful diplomat. In 1314, he negotiated for Genoa an advantageous treaty with Alexius II Comnenus, emperor of Trebizond (the Turkish town of Trabzon on the Black Sea). Four years later, when Genoa became part of the domain of King Robert of Anjou, Andalò joined the Angevin court in Naples. It was there that he taught astronomy and astrology to Boccaccio. Boccaccio, in fact, transcribed Andalò's *Tractatus sphaerae* in his *Zibaldone medicea laurenziana* (Plut. XXIX, 8), and used Andalò's *Introductorius ad indicia astrologie* (unedited) as his primary astrological source for his own early works. Besides these two treatises, Andalò also wrote a dozen other works, including several tracts on the relationship between medicine and astrology, one on the astrolabe, one on the theory of planets, one on the distances of all the other planets from Earth, and one on the *Almanack* of Profatius Judaeus.

As the leading astronomer in both Genoa and Naples, Andalò, through his teaching, spread Ptolemaic Arabic astronomy in these two

important cultural centers. Scholars concur that his knowledge of contemporary astronomy was thorough and precise, as are many of the corrections he made to some important astronomical texts of his time. Thus Andalò is sometimes seen as a precursor of the scientific experimental methods that would become prominent in the fifteenth century. As for his astrological philosophy, Andalò believed that the judgments of astrology were not necessary but contingent: they depended as much on the disposition of the patient as on the actions of the agent. In the words of Thorndike (1934), Andalò "serves to illustrate the point that the occult arts and sciences were then supported by men of the highest education and learning and not merely by the vulgar and charlatans, and that astronomy and astrology were indistinguishable then."

Andrea Da Barberino

Andrea da Barberino (c. 1371-c. 1431), a son of Jacopo di Tieri de' Magnabotti from Barberino in Val d'Elsa, was a prolific writer and compiler of chivalric narratives in Tuscan prose. Andrea lived and wrote in Florence, where he owned a house. His vast cycle of nine works is modeled on French and Franco-Italian epics in the Carolingian cycle but also shows the influence of the Arthurian romance cycle. In addition to his published writings listed below, there are two other texts probably written by him—*La storia del re Ansuigi* and *Storia di Rinaldo da Montalbano*, both still unedited—and his *Prima Spagna*, which has been lost. His best and most original work, commonly known as *Guerrirto il meschino*, has been printed numerous times, but there is still no reliable edition.

According to contemporary scribes, Andrea recited his narratives in the piazzetta San Martino in Florence; but they were also intended for private reading, as is clear from the author's appeals to the "reader" and from numerous extant manuscripts. Manuscript evidence and library inventories reveal a range of readers from shoemakers and tradesmen to kings and princes. Although his texts were best-known in Florence and Tuscany, *Guerrino* circulated in many other areas, including Ferrara, Bologna, Venice, Umbria, and Naples, and it was translated into French and Spanish in the early sixteenth century. Andrea's works were still being published and copied after the great chivalric epic poems by Boiardo and Ariosto had appeared.

In contrast to the French epics on which they were modeled, Andrea's narratives have a less austere and more human tone. Although Andrea says that he translated these works from French, and this statement is supported by philological studies, his process of translation was not slavish. Instead, he freely adapted the material, expanding, abbreviating, and innovating as he worked. Despite the prevalence of *ottava rima* in narratives of Carolingian material, Andrea seems to have selected prose as more appropriate to his purpose: he wanted to create an epic cycle more closely related to actual chronicles than to fictional material. Accordingly, he strove for verisimilitude, providing extensive genealogies for the heroes, linking all the works

chronologically in a vast cycle, furnishing dates for the events portrayed, and including realistic details. However, even though he is concerned with pragmatic descriptions, his prose remains fresh and interesting and his language attains a certain gentility. In some scenes he creates suspense rather successfully. His occasional humorous touches are mild and tasteful, never crude or burlesque. While many of the characters and episodes in Andrea's works were already commonplace in the semipopular *cantare* literature of the time, his style is more learned than that of other *cantastorie*. Like the *cantari*, his "histories" present abundant action and adventure; but his characters, unlike those in the typical *cantari*, are sensitively drawn and psychologically nuanced.

Because of his huge output, his distinctive voice, and his long popularity, Andrea's work holds an important place in Italian cultural and literary history. Although his prose lacks the virtuosity of the Renaissance epic poems, his influence on later chivalric authors was nevertheless greater than has previously been recognized.

Andrea Da Firenze

The composer Andrea da Firenze (d. c. 1410) is known variously as

Frater Andreas Organista de Florentia, Fra Andrea di Giovanni, Andrea dei Servi, and, most commonly, Andreas de Florentia. Of the final generation of musicians of the *Trecento*, he is perhaps the best-documented biographically. Though we have no information about his birth or background, he was presumably Florentine, and we know that he entered the Servite order in 1375. In 1378, he became organist at the order's monastery in Florence, Santissima Annunziata; from 1380 to 1397, he served intermittently as its prior, and also as prior in Pistoia (1393). He eventually (1407-1410) became the head, or provincial, of the Servite order in Tuscany. Evidently he died c. 1410.

As both composer and organist, Andrea became a colleague and collaborator of his distinguished older contemporary, the blind organist Francesco Landini, and we know that they worked together on two organ-building projects: one for the Annunziata in 1379 and the other for Florence's cathedral in 1387. (There is a record of a "Maestro Andrea" who was charged with building an organ in Rieti, near Rome, in 1382, but it is not certain that this was the same person as Andrea da Firenze.)

Andrea was one of the latest composers to be included in the great Squarcialupi Codex, which contains a presumed portrait of him playing an organetto. Indeed, it has been argued that he may actually have prepared the manuscript of this remarkable compilation. Whether or not that is true, the codex is the main source for Andrea's surviving output, a total of thirty *ballate*, eighteen of them for two voices and twelve for three voices. (Other sources give a French *ballade* for three voices and an Italian madrigal for two voices, but their attribution to Andrea is dubious.) Andrea seems to have composed the Italian texts himself, on amorous, moralizing, or polemic themes. His apparently exclusive preoccupation with the *ballata* form, by then regarded as old-fashioned and generally ignored by others of his generation, marks him as an unusual traditionalist for his time. Nevertheless, despite all the conservative elements of his style, which was firmly rooted in the traditions of his friend Landini, Andrea's technique clearly shows some French influences, and his use of finely detailed imitation conveys a nervous pulse that goes beyond Landini, whose texture is much smoother. Thus Andrea may be considered the true concluding figure of the Tuscan *ars nova* tradition, in contrast to the more unconventional,

cosmopolitan, and progressive composers of his generation such as Antonello da Caserta, Johannes Ciconia, and Matteo da Perugia.

Andrea Di Bonaiuto

Andrea di Bonaiuto (c. 1325-1379) was a respected and successful

painter active in Florence after the black death; he is also known as Andrea da Firenze (but should not be confused with the composer Andrea da Firenze). Unfortunately, only a few archival entries refer to Andrea di Bonaiuto by name, and this of course hampers any attempt to reconstruct his career or personality.

Andrea matriculated in the Florentine painters' guild in 1346; this would suggest a date of birth sometime around 1325. He lived in the parish of Santa Maria Novella and seems to have been influenced by the work of Nardo di Cione, with whom he may have trained. He left Florence in 1355 to work in Pisa, where he stayed for roughly ten years. When he returned to Florence, he received the most important painting commission of the 1360s.

In December 1365, Andrea accepted an offer to decorate the Dominican chapter house of Santa Maria Novella, built sometime around 1350 and funded in part by the estate of Buonamico di Lapo Guidalotti. To compensate Andrea, the Dominicans provided him and his wife with a house next to the church and a generous stipend. The agreement called for the artist to cover the four walls and the ceiling vaults of the chapter house with frescoes within a two-year period. Andrea appears to have met this deadline.

Probably as a result of this commission, Andrea was simultaneously appointed to a committee planning the design for the dome of the cathedral of Florence. He served on this board for two years, completing his term in 1367. He then spent a brief time in Orvieto before returning to Florence, where he painted a panel of Saint Luke for the hospital of Santa Maria Nuova in 1374. In 1377, he accepted a commission to paint an altarpiece in Pisa, and then stayed in Pisa long enough to execute a fresco (now damaged) in the Camposanto. He died in 1379, leaving only a paltry estate for his widow and his one child, Bartolomeo.

Because almost none of his other works survive, Andrea's murals in the chapter house of Santa Maria Novella, commonly referred to as the Spanish Chapel, stand as his greatest paintings. This cycle—probably based on ideas expressed by Fra Jacopo Passavanti of Santa Maria Novella—celebrates the spiritual and intellectual achievements of the founder of the Dominican Order and his disciples. The central image, on the north wall facing the entrance, depicts scenes from the passion

of Christ. The Way to Calvary, Crucifixion, and Harrowing of Hell are placed in a continuous frieze running from one end of the lunette wall to the other. Flanking this space on the west wall is an image of Thomas Aquinas, enthroned, presiding over allegorical representations of the cardinal virtues and the liberal arts. The Via Veritatis decorates the east wall, with Dominic, Thomas, and Peter Martyr converting heretics, providing spiritual guidance to the devout, and leading the faithful into heaven. An architectural portrait of the cathedral of Florence, complete with an envisioned octagonal dome (the actual dome had yet to be constructed), serves as a backdrop to this scene; it may have been a result of Andrea's membership on the committee planning the dome. Scenes of the Navicella, Resurrection, Ascension, and Pentecost occupy the vaults above, providing theological analogies to the images below.

The choice of Andrea di Bonaiuto as the painter of the Spanish Chapel suggests that he was one of the most important artists of the day; his appointment to the committee planning the dome of the cathedral indicates that he was highly respected by Florentine civic leaders. There can be no doubt that Andrea was recognized as a major figure in his native city during this period, and his works in Santa Maria Novella are one of the great decorative programs of the late *Trecento*. But the paucity of signed or dated paintings leaves us with only a meager understanding of the artist's abilities, interests, and influences.

Andreas Capellanus

Andreas Capellanus was a writer of the late twelfth or early thirteenth century whose identity remains enigmatic. Although most manuscripts call him *Andreas regis Franciae capellanus* ("Andreas, chaplain of the king of France"), no chaplain of that name is known during this period at the court of France. Pio Rajna discovered an Andreas who from 1185-1187 was the chaplain of Countess Marie de Champagne, daughter of King Louis VII and Eleanor of Aquitaine; however, there was also an Andreas "Cambellanus" in Paris, attested to between 1190 and 1201. In any event, Andreas Capellanus was a cleric well versed in the scriptures who probably wrote, between 1181 and 1186, the Latin treatise *De amore*, representing a fusion of the theories expressed by Ovid in *Ars amatoria* and *Remedia amoris*. The work is dedicated to a supposed friend of Andreas's, Gautier (Walter); this might very well have been Gautier de Nemours le Jeune (b. 1163), son and successor of Gautier the Chamberlain, himself very much in favor with Philip II Augustus, with whom the younger Gautier started his public career c. 1190.

De amore consists of three books. The first book explains the nature of love, clarifies who is qualified for love, and illustrates these topics with dialogues that distinguish between the love of men or women of the same and of different social classes. The second book, "How to Keep Love," is presented as twenty-one judgments. The third book deals with the condemnation of any love that is not the love of God. The ladies who pronounce the judgments of love in Book 2 were among the most famous in the kingdom during the late twelfth century, and all belonged to the same family: they were Marie, countess of Champagne; Eleanor (Alienor) of Aquitaine; Eleanor's mother, Elizabeth of Vermandois, countess of Flanders (a relative of the French queen); and Ermengard, viscountess of Narbonne. Their consensus is that marital affection and

the true love of lovers are wholly different and derive from entirely disparate sources. Andreas does not write for these ladies but rather uses them to mock a new literary trend called "courtly love," because it also results from an Arthurian (i.e., secular and hence frivolous) story, appended to Book 2, which concludes with thirty-one ridiculous rules of love, such as, "Marriage is no real excuse for not loving," "One who is not jealous cannot love," and "No one can be bound by a double love."

Although *De amore* is preserved in more than thirty manuscripts, it seems to have begun to circulate relatively late. It is first quoted by Albertano da Brescia in 1238—under the title *Liber Gualteri*—in Albertano's *Liber de amore Dei et proximi*. After 1295, it is quoted by Geremia da Montagnone in his *Compendium moralium notabilium*. Both of these works are theological and moral in nature. Among the Old French works treating the art of love, however, only Jean de Meung's *Roman de la Rose* mentions *De amore*. Toward the middle of the fourteenth century, *Art d'amours* by Jacques d'Amiens is somewhat influenced by *De amore*, which seems to have been read nearly exclusively by clerics and jurists.

De amore is a disconcerting work, and on 7 March 1277, the bishop of Paris condemned it. But there were several adaptations in the vernacular, such as the last part (*Ci se demande la doctrine d'amor*) of the Franco-Italian *Livre d'Enanchet* (c. 1250). There were also two versions in Tuscan prose: the *versione fiorentina*, dating from the mid-thirteenth century, is preserved in four manuscripts; and the *versione barberiniana*, adapted between 1309 and 1313 by Francesco da Barberino in his *Documenti d'amore*, is preserved in one manuscript.

Angela Da Foligno, Saint

Angela (1248 or 1249-1309) was born into a wealthy family in Foligno. She underwent a conversion after her mother, husband, and children died c. 1288, and her renunciation of worldly goods and increasing devotion thereafter to a life of penitence and good works eventually led her to become a tertiary in the Franciscan order (1290–1291). From this time on she experienced numerous visions, especially of the suffering and death of Christ; one very public *raptus* during a pilgrimage to Assisi, in which she had a vision of the Trinity, caused some controversy. She dictated these visions (presumably in the vernacular of Foligno) to her confessor, Arnaldo, whose written version (in Latin), *Memoriale*, prepared between 1292 and 1296, became widely popular and influential in late medieval Italy. It was approved in 1296 by a Franciscan theological commission headed by Cardinal Colonna. As her reputation grew, Angela attracted many followers, and she was visited in 1298 by the leading Spiritual Franciscan Ubertino da Casale, who mentions her with gratitude in his *Arbor vite crucifixe Jesu*; among her

surviving texts is a letter to Ubertino, dating from 1302. She continued to have visions, including a famous experience at the Portiuncola in 1300. She was beatified in 1693.

Angela's dictated writings were collected in *Liber sororis Lelle de Fulgineo* (*Book of Sister Leila [Angela] of Foligno*), also known as *Liber de vera fidelium experientia* (*Book of the True Experience of the Faithful*). This consists of the *Memoriale*, various sayings, moral precepts, advice, letters, and some shorter accounts of visions. Vernacular works, including the *Via delta salute* (*Way of Salvation*) have been attributed to Angela but appear to be a product of her admirers.

Angela's mysticism owes much to the Victorine tradition and to Bonaventure but has a force and originality of its own, centered on Angela's concept of Christ's encouragement to the believer to ascend through various levels of mystical experience to the point of identification with Christ himself.

Angelo Clareno

Artgelo Clareno (or Chiareno) was bom at Fossombrone between 1247 and 1255 and died in 1337. He led an extraordinary life and was at the

heart of a bitter dispute between the Spiritual Franciscans and the Official or Conventual wing of the order. Angelo became a Franciscan as Pietro da Fossombrone in 1270 and immediately allied himself with the Spirituals; he was persecuted, imprisoned, and finally sent, apparently for disciplinary reasons, on a mission to Armenia (1290). In Armenia, he encountered opposition from the Conventuals already working there, and he was driven back to Italy in 1294. He attempted to found a community of his own in Italy, to perpetuate the strict observance of the Franciscan rule, and at this time took the name Angelo Clareno ("angelic trumpet"). He was initially encouraged by Pope Celestine V, but after Celestine's brief reign he was firmly discouraged and then again subjected to persecution by the succeeding pope, Boniface VIII. Further travels and tribulations followed: Angelo went on a pilgrimage to Greece in the early 1300s; was back in Italy in 1304-1305; and in 1311, having been named leader of the Spirituals in 1307-1308, went to the Council of Vienne to advocate their cause, with some success. He was persecuted yet again under Pope John XXII after 1316 and was imprisoned in Avignon, but he soon obtained his release, at the cost of surrendering his membership of the Franciscan order. He returned to Italy in 1318 and continued to work on behalf of the Spiritual Franciscans under the protection of the sympathetic abbot of Subiaco. But the church remained hostile, and eventually Angelo took refuge in Basilicata, where he lived in poverty and sickness until his death.

Angelo's writings, all in Latin, include several translations from the Greek fathers, a rule for the Spiritual Franciscans, spiritual treatises, letters, and *Historia septem tribulationum Ordinis Minorum* (*History of the Seven Tribulations of the Order of Friars Minor*). Many of these were quickly turned into vernacular versions and circulated widely during the *Trecento*.

Angevin Dynasty

The first Angevin dynasty was the ruling house of the kingdom of Naples and Sicily established by Charles I, Count of Anjou and Provence, in 1266. Although Charles II ceded the county of Anjou to Charles of Valois in 1290, the dynasty retained the name Angevin. The second Angevin dynasty was founded by Louis, second son of John II of France; it claimed the succession in the Regno—the kingdom of Sicily—in the late fourteenth and fifteenth centuries.

Although the Angevins lost Sicily following the Sicilian Vespers in 1285, they continued to claim it except for ten years after the Treaty of Caltabellotta in 1302. Charles II had thirteen children, of whom the eldest, Charles Martel, yielding his claims to the throne of the Regno, inherited his mother's rights to the throne of Hungary, which finally passed to his son, Charles Robert (Carobert, crowned in 1310). Charles II's next son, Louis, bishop of Toulouse (d. 1296), was later canonized. Louis is the subject of a painting by Simone Martini which also includes an allegedly faithful portrait of his next brother, Robert, who in 1309 succeeded Charles II as king of Naples and Sicily. Younger brothers were provided with appanages in the Regno. Two of them—John, duke of Gravina (later prince of Durazzo); and Philip, prince of Taranto—had children who became involved in bitter struggles for power during the reign of Robert's daughter and heir, Joanna I. John's grandson, Charles III, ultimately deposed Joanna and became king (1382-1386). He was succeeded in turn by his son Ladislas (d. 1414) and his daughter Joanna II (d.1435). Joanna, being the last descendant of Charles I, recognized as her successor first Louis II and then his brother Rene of Anjou of the second dynasty. They were not relations: Charles of Valois's son Philip

became king of France, thus bringing Anjou back into the hands of the French monarchy. It was granted as a new appanage by King John II to his second son, Louis I, father of Joanna II's heir. Louis I himself had been recognized as the heir of Joanna I and by right of this claim had conquered Provence, which was separated from the Neapolitan kingdom in 1381. His sons, Louis II and Rene, retained Provence but were unsuccessful in Naples, where Alfonso V of Aragon, who already ruled Sicily, seized the mainland (1435-1453). The Angevin claim was not forgotten, however. Rene died in 1480 and left it, with Provence, to his nephew Charles of Maine, who himself died a year later leaving all his claims to his cousin, King Louis XI of France, the son of Rene's sister Marie. Louis XI's claim was inherited by his successors and became one excuse for the invasion of Italy by Charles VIII in 1494. That invasion started the prolonged Italian wars of the sixteenth century.

Angilberga, Empress

Angilberga (Engelberge, d. 891), a member of the powerful northern Italian Supponid family, married Louis II of Italy (son of the emperor Lothair I) in 851. When Louis succeeded his father in 855, Angilberga became his very active consort, sharing the numerous tasks necessary for a Carolingian king to assert himself among the fractious Italian nobility and against the grasping hands of Louis II's uncles, Charles the

Bald of France and Louis the German of Germany.

Although Louis II was not known for making generous land grants, he nonetheless made many grants to Angilberga, including the monastery of the Holy Savior at Brescia with its numerous dependencies and the abbey of Saint Peter near Piacenza. Louis died in 875 leaving no male heirs, and thereafter Angilberga's position was much reduced; however, she fought vigorously for her possessions against those who would have taken them from her. In this struggle, she had the support of Pope John VIII, but even John could not prevent Charles the Fat—son of Louis the German (who had secured the crown of Italy)—from sending her into exile in 880–882 because of her presumed meddling in politics. All her possessions were later confirmed by Charles.

Anonimo Genovese

Though his true identity remains unknown, it seems likely that the poet called Anonimo Genovese was a government official or notary affiliated with the Congregazione di Santa Caterina d'Alessandria in Genoa. His work, probably composed c. 1270-1311, survives in a single manuscript known as the Molfino. The 181 poems (147 in the vernacular and thirty-four in Latin) vary widely in theme and style, from hagiography and didactic verse to invectives, patriotic panegyrics, and humorous anecdotes. The style, both learned and accessible, is persuasive and often remarkably candid. After Raimbaut de Vaqueiras, Anonimo Genovese was the first to use the Genoese dialect for serious literary purposes.

Anselm of Aosta, Saint

Saint Anselm of Aosta (1033 or 1034-1109) was a Benedictine monk, theologian, and archbishop. He was born the son of a Lombard nobleman in the Alpine town of Aosta and spent his early years in Italy, but he received his monastic education at the abbey of Bee in Normandy. At Bee, he succeeded Lanfranc as prior in 1063 and was elected abbot in 1078; thus in France he is known as Anselm of Bee. He eventually became archbishop of Canterbury, a position he held from

1093 until his death; in England he is therefore known as Anselm of Canterbury.

Although Anselm acquired a reputation for sanctity during his lifetime, his lasting fame rests on a series of great theological works, including *Monologion*, *Proslogion*, and *Cur deus homo*. He was named a doctor of the church in 1720 and is often described as the most important Christian thinker between Augustine and Thomas Aquinas.

Ansprand

Ansprand (d. 712) overthrew the last member of the so-called Bavarian dynasty of Lombard kings, Aripert II (r. 701-712). Before that, Ansprand had been the guardian of the young king Liutpert, son of Cunincpert; but Liutpert had been overthrown by Raginpert, duke of Turin. Raginpert died shortly thereafter, leaving the throne to his son Aripert II. During the greater part of Aripert's rule, Ansprand was in exile in Bavaria, but in 712 he returned with a Bavarian army and secured recognition as king. Ansprand's reign lasted only a few months before he died; he was followed by his son Liutprand, who would be one of the greatest Lombard kings.

Antelami, Benedetto

Antelami (fl. 1178-c. 1230) was the third major Romanesque sculptor—after Wiligelmus and Nicholas—of the central Po valley; he was also an architect. Though he worked principally in Parma, his sculpture was very influential throughout northern Italy. He is known through two reliefs in Parma, which are signed Benedictus. His earliest securely attributed work, a relief of the Deposition (dated 1178) in the cathedral of Parma, bears the inscription *Anno Milleno Centeno Septuageno Octavo Sculptor Patuit Mense Secundo Antelami Dictis Fuit Hic Benedictus*. The lintel on the north door of the baptistery of Parma, begun in 1196, carries a similar inscription. The name Antelami suggests that he belonged to one of the guilds of civil builders, known as *Magistri Antelami*, of the Valle d'Intelvi on Lake Como.

The Deposition relief in the cathedral of Parma is now in the south transept, but it appears to have originally been part of a pulpit or some other liturgical furnishing. It has the principal traits of Antelami's style, notably a balanced composition focusing on a few vertically aligned figures separated by areas of flat background inlaid with niello. The figures have a solemn, austere, simple dignity, reminiscent of the work of Wiligelmus, combined with a greater degree of narrative complexity, surface detail, and ornament. Antelami also seems to have carved the episcopal throne in this cathedral c. 1180.

Antelami's major work is the architecture and sculptural decoration of the baptistery of Parma, largely executed between 1196 and 1216. This unified, coherent three-portal program with its systematic and comprehensive joining of architecture and sculpture was unique in Italy at the time. The north portal presents the Adoration of

the Magi on the tympanum and the story of the Baptist on the lintel, with prophets on the archivolts and the Tree of Jesse on the jambs. Inside, this tympanum depicts the Flight into Egypt. The iconographically inventive west portal links for the first time the Last Judgment, on the tympanum and lintel, with the Six Acts of Mercy and the Parable of the Laborers in the Vineyard, on the jambs. The south portal portrays the legend of Barlaam—an allegory of the transience of life. The Presentation in the Temple is on the inside tympanum. The iconographic program thus links salvation through Christ with the Old Testament (past), the Last Judgment (future), and allegories of human life and works. This ensemble introduced to northern Italy the use of complex iconographic programs that integrated representations of time and human activity into a complete cosmic and temporal scheme of salvation. A frieze with animal and floral motifs runs around the entire structure. Additional sculptures, including Labors of the Months and prophets, may have originally been created for a portal of the cathedral.

Another important work is a series of figures and reliefs from the central portal of the cathedral of Fidenza (formerly Borgo San Donino), executed c. 1185-1195. In this series, the freestanding prophets David and Ezekiel, in niches flanking the central portal, are most closely linked to Antelami. These solid, massive, dignified figures best reveal the plasticity of Antelami's sculpture.

Nothing is known about Antelami's training or his work before the Deposition in Parma. Certainly, some Roman influence is discernible in the solemnity, volume, and equilibrium of his compositions. However, a strong influence of French sculpture is also apparent. From his style and iconography, Antelami appears to have been familiar with both Chartres and the Romanesque sculptures of Provence, particularly Saint-Gilles-du Gard and Saint-Trophime in Aries; possibly, then, he made one or more journeys to France. This possibility is also suggested by Antelami's extensive use of the carved tympanum in Parma—a form common in France but seldom seen in Italy at this time. The complex iconographic scheme of the program for the baptistery in Parma may also reveal the influence of early Gothic portal programs in the ile-de-France.

Antelami or his workshop, or both, did carvings at San Andrea in Vercelli from 1219 to 1225. The central lunette of the Martyrdom of Saint Andrew is particularly close to his style. Antelami's workshop remained active and highly influential throughout the first half of the thirteenth century. Maestro dei Mesi, who carved the reliefs of the months on the Porta dei Mesi in the cathedral of Ferrara between 1225 and 1230, appears to have been trained in Parma by Antelami. Additional work by Antelami's followers includes the equestrian statue of Oldrado da Tressano in Milan (1233), the cathedral of Forlì, San Marco in Venice, and the work of Radovan in the cathedral of Trogir in Dalmatia.

Anthony of Padua, Saint

Saint Anthony of Padua (Fernando de Bulhoses, c. 1195-1231) was a Franciscan preacher and theologian. As one of the first generation of Franciscans, he helped determine the theological orientation of the order. He also achieved great fame as a preacher. After his death, his reputation as a miracle worker made him an extremely popular saint.

Anthony was a member of the lesser Portuguese nobility; he was educated at the cathedral school of Lisbon and entered the order of Augustinian canons regular at age fifteen. After two years at the monastery of Sao Vicente in Lisbon, he was transferred to the order's study house in Coimbra, where he received instruction in scripture and theology and was ordained a priest.

Devoted to an austere and studious life, Anthony was apparently disappointed by the level of religious observance in his order. Thus he was drawn to a group of Franciscans who frequently begged for food there; he found their emphasis on absolute poverty, mendicancy, popular preaching, and conversion of the Muslims closer to his concept of the apostolic life than what was becoming the more conventual monastic rule of his own order. When the relics of Franciscan

missionaries recently killed in North Africa were displayed in Coimbra, Anthony was seized with a desire to continue their work. He joined the Franciscan order soon afterward, at the friary of San Antonio, probably changing his name when he professed. He then set off for Morocco. But a serious illness halted his missionary journey just after he arrived in North Africa, and he was forced to return to Portugal. When a storm drove his ship to Sicily, Anthony decided to travel to Assisi in search of direction. After meeting Saint Francis and taking part in the order's general chapter of May 1221, he was sent to a hermitage near Forlì, where he spent a considerable period in contemplation and penance.

Anthony found a new focus for his Franciscan vocation by accident, when he was called to preach at an ordination. His learning and skill as a speaker astounded his hearers, and he was soon commissioned to preach against Cathar and Waldensian heretics in northern Italy. He preached in the north from 1222 to 1224, then in southern France in late 1224. From 1227 to 1231, he was back in northern Italy, keeping an exhausting schedule. By 1228, he had achieved sufficient fame to be asked to preach before the papal curia.

Anthony also served his order in other capacities. In 1223, Saint Francis himself seems to have commissioned Anthony to be the first Franciscan lector in theology. Over the next few years Anthony taught at Franciscan houses of study in Bologna, Aries, Montpellier, Toulouse, Le Puy-en-Velay, and Padua and introduced the theology of Saint Augustine to the order. In 1224, Anthony helped found Franciscan houses at Limoges and Brive in Aquitaine. In 1225, he was chosen as guardian of the house at Le Puy; then he was chosen as *custos* at Limoges; and in 1227, he was chosen as provincial of Lombardy and Emilia. He held the last post until 1230, when he asked to be relieved so that he could pursue his preaching without hindrance. At about this time Anthony's health began to fail, apparently as a result of his intense schedule. In 1231, he developed what was described as dropsy; he died in Arcello, outside Padua, on 13 June. FEven months later, on 30 May 1232, he was canonized.

Anthony's preaching made him a tremendously popular figure in Padua during the late 1220s. His sermons survive in four major collections: *Sermones in festivitatis sanctorum per anni circulum*, *Sermones per annum dominicales*, *Sermones in Psalmos*, and *Sermones*

in laudem et bonorem beatae Mariae Virginis. The published versions are rather academic, but it is likely that these sermons were much livelier when he preached them. Anthony's themes are typically Franciscan: he urges evangelical virtue, reception of the eucharist, devotion to Christ's humanity and to the Virgin Mary, civic harmony, and just treatment of the poor. There was a trend in Franciscan preaching toward vivid examples taken from popular stories and romances, but Anthony resisted this, preferring to drive home his message with constant references to scriptural texts and examples. He urged other Franciscans to use this conservative technique but had little success in persuading them. In two other areas, however, he influenced Franciscan preaching profoundly. The first Franciscan preachers had focused only on repentance and moral reform. Anthony and other educated men added a new emphasis when they began to instruct the faithful in dogma in order to combat heresy. In addition, Anthony's academic training led him to construct his sermons systematically and analytically. This approach was much admired and widely imitated.

Anthony's reputation during his lifetime rested on his preaching; his popularity after his death was based on his miracles. Wonders were reported at his tomb almost immediately after his burial. Belief in his

miraculous powers was reinforced by several biographies written shortly after his death, and later hagiographers continued to develop his fame as a miracle worker. His reputation for miracles led to his inclusion in the collection of Franciscan stories known as the *Fioretti* (*Little Flowers*). Eventually Anthony's popularity outstripped that of all the other Franciscan saints except, of course, Francis himself. Anthony came to be venerated as a patron of charity and marriage who cured fevers and diseases in animals, recovered lost articles, and protected lovers, women in labor, and miners.

Anthony was one of the best-educated of the early Franciscans, and so his authority as a theologian was quickly established in the order. After his death the order treated him as a doctor of the church, although he did not have that title officially until 1946, when it was granted by Pius XII. Anthony's theological views are fairly conventional for his time and training as an Augustinian canon; they derive from a biblical theology rooted in the church fathers, particularly Augustine. His scriptural exegesis focuses on the moral sense of the text, which he uses primarily to call his audience to moral reform and avoidance of heresy. Like many early Franciscans, he was very much interested in the humanity of Christ and in the theological role of Mary, and he was among the first to articulate a variety of characteristic Franciscan Christological and Mariological doctrines.

The main biographies of Anthony are *Legenda prima*, commonly called *Assidua*; and *Legenda secunda*, also called *Anonyma*. Both were written in the 1230s. Several other biographies were published during the thirteenth century, all based generally on the material in *Assidua* and *Anonyma*. At the end of the century another biography appeared that may contain some authentic material not included in the first two; this is known as *Benignitas*. The authorship of all three works is uncertain.

Antonello Da Caserta

Virtually nothing definite is known about the the life of the Neapolitan composer Antonello (fl. c. 1400). Apparently, he was born near Naples sometime in the late fourteenth century and lived into the early fifteenth. His name appears in five or six different forms, including Anthonello, Anthonelius, Marotus de Caserta, and Abbas de Caserta;

the last form suggests that he was an abbot.

Antonello is considered to belong to the third generation of Italian musicians of the *Trecento*, and specifically to have been one of a subgroup that responded to the bifurcated tastes of Italian patrons of the time, divided between French and Italian styles of the *ars nova*. Antonello's two styles are so distinct (and the surviving manuscripts of his works are so completely separated) that it has even been suggested there were actually two different composers of the same name. However, this duality may simply reflect his service to two culturally divergent courts, whose tastes related as much to their political orientation as to aesthetics. Thus his French compositions have been identified with the courts of the antipopes Alexander V and John XXIII at Pisa, where he would have been in contact with the francophile composer Matteo di Perugia; and it has been proposed that one of his Italian works was written on the occasion of one of the marriages (1415, 1423) of Queen Joanna II of Naples.

Eight of Antonello's Italian compositions (seven *ballate* and one double-texted madrigal) and eight French works (five *ballades*, two *rondeaux*, and one *virelai*) survive. Except for the madrigal, the Italian pieces are relatively simple in style, whereas the French works demonstrate the composer's mastery of the most intricate techniques, in the highly complex and "manneristic" French idiom known as *an subtilior*. Indeed, Antonello is one example of the Italian imitators who carried that French idiom to its extremes.

Antonio Beccari Da Ferrara

Antonio Beccari da Ferrara (1315–1371-1374) was a minor poet who produced about 150 works in the tradition of *poesia giocosa* (comic poetry). Antonio's father, Tura, was probably a butcher, as implied by the surname. His brother Nicolò, also a lesser poet, was a familiar of

Charles IV. Antonio may have received a humanistic education; certain stylistic elements and motifs in his poems suggest this.

Beccari led a disordered life, ruining himself with gambling despite the desire to reform expressed in his *Capitoli alia Vergine* (*Poems to the Virgin*, 1340). In 1343, he was banished from Bologna after wounding the *canterino* (minstrel) Jacopo di Salimbene in a fight. Antonio's vagabondage thereafter may have been necessitated by further such behavior. He sojourned with dynastic families: the Pepoli at Bologna, the Ordelauffi at Forlì, the Da Polenta at Ravenna, and the Da Carrara at Padova. He is also known to have lived in Modena, Venice, Florence, and Siena.

Beccari's poetic works consist mostly of sonnets but also include some twenty *canzoni*, sixteen *capitoli*, four *ballate*, and three *frottole*. Although his *canzoniere* may confound modern critics looking for a unified poetic "voice," the themes and content of his energetic poems are representative of his literary development; they also preserve glimpses of northern Italian court life, reflect contemporary political concerns, and express autobiographical and even moral sentiments. His Dantism is apparent: Beccari coined the term *padre Dante* ("father Dante"), and the lyric persona of one of his poems is so Dantesque that it was for a time attributed to Dante. Beccari knew or exchanged verses with Petrarch, Fazio degli Uberti, Cecco di Meletto de' Rossi, Gano da Colle, Antonio dalle Binde, Braccio Bracci, Lancillotto Angosciuoli, Antonio Pucci, and Menghino Mezzani. Franco Sacchetti remembers Beccari in his *Trecentonovelle*.

Antonio Da Tempo

Antonio da Tempo (c. 1275-c. 1336) was a judge and poet from Padua. He is best known as the author of *Summa artis rithmici vulgaris dictaminis* (1332), a treatise on vernacular poetry that was the most important work of its kind until the publication of Pietro Bembo's *Prose della volgar lingua* in 1525. Dante had written *De vulgari eloquentia* much earlier—in 1304 and 1306—but this treatise was not widely known to scholars and poets until its publication in the sixteenth century. Antonio does not acknowledge it, although he was probably familiar with Dante's *Commedia* (Andrews 1977, vii).

Antonio's *Summa* was enormously popular during the *Trecento* and in the following centuries. It was transmitted in many manuscripts, the most important of which are MS 4 (fourteenth-fifteenth centuries) of the Biblioteca del Seminario in Padua, MS. II 357 (fourteenth century) of the Biblioteca Comunale Ariostea of Ferrara, and MS 3436 (fourteenth century) of the Biblioteca Apostolica Vaticana. Antonio's tract in Latin was translated and popularized by the Veronese Gidino da Sommacampagna c. 1350 and by the Paduan Francesco Barattella in 1447. The *Summa* was first published in 1509 in Venice and was reissued

in 1869; a fine critical edition was published in 1977.

In the *proemium*, Antonio explains the subject matter and its importance. He then outlines seven poetic genres: (1) sonnet, (2) *ballata*, (3) *cantio externa* (*canzone distesa* in Italian), (4) *roton-dellus*, (5) madrigal, (6) *sirventes*, and (7) *motus confectus* (a genre that is metrically similar to the *frottola* but, unlike the *frottola*, deals with high-minded themes). Except for the *cantio externa*, which takes only one form, all these genres are polymorphous; Antonio describes, for instance, many types of sonnets. He follows his typological presentation with several short sections dealing with the dos and don'ts of writing poetry. For example, he explains the etiquette of receiving and sending poems. He reminds readers that when responding to a sonnet, a poet must use rhyme words that are different from those of his correspondent and may use the same words only if they have a different meaning. He then presents different types of subtle wordplay and rhyme used in poetry, including an illustration of the technique of *ligata composition* in which each word in a verse shares its final syllable with a word in the verse that immediately follows. As with all of Antonio's examples, the one mentioned here underscores the importance of the visual as well as the oral features of poetry.

Antonio Pucci

The Florentine poet Antonio Pucci (c. 1310-1388) is known for sonnets in the medieval Italian comic tradition; poems on historical events involving Florence; *cantari* on popular legends; and *Centiloquio*, a poetic transcription of Giovanni Villani's *Cronica* (*Chronicles*) in terza rima. The son of a bronze caster whose specialty was church bells, Pucci was appointed the official bell ringer of Florence in 1334. In 1349 he became the *banditore* (town crier), a position he held for the next twenty years. During his tenure as *banditore*, he had occasion to spread the news concerning many events of Florentine history, and some of them became subjects of his *serventesi*: the flood of the Arno in 1333, the famine of 1346, the plague of 1348, the victory of the Florentine militia over Padua in 1337, and the overthrow of Gualtieri di Brienne,

the duke of Athens, in 1343.

The great variety of themes found in Pucci's poetry gives the reader a broad picture of life in Florence during the mid-fourteenth century. In addition to historical events, Pucci delighted in portraying quotidian life: for example, an invective against a chicken vendor who sold the poet a desiccated old hen (*Andrea, tu mi vendesti per pollastra*), an ode to a sloppy barber (*Amico mio bar bier, quando tu meni*), and the poet's lament at being forced to churn out his art for inadequate compensation or none (*Deb fammi una canzon, fammi un sonetto*). Many sonnets are didactic, offering advice on how to be a good husband or wife (*Amico mio, da poi ch'hai tolto moglie* and *Figliuola mia, poi che se' maritata*), or how to raise children (*Quando 'I fanciul da piccolo scioccheggia* and *Il giovane che vuol avere onore*). *Temario sulle noie* lists numerous annoyances of daily life in the form of the traditional Provençal *enueg*, beloved of many medieval Italian comic poets.

Pucci was a great admirer of Dante. He wrote a sonnet (*Questi che veste di color sanguigno*) commemorating the portrait of Dante that Giotto painted in 1335; and in *Centiloquio*, Canto LV is dedicated to praise of Dante, a description of his works, and the story of his life. In *Libra di varie storie*, also known as *Zibaldone*, which Pucci intended for his private use, there are frequent citations from Dante's *Commedia*.

Another painting by Giotto, the allegory of the *comune rubato* ("robbed city"), was the probable model for two of Pucci's sonnets: *Ohmè, Comun, come conciar ti veggio*, a lament on the suffering of Florence due to bad government; and *Se nel mio ben ciascun fosse leak*, in which Florence, personified, addresses those who maltreat her.

One of Pucci's recurring themes is his defense and praise of women. In response to a misogynistic sonnet by Buto Giovannini, *Antonio mio, di femmina pavento*, Pucci wrote *La femmina fa l'uom viver contento*, extolling the virtues of feminine companionship and lamenting the abuse without provocation that many women receive at the hands of men. This theme is more amply developed in *Il contrasto delle donne*, a poem of seventy-five stanzas cast as a debate between an unnamed misogynist and a defender of women. Using *exempla* from the Bible and classical literature, each interlocutor presents a case, but the poem is structured so that the defender of women can refute all the arguments advanced by the detractor.

Exemplary women are the protagonists of three of Pucci's five *cantari* on popular legends: *Gismirante*, *Bruto di Brettagna*, *Madonna Leonessa*, *La reina d'Oriente*, and *Apollonio di Tiro*. Other *cantari* were written to commemorate political events; the seven *cantari* of *Guerra di Pisa* (*War with Pisa*) are examples. These short poems in *ottave*, written in a formulaic style, were composed for recital in the *piazze* of Florence. The virtuous behavior of the heroes and heroines of the *cantari* and other *canzoni* written by Pucci to illustrate a moral point are indicative of the didactic bent of much of his poetry.

Pucci enjoyed writing sonnets in the tradition of courtly love, adding a note of overt sensuality to an allusive but circumspect genre. *Corona del rnessaggio d'amore*, a cycle of nineteen sonnets depicting the ritual of courtship, concludes with a description of lovemaking. The *serventese* on the beauties of his lady, *Quella di cui t' son veracemente*, is also markedly sensual.

As a man whose work involved riding around Florence on horseback blowing a trumpet and making official proclamations, Pucci knew the streets of the city well. In *Ternario delleproprietà di Mercato Vecchio*, Pucci describes the colorful bustle of the market piazza at various seasons of the year, giving the reader a rich and vivid document of Florentine life in the poet's time.

Apostolic Brotherhood

The Apostolic Brotherhood, a religious sect also called Doicinities,

pseudoapostles, or *minimi*, was founded in Parma c. 1260 by Gerardo Segarelli, an uneducated laborer. Gerardo was apparently influenced by the apocalyptic speculations of Joachim of Fiore, whose disciples had predicted that the year 1260 would begin a new, more spiritual age in Christian history. To usher in this new age, Gerardo began going about as he imagined the apostles doing, living in poverty and preaching the gospel. He soon attracted followers who, like himself, tried to imitate Christ and the apostles, even in their dress: they wore tunics of rough white cloth with a cord cincture and had long hair and beards. They recognized no authority in their midst, took no vows, and felt bound only by the practice of poverty and the spirit of love. They did not pretend to offer a new message; they taught only the gospel. Women soon joined the sect and were also accepted as apostles.

The group operated for many years in and around Parma with no interference from the ecclesiastical authorities. The bishop of Parma treated them as eccentrics rather than heretics. Meanwhile, Gerardo seems to have been content to live as an equal among his followers, although he did use his influence to encourage missionaries to go to other parts of Italy, southern France, and Spain.

The growth of the brotherhood eventually drew the attention of the papacy, however; and in 1286, Pope Honorius IV ordered that all the Apostolic Brothers were to be rounded up and imprisoned. Four years later Pope Nicholas IV repeated the order, this time calling for inquisitorial intervention. In 1294, four important members of the sect were captured at Parma; shortly afterward they were tried by the inquisitorial tribunal and executed. Gerardo then submitted himself to the bishop's tribunal, recanted, and was sentenced to life imprisonment. The bishop commuted this sentence to perpetual house arrest in the episcopal palace. Meanwhile, the inquisitors continued their suppression of the brotherhood. In 1300, they called Gerardo before them on suspicion of having relapsed. He was found guilty and burned with several recalcitrants, although a number of his followers recanted and were given penances.

The reaction of many in the sect to this persecution is reflected in the views of Gerardo's successor, Dolcino di Novara. Dolcino propounded a radical form of Joachimism, branding all who opposed the sect ministers of Satan and declaring that the enemies of the brotherhood

might be killed because they were attacking the true church. Dolcino and a sizable band of followers remained at large for seven years, often hiding in the mountains. When they became increasingly violent, plundering the countryside from a stronghold in the Alps, Pope Clement V called a crusade against them. An army led by the bishop of Vercelli defeated Dolcino's force and captured him in early 1307. Three months later he was executed.

The death of Dolcino did not finish the Apostolic Brotherhood. The brotherhood seems to have survived well into the fourteenth century, and it was still of sufficient concern to be mentioned as a menace by the council of Narbonne in 1374. However, later identifications were sometimes a result of confusion with other groups, such as the Beghards and Beguines.

Aquileia

Aquileia was founded in 181 B.C. on the Via Postumia—the Roman highway centered on Cremona—and rapidly became an important Roman commercial and military center. According to tradition, Saint Mark established the first Christian bishopric at Aquileia, although the see really dates from the third century. By the fourth century, Aquileia had become the administrative capital of Venetia and Istria, and in the fifth century, it was designated a metropolitan see.

Bishop Macedonius of Aquileia ran afoul of Rome when he embraced the heretical Three Chapters and was condemned by Pope Vigilius in 554. Defiantly, Macedonius declared Aquileia independent of the Holy See and adopted the title "patriarch" to underscore his succession from Saint Mark and his equality with the successor of Saint Peter. But the greatest threat to Aquileia was not the pope in Rome. In 568, the Lombards swept into the region and conquered the city. Patriarch Paoiino I gathered his clergy and the faithful and fled to Aquileia's island port of Grado. There he and his successors remained in exile. In 607, a new patriarch, Candianus, restored the see to obedience to Rome; but in so doing, although he ended one schism, he started another. Refusing to accept submission to Rome, the bishops on the Lombard mainland elected their own patriarch, John.

As long as the patriarch of Aquileia remained schismatic, the pope and the emperor in Constantinople recognized the patriarch in Grado as the legitimate successor of the metropolitan see; but this changed in 696 when at last the patriarch in Aquileia returned to obedience to Rome. With no schism, there was therefore no longer a need for two patriarchs. Not surprisingly, neither metropolitan was willing to have his see dissolved. Pope Sergius I recognized both, dividing the old Aquileian jurisdiction between them

Relations between the patriarchs of Aquileia and Grado were never good. Each prelate considered his neighbor a usurper of his own rights and privileges. Because of its position on the mainland, the see of Aquileia was invariably controlled and enriched by mainland powers. In 770, the Lombards conquered Istria, allowing the patriarch to take control of the church there. At the synod of Mantua in 827, the pope formally recognized what was already fact, transferring jurisdiction over Istria to Aquileia. As a result, the patriarch of Grado became little more than the prelate of the Venetian lagoon.

During the first half of the eleventh century, Aquileia profited greatly from good relations between the papacy and the German empire. Patriarch Poppone of Treffer acquired extensive political privileges and lands from the German kings. It was he who built the beautiful Basilica Teodoriana in Aquileia. In the papal court he argued that the patriarchate of Grado was useless and redundant and should be dissolved. The patriarch of Grado was summoned to Rome to discuss the situation but did not come. Taking matters into his own hands, Poppone invaded Grado in 1024, capturing the cathedral and palace and presenting the new pope, John XIX, with a *fait accompli*. Soon afterward, the Venetians came to the aid of their prelate, forcing Poppone back to the mainland. At a synod in 1027, the pope and the German emperor Conrad II pronounced Poppone the metropolitan of both Aquileia and Grado, thus dissolving the latter see. But the Venetians stood ready to fight for their patriarch, so the decree could not be implemented. In 1044, the patriarchal dignity was officially restored to Grado.

During the ensuing struggle between the empire and the *papacy*, Aquileia was firmly in the German camp while the patriarchs of Grado were themselves active reformers. In 1053, Pope Leo IX declared Grado "New Aquileia" and transferred jurisdiction over Istria and the patriarchal title to the island see. The patriarchs of Aquileia ignored the papal constitutions, retaining their power until it was officially restored to them by Pope Innocent II in 1132. Istria, however, remained a bone of contention, particularly as Venice extended political control over the region.

The struggle between Aquileia and Grado continued throughout the Middle Ages, with neither side willing to give ground. Aquileia

remained a feudal principality until the Venetians conquered Friuli in 1420. Even then the patriarch refused to acknowledge the conquest for twenty-five years. In 1445, he accepted a treaty that reduced his possessions to the city of Aquileia, San Vito, and San Daniele del Friuli. Henceforth, all patriarchs of Aquileia were Venetian. The patriarchate was suppressed in 1751.

Aquileia, Rite of

The northern Italian city of Aquileia became a patriarchate in the sixth century. Though there has been speculation about an independent liturgical rite being celebrated there, and even a repertoire of Old Aquileian chant, the surviving evidence is very scanty. There are some details in early liturgical sources that suggest distinct practices: the Sanctus is not yet found among eucharistic prayers, and Patriarch Paulinus is mentioned in the Canon. Some Aquileian sacramentaries are distinguished from other mixed Gelasian books in the preface of the mass and the use of certain prayers from the Gregorian missal. An

anonymous seventh-century source mentions the fourth-century Aquileian bishop Cromatius in relation to the origins of chant, and an eleventh-century musical source contains a pre-Carolingian baptismal rite with melodies that are notably simpler than settings of the same texts found in Gregorian and Ambrosian sources. A twelfth-century trope survives that gives evidence of local composition, and liturgical drama was quite popular. These elements may suggest unique liturgical practices and a unique musical repertoire, but so little survives that we cannot speak with certainty on the exact nature of an early independent rite or its accompanying liturgy and music. Many fourteenth- and fifteenth-century plenary missals survive—such as the *Missale pro S. Aquileiensis ecclesiae ritu*, which appeared in 1494, 1517, and 1519—but the differences they contain in comparison with other rites are limited. Following the Council of Trent, the Roman missal of Pope Paul V was put into use, and the patriarchate rite was abolished in 1594-1595.

Arabic Literature in Italy

Between the ninth century and the eleventh, Sicily was occupied and ruled by Muslims. During the first phase of this period, Muslim Sicily—in Arabic, *Siqilliyya*—suffered from the sort of upheavals that characterize newly colonized regions, and the unrest there was compounded by dynastic tensions and transitions elsewhere in the Arab world. The relative peace and prosperity that followed this first century as a Muslim state—roughly, from the mid-tenth century until the mid-eleventh—was shattered by the arrival of Norman conquerors. The Normans' first military activity on the island occurred in 1038, and they finally took Palermo, the chief city of Muslim Sicily, in 1072. The Normans' rule of the island (along with the southern part of the Italian mainland) ended with the death of the last Norman king of Sicily, William III, in 1194. Throughout the Norman era, Arabic culture remained a dominant presence in the kingdom of Sicily.

Because of the unrest that characterized the early years of Muslim rule in Sicily, the cultural life of the state did not come into its own until roughly the time of the Norman conquest. The great medieval anthology of Sicilian poets, collected by Ibn al-Qatta' (1041-1121), has been lost. But an Andalusian, 'Imad al-Din (1125-1201), included the works of some Siculo-Arab poets of the eleventh and twelfth centuries in his anthology of the poetry of his age. For these reasons, the Arabic literature written in and about Sicily during the Norman era has attracted more scholarly attention than the sparse literature preserved from the early years of Muslim *Siqilliyya*. The Arabic literature of Norman Sicily—which includes poetry written both to praise and to condemn the Norman conquerors of Sicily, travelers' accounts of Sicily, and a small number of scientific and philosophical works—provides a remarkable portrait of a state under Christian rule but still to a large extent culturally Arabic.

Ibn Jubayr, an Andalusian who wrote a record of his travels while on pilgrimage, left a succinct and eloquent account of the cultural tension during the years of Norman domination. In 1184, on his return from Mecca, Ibn Jubayr was shipwrecked in Sicily. He tells us that the Sicilian monarch, William II, came to the dock to welcome the travelers and personally paid the landing fee for the Muslims on Ibn Jubayr's ship. Ibn Jubayr considers William's admiration of Muslim learning, like the island's famous volcano, Etna, to be one of the wonders of

Sicily. William speaks Arabic; he has an *'alama* (an Arabic honorific title used in numismatic and architectural inscriptions and in the heading of official documents); he retains Muslim physicians and astrologers. But Ibn Jubayr also illustrates through interviews and anecdotes the daily lives of Muslim Sicilians, who endure increasingly severe economic and religious restrictions. During Ibn Jubayr's visit, Palermo was rocked by an earthquake. Ibn Jubayr tells us that the palace rang with the cries of William's servants—many of whom had converted to Christianity as a condition of employment—calling on Allah, in the moment of crisis, to save them. William, unperturbed, was reported to have said: "Let each of you call upon the God to whom you are subject; let that give you peace."

The Norman monarchs—in particular Roger II, king of Sicily from 1095 until 1154—encouraged the composition of panegyric poetry in their honor. One poet, known as al-Atrabanishi (the name means "from Trapani"), wrote a panegyric for Roger celebrating the royal fishing preserve, Favara. "O Favara!" the poet sings, "in you, desires converge! ... It is as if your waters, where they flow together, in their clarity were melted pearls, and the land were dusky skin." Because of its beauty and elegance, this has become the most famous of the Arabic poems of Sicily. Gabrieli (1980) called it "practically the symbol of Muslim Sicily," despite the fact that it was a product of a Sicily under Norman, not Muslim, rule. 'Imad al-Din's anthology preserves a number of other panegyrics written for the Norman monarchs. Al-Buthayri ("from Butera"), for instance, celebrated the Norman line as a "dynasty that rivals the empires of the Caesars." Another poet, Abu Hafs, was imprisoned by Roger and wrote an impassioned poem celebrating the monarch in the hope of winning his release.

Most of the Arabic poetry of the Norman era, however, denounces the Norman conquerors. (The most notable exception is al-Balianubi—"from Villanova"—who left Sicily after the Norman conquest but did not use anti-Norman invective as a poetic theme.) Abu al-'Arab (1032-1112 or 1113), much celebrated for his eloquence, wrote contemptuous verses accusing his homeland of betrayal for having fallen to the Normans. So did 'Abd al-Halim, who drew an implicit comparison between Muslim Sicily's capitulation to the Normans and Adam's fall: "Ardently did I love Sicily as a young man, and it was like

a corner of the garden of eternity; but it was not ordained that I should live to middle age before it became a burning hell." Abu Musa produced a bitter denunciation of the Normans. He also left a number of tender poems celebrating his love for a "blond girl," who may herself have been a Norman. This interpretation is supported by one of the more enigmatic verses in the poet's anti-Norman invective: "Is it beautiful to forsake one who has affection for you? And is it lawful, in the Messiah's faith?" The anti-Norman poems illustrate the upheavals and the tension that followed the Normans' arrival and serve as testaments to the attachment that Muslim Sicilians felt to their homeland before its loss.

Arab Sicilians and Arab visitors to the Sicilian court also produced important non-poetic literary works. Ibn al-Qatta', who compiled the lost anthology of Sicilian poets, wrote a history of Sicily, which has also been lost. Al-Idrisi (1100-1166) was born in Ceuta, in present-day Morocco. It was at Roger's court, however, that he wrote his great geography, one of the most ambitious and accurate treatises of the Middle Ages: *Kitab al-Rujjar* (*Book of Roger*). Al-Idrisi interviewed travelers arriving in Sicily for information concerning the lands they had visited. On the basis of these interviews, a globe was constructed from precious metals, and Al-Idrisi wrote his geography as an accompanying gloss for the globe. According to some sources, the prominent writer Ibn Zafar (1104-1171) was born in Sicily. He was raised in Mecca, however, and returned to Sicily only as an adult. Some scholars believe that he was living in Sicily when he wrote his "mirror for princes," *Sulwan al-Muta'*. The text was well known and had a wide circulation in the Arab world.

Sicily's most prominent Arab writer, and one of the greatest Arab poets of the Middle Ages, was Ibn Hamdis (1056-1133). Ibn Hamdis was born in Sicily, after the Norman invasions of the island had begun. He was sixteen years old when the Normans took Palermo. Six years later he left, and he spent the rest of his life in al-Andalus (Andalusia) and North Africa. His magnificent poems about Sicily, known as the *siqilliyyat*, are imbued with the exile's tender nostalgia and bitterness. One of the most haunting of these begins with a description of an idyllic scene from the poet's youth in Sicily: a bacchanalian party at a convent, where Ibn Hamdis and his friends obtained wine from the

nuns and entertained each other with music through the night. As the poem draws to a close, the poet turns to the theme of memory, contrasting his recollections of the lost delights of his homeland with his suffering in exile. "I remember Sicily," he writes, "and sorrow is aroused in my soul by the memory." The poem's rhyme scheme requires that each line end with a feminine possessive pronoun. The pronoun may refer to any feminine noun (and also to plural masculine nouns), but in Ibn Hamdis's poem its most frequent referent is Sicily. This knell at the close of each line dramatizes the exiled poet's obsessive memories of his lost homeland.

The Arab writers of the Norman age represent, ironically, the culmination of Arabic literature in Sicily. Frederick II, son of a Norman mother and the Hohenstaufen king Henry VI, was king of Sicily from 1197 until 1250. He maintained significant contacts with Arab rulers and cultural figures outside Sicily, and translations of Arabic philosophical and scientific texts were made during his reign (including a translation of Maimonides's *Guide for the Perplexed*, which has been lost). But Frederick's treatment of the Muslims in his own kingdom contrasted sharply with his enthusiasm for Arabic culture. He transferred the Muslims remaining in Sicily to a ghetto city on the Italian mainland, Lucera (in present-day Puglia, or Apulia). By the beginning of the thirteenth century, Arabic ceased to function as a language of culture in the kingdom of Sicily. Some scholars have argued that Sicily's Arabic literary tradition influenced the poets of the *scuola siciliana*, who wrote during Frederick's reign. Although no convincing evidence to support this supposition has appeared, the remarkably swift transition between Arabic and Romance literary traditions in Sicily remains one of the most striking, and least understood, chapters in medieval literary history.

Arabs in Italy

For roughly three centuries—the ninth, tenth, and eleventh—the Arabs played a major role in Italian history. During most of that period, they held Sicily and even penetrated the Italian mainland. After Sicily fell to the Normans, however, Arabs were no longer seen as dominant or threatening, and the character of the interrelationship changed. Norman Sicily continued to have a large Arab population; thus Arab influence was noticeable there in architecture as well as in the Norman court and its cultural interests. Later, in the thirteenth and fourteenth centuries,

one can detect even in mainland Italy some elements of Arab influence—for example, in literary forms and in science. Also, trade with the Arab world persisted; Genoa offers a prime example. But by then the Arabs who had invaded Italy were only a remote memory.

Therefore, we must concentrate here on the first phase, primarily the ninth through the eleventh centuries. It had begun gradually, with intermittent raids on Byzantine-held Sicily not long after Egypt and then most of North Africa had surrendered to Arab armies. (Alexandria was taken in 642, and by 670 the Arabs' power was solidifying in what is now Tunisia.) In the early eighth century, most of Spain was also taken, Italy's vulnerability increased, and there were more reports of raids and piracy. But the true dimensions of the threat did not become apparent until the ninth century, when the situation became much more complex.

Mahomet (Muhammad). Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 151v.

The first dramatic development was the Arab conquest of Sicily,

which began in 827. The western half of the island, including Palermo, was quickly taken, and then much of the northeast; Messina fell in 842. It is true that the entire island did not come under Arab control until the turn of the tenth century. (Beleaguered Syracuse, the Byzantine capital of Sicily, had held out until 878, and a few lesser outposts even longer.) But as early as 831, when Palermo was declared the new Arab capital, the implications for mainland Italy seemed clear. There would surely now be more raids on the mainland, and other contacts were also more likely. There is evidence that trading had never entirely ceased between southern Italy and what were now Muslim territories; with Sicily in Arab hands, the potential for this commerce would be enhanced. More immediately, however, there was a different development: in the mid-830s, local southern Italian rulers started hiring bands of Arab mercenaries, mainly from Sicily.

Naples, under continual attack from the southern Lombards based at Benevento and Salerno, was the first city to bring in such mercenaries. Less than five years later, both Benevento and Salerno (by then at war with each other) did the same. From that point on, through the rest of the ninth century and into the early tenth century, southern Italy knew Arabs in several roles. Some were imported as mercenaries and then stayed on as freebooters, operating from bases scattered throughout the lower peninsula and marauding as far north as the duchy of Spoleto and Farfa. Others came uninvited, including one group which seized the important port of Bari on the Adriatic and created there a minor emirate that lasted from 847 to 871. Actually, many of these invaders, like many of the presumably Arab conquerors of Sicily, were probably Berber; the North African Berbers had been converted to Islam after being conquered by the Arabs. But to the victims of their raids—such as those who were seized and carried off for the slave trade—this ethnic differentiation hardly mattered. Nor did it matter to the important monasteries of southern Italy; for them, the crucial issue was the continual menace represented by all the interlopers. Both Monte Cassino and San Vincenzo al Volturno were raided again and again, and, in the early 880s, both had to be abandoned; they remained abandoned for several decades.

In marked contrast, successive dukes of Naples, the Lombard rulers of Benevento and Salerno, and port towns such as Gaeta and Amalfi

seem to have remained, for the most part, on excellent terms with these "infidels." There were reasons for this. During most of the ninth century, Byzantium, which claimed a significant portion of southern Italy, was in no position to intervene there; and the Carolingians, mostly preoccupied with matters far to the north, appeared equally disinterested. So it was perhaps inevitable that, for example, Naples in the second half of the ninth century became known as a "second Palermo": the streets of the city were full of Arab visitors, and even the powerful bishop of Naples committed himself to a connection with the Arabs. To southern Italian leaders concerned with survival, it must have seemed that the region's future lay with the Muslim world.

There were, nonetheless, a few notable interventions. In 846 a combined Sicilian and North African force had dared to attack Rome (and had carried away an array of treasures from Saint Peter's and other churches). In response, the emperor Lothar dispatched to southern Italy an army led by his son, the future emperor Louis II. Although the raiders who attacked Rome had come directly from overseas, Lothar plainly saw southern Italy as the root of the problem. In due course, Louis cleared away some of the Arabs, partly by forcing a settlement of the southern Lombards' civil war. About twenty-five years later, in 871, Louis finally managed to take Bari, dislodging the Arab emirate that had stood as the most glaring example of the Muslims' dominance. After Louis's death, however, Pope John VIII found Naples, Salerno, Gaeta, and Amalfi still intransigent; neither large bribes nor excommunication could persuade them to break their links to the Arabs. Even a fierce Arab attack on the city of Salerno, mounted by the North African emir in the 870s with the clear intention of conquest, had dampened their enthusiasm only temporarily.

By the turn of the century, however, we find a change, for which two developments were primarily responsible. First, in the 880s, the Byzantine emperor had moved to restore Byzantium's image and power in the Italian peninsula—no doubt also hoping to retake Sicily eventually. Armies were dispatched, and the Lombards, who had been dominant throughout most of southern Italy for centuries, were stripped of much of Apulia and Calabria. This altered the balance of power in the south, but it also suggested new possibilities to the rulers of the minor Lombard states; Byzantium could provide a counterfoil to

the Arab thrust. In 902, something happened that made this possibility seem eminently desirable: an implacable North African emir, Ibrahim, who terrified not only Christians but even his fellow Muslims, led the fiercest Arab attack ever against southern Italy. Although Ibrahim died suddenly in Calabria before he could fully achieve his goals, his campaign caused southern Italians to reconsider their tolerance of the Arabs in their midst. At that time, the most rapacious Arab enclave was situated along the Garigliano River, near Gaeta. It constituted a threat not only to Rome but also to Lombard Capua, and so the Capuans, after failing to dislodge the Garigliano Arabs with the help of some Neapolitans and Amalfitans, sought help from Constantinople. In 915, a combined army of Byzantine and Lombard southern Italians, supplemented by northern and papal forces and with a Byzantine fleet standing offshore, swept the Garigliano region clean.

General histories of medieval Europe often portray the action in Garigliano as signifying the end of the Arabs' presence in mainland Italy, but this was not the case. Although Campania seems to have been little troubled thereafter, Genoa was raided in 934 and again in 935, and Pisa was raided as late as 1004. Moreover, Byzantine southern Italy—Apulia and Calabria—continued for a long time to be plagued by Arab raiders. Important towns there were devastated, and in the mid-tenth century Byzantium, its hold significantly weakened, was forced to condone widespread payments of tribute to the Arabs and to accept the building of a mosque at Reggio Calabria. The situation eased somewhat in the later tenth century, when there were power struggles among the Arabs. Nonetheless, in the first half of the eleventh century Calabria still suffered sporadic attacks.

In one respect, however, the year 915 and the Garighano campaign did indeed mark a watershed. With Arab raiders gone from their immediate area, the independent minor states of southern Italy began to strengthen their economic relationship with the Arab world. By then the political situation in Campania (the core area of these small independent states) was stable; there was no further need for Arab mercenaries. Instead, we find increased prosperity and agricultural activity, and the widespread use of a Sicilian and North African coinage, the *tari*. Locally, the carrying trade with the Arab world was dominated by the city-state of Amalfi; there are reports of Amalfitans

throughout the Arab Mediterranean, from Palestine to Spain, during the tenth and eleventh centuries. But Amalfi was plainly not alone in benefiting from this trade; almost everywhere in Campania, in charters from this period, *tari* are cited as the medium of exchange.

It was surely no coincidence that this period was the golden age of Arab Sicily. The conquest of the island had taken up most of the ninth century, and in the late eleventh century the Sicilian Arabs would dissolve into factionalism, making it easier for the Normans to take over. But in the tenth century and the early eleventh, Sicily was more or less stable and well-governed. Simultaneously, moreover, the Fatimid region in North Africa was thriving, and in 969 its ruler assumed control of Egypt as well. Sicily and North Africa were relatively near Campania, and Amalfi seems to have enjoyed particularly good relations with the Fatimids.

In the early eleventh century, Byzantium gave more attention to southern Italy, putting new pressures on the southern Lombard principalities. At the same time, a number of Normans appeared on the scene, in essence assuming the role once taken by Arab mercenaries. During the resulting disorder and conflict (which involved the papacy as well), we hear little about Arabs until a move by the Normans against Sicily in the second half of the century. Yet Campania (particularly Amalfi and Salerno) had obviously maintained strong links with the Arab world; and, notably, Constantinus Africanus, the Arab who in the latter eleventh century played such an important role in medical teaching at Salerno, was said to have come there initially as a merchant.

Constantinus Africanus is the first example of an Arab conveying Arab high culture to mainland Italy. The marauding bands of the ninth century left no trace except destruction (and, in reaction, increased fortification). The Bari emirate, essentially the creation of dissident adventurers, also left no lasting mark. Even the nearness of Arab Sicily had not resulted in any major cultural transmission. Not until the Norman twelfth century did that situation change; only in the period of Roger II does one begin to encounter translations from Arabic scientific works, an appreciation of Siculo-Arab poetry, and a conscious adoption of an Islamic aesthetic in building and decoration. Earlier, the most one can say is that trade with the Arabs brought into Italy material objects

from the Islamic world. In treasuries throughout Italy, one can still find examples of tenth- and eleventh-century Islamic glass and metalwork, and we know that textiles also came in. Presumably this explains why, here and there in southern Italy, one finds Islamic motifs incorporated into some buildings of this period.

Otherwise, however, the first three centuries of interaction with the Arab world seemingly had little impact on the culture of mainland Italy. There was an economic impact—positive for Campania, largely negative for the regions held by Byzantium— but nothing broader. Perhaps the reason, in part, was that Sicily, the nearest Arab territory, bore little resemblance to Muslim Spain. We do find some mention of Arab Sicily, especially its poets, in Arab sources. Overall, however, Sicily was scarcely a center of high culture, and its rulers were very minor figures in the Islamic world. Even those Arabs who figured prominently in the court of Roger II, or during the time of Frederick II, were often not native Sicilians.

If Italy in the thirteenth and fourteenth centuries showed some fondness for Islamic motifs and forms, one must attribute it not to "Arabs in Italy" but rather to influences from Norman Sicily, Frederick II, and miscellaneous Arab contacts during and after the period of the Crusades. The last colony of Arabs in mainland Italy was an unfortunate group of Sicilian Arabs settled by Frederick II in and around his fortified castle of Lucera in the 1220s; evidently, they had been brought there as involuntary exiles after rebellions by the Arab population in Sicily. On two occasions, some of these Arabs around Lucera served Frederick as an elite fighting corps—once again, then, they might be described as imported Arab mercenaries—but for the most part the colony, numbering in the thousands, was simply settled on agricultural lands around Lucera. For a time, this transplantation appeared successful. However, after Frederick's death and the imposition of Angevin rule, the descendants of the original colony had no protectors. They were resented by those who coveted their lands and were preached against as infidels and idolaters. Most of them were massacred in 1300, and like their ninth-century predecessors on the mainland of Italy, these Arabs left no trace,

Arduin of Ivrea

Arduin (d. 1015) was marquess of Ivrea, in the Piedmont. During the reign of the German Roman emperor Otto III, Arduin became embroiled in a land dispute with Bishop Peter of Vercelli, and in 997 Arduin and his followers killed the bishop and burned his cathedral. For this act, Arduin's lands were confiscated and he was condemned to a life of penitent wandering. However, Otto III died without heirs in 1002. His death gave Arduin—who was a relative of Berengar II of Italy (950-961)—a chance to secure election as king of Italy, during an interregnum before the German princes elected Henry of Bavaria as king of Germany and future Roman Emperor,

From 1004 on, Arduin was challenged on a number of occasions by Henry II, but he held out in his homelands in northwestern Italy until 1014. Then, worn out by the constant conflict, Arduin retired to a monastery, where he died the next year.

Arezzo

During the reign of the emperor Augustus, Arezzo had a primary role in Etruria (region VII); but by the fourth century after Christ the city was in a period of economic and political decline. There are few literary or archaeological sources for this period. Undoubtedly, Christianity spread rapidly in and around Arezzo, aided primarily by a good network of roads in the region, even though the Via Cassia was relocated almost 20 kilometers west of the city in a.d. 123. As the new religion became widespread, Arezzo came to comprise a vast diocese—the most extensive in Tuscany before 1325.

During no era did political and religious jurisdictions coincide. In the east at the higher elevations of the Tiber Valley, for example, the *comitatus* of Arezzo included part of the diocese of Citta di Castello; but to the southwest the diocese of Arezzo included a huge territory that was politically dominated by Siena. In all four Aretine valleys—Casentino, Valdarno Superiore, Valdichiana, and Valtiberina—there are clear traces of the ethnic presence and dominance of the Ostrogoths between 480 and 553, and these traces are most evident in the toponymy.

As early as this period, urban growth—from the southern slopes (250 meters above sea level) to which it had extended in the late Etruscan era of the third century B.C.—was restricted to the summit of the hill (300-310 meters); it would spread from there to the south and west in the eleventh century. On the small rise of Pionta, 1 kilometer southwest of the city wall (of which little remains), there is archaeological evidence of an important early Christian necropolis, with epigraphs dating from 407 and 408. A later necropolis was built on this site in the sixth and seventh centuries. Sometime before 840, on the same site, the cathedral of Santa Maria and Santo Stefano was built over the

necropolis, which then became, after numerous alterations and annexations, the fortified citadel of the bishop until 1203. A document of the emperor Charles the Bald dating from 876 mentions that on the summit of the hill around the forum were a public granary; an already abandoned church, San Benedetto; and another church, San Pietro. Via Maior—the main road (as the name implies) and part of the ancient Roman *cardo*—rises from the midpoint of the slope to its summit. This road corresponds to the present-day Via Pellicceria and Via delle Gagliarde. Other streets identified on the rectangular Etruscan-Roman town plan (e.g., the present Corso Italia and Via Cesalpino) survive as roadways outside the city wall.

Arezzo was completely occupied by the Longobards in all likelihood by 599, following a peace treaty between their king, Agilulf, and the Byzantine exarch. Although never a part of the Longobard duchy, Arezzo remained adjacent to it for several centuries. For this reason and also because the Valdichiana—the most fertile of the Aretine valleys—was marshy, the route through Siena became the principal one between northern Italy and Rome in the interior of the peninsula sometime during the eighth century. Although archival records are lacking,

indirect evidence suggests a significant expansion of Longobard influence over the Aretine territory. There are records, however, attesting to the fact that its bishops were of Latin descent, at least until the second half of the eighth century, and to the existence of a cathedral school; both factors demonstrate the persistence of a limited Roman culture between the end of the seventh century and the beginning of the eighth. Numerous tenth-century parchments bear witness to a vibrant civic and cultural rebirth in the area, which was controlled by a bishop loyal to the emperor. Among the achievements of this period were the reconstruction of the Duomo between the tenth century and the early years of the eleventh century; the consecration in 1032 of the magnificent Byzantine temple of San Donato, the fourth-century bishop and evangelist who was presumably martyred and who later became the patron saint of the diocese; and important innovations in musical notation developed by the monk Guido. A close relationship between the Aretine bishopric and the imperial Germanic authority is indicated by the presence of emperors in Arezzo for centuries: from Charlemagne to Otto I, Henry IV, Henry V (who in 1111 destroyed the urban center and its encircling towered walls), and others. Despite the power of the bishops, the city on the hill developed as a free commune, and consuls are mentioned as early as 1098. Noblemen of barbarian and feudal descent also wielded great power, bolstered by their castles in the surrounding countryside.

In 1038, the records mention an immense *Platea Civitatis* outside the city walls built in the High Middle Ages; this is the site of the present, smaller Piazza Grande. The *Platea Civitatis* was constructed next to the apse of the Pieve of Santa Maria, the mother church and baptistery; Santa Maria as we see it today was rebuilt during the twelfth, thirteenth, and fourteenth centuries in the typical grand style, as a people's church in contrast to the cathedral of the bishop. As early as the eleventh century, residential areas were developing outside the gates of the city walls, which were only about 1500 meters long. The first such areas were Santa Maria, to the south along the modern-day Corso Italia on the way to Rome; and Sant'Angelo, to the northeast on the road to Rimini and the Adriatic. Also in the eleventh century, a group of churches (some with hospices) are documented on the connecting roads outside the walls: Santa Croce, San Giustino, San

Michele, Sant'Adriano, San Pier Piccolo, Santa Maria in Gradi, San Clemente, and Sant'Angelo in Arcaltis. Some of these churches had certainly been in existence for centuries. In the thirteenth century, Arezzo reached its greatest importance, as is evident from the founding of the university in the first decades of the century and from the construction of the monumental public palaces overlooking the Platea Civitatis; these palaces are situated on the hill near the present-day cathedral, which was begun in 1277.

Aretine architecture is characterized by simple forms and little ornamentation—an austere style that is accentuated by the local gray sandstone. Most of the medieval monuments were destroyed during the sixteenth century, when Arezzo was dominated by Florence: Pionta, the bishop's seat, was razed, as were churches and aristocratic buildings along the highest part of the hill and notable monuments in other parts of the city. Recent discoveries reveal the existence of Aretine schools of painting and miniatures dating from the thirteenth and fourteenth centuries.

The Aretiries were the first to write in the Tuscan vernacular, which would become the Italian language. Their writers included Fra' Guittone d'Arezzo, the leader of a school of poetry; and Ristoro d'Arezzo, who wrote *La composizione del mondo* (1282), the first scientific work in the vernacular. This period coincides with the rule of the Ghibelline bishop and warrior Guglielmino (1248-1289) of the feudal family Ubertini.

Petrarch (Francesco Petrarca) was born in Arezzo in 1304; it was the native city of his father, ser Petracco, who had returned there from Florence as an exile. Recent archival findings show that ser Petracco worked in Arezzo as notary to Bishop Guglielmino.

Arezzo was defeated by the Florentine Guelfs at the battle of the Campaldino (1289), and this defeat contributed to a decline that had already been set in motion by geographic, economic, social, and ideological changes. The factors causing Arezzo's decline worked in favor of Florence, which flourished rapidly and developed new concepts of culture and civilization.

Under the rule of Bishop Guido Tarlati (1312-1327)—who, against the pope's wishes, crowned Ludwig the Bavarian emperor in Milan in 1327—Arezzo experienced a brief political resurgence and an energetic

military and territorial expansion. At this time the largest of its many successive city walls were built; they measured more than 5 kilometers around. Even during this period, the population never reached 20,000; nevertheless, Arezzo had a thriving economy that included the production of woolen goods (until the eleventh century) and other commercial operations, such as long-distance trading, owing to its favorable location. The territory was densely populated and intensively cultivated and had hundreds of villages, some at elevations as high as 800 to 1000 meters above sea level. Because of these high altitudes and the unique features of the soil, the agricultural economy could be supplemented by forestry and herding.

After alternating phases of long, bloody battles with external enemies and between internal factions, the city became progressively impoverished and, finally, devastated. In 1384, it fell into the hands of the French *condottiero* Enguerrand de Coucy; he sold it to the Florentine republic, which was in a position to become a regional state.

Arian Heresy

When the emperor Constantine I supported Christianity, he expected Christians to be a unified body, but he discovered that they were divided over the question of the relationship between God the father and Christ the son. In spite of Constantine's efforts to resolve the

dispute quickly, the controversy affected churchmen and politicians throughout most of the fourth century. Orthodoxy was not fully victorious until the sixth century.

The controversy began in Alexandria c. a.d. 318, when Arius, a popular priest, reflected on the relationship between God and his son. Arius believed in the absolute singleness of the godhead, which he defined as the father. He then argued that if there was originally only one God, Jesus must have been created. Therefore, Jesus, although superior to every other creature, was subordinate—not equal—to God the father. Furthermore, Arius claimed that as a creature, Christ was not eternal.

It did not take long for Arius's views to be opposed. Arius's superior, Bishop Alexander, called a synod in 320, condemned Arius's ideas, and articulated the position that Christ was eternal and eternally God. The bishops at this synod believed that only by the incarnation of the true God could human flesh be fully redeemed, and the crucifixion of a created being would not have accomplished such salvation. Athanasius, Alexander's successor to the see of Alexandria in 328, took up the struggle against the Arians. Athanasius's writings on the subject, such as *Discourse against the Avians* (350), did much to establish the church doctrine of the Trinity.

By the time Constantine became the sole emperor in 324, both sides in the dispute had found many supporters. To try to resolve the issue, Constantine presided over the first ecumenical council, the Council of Nicaea, in 325. This council developed a creed that supported the bishop of Alexandria and explicitly denied the Arian position. But Constantine's hope of resolving the theological issue by imperial fiat was unrealistic: Christians who believed that their salvation depended on a correct understanding of the relationship among the members of the Trinity did not easily give up the struggle.

Churchmen trying to find an acceptable understanding of the Trinity held many councils during the next decades. They proposed various formulas to solve the debate, and passions raged about the subtle meanings of disputed Greek words. Was Jesus of the same substance (*homoousia*) as the father, or of like substance (*homoiousia*)? Was Jesus exactly like (*homoios*) or—as the most radical Arians claimed—unlike (*anomoios*) the father? Only when churchmen finally agreed that there

could be various interpretations of each word would they be able to form a coalition including all but the most radical Arians. However, imperial politics further complicated the theological discussions.

Just as Constantine had involved himself in the dispute, creating a connection between politics and theology, subsequent emperors were also drawn in. Constantine's son, Constantius, emperor of the east, supported the Arian cause, and the Arians strengthened their position at several church councils under his rule. Julian the Apostate, during his brief reign (361-363), withdrew imperial support from the Arians and permitted the Nicenes to reassert themselves. Emperor Valens (364-379) again strengthened the Arian cause, but Emperor Theodosius (379-395) finally ensured victory for the Nicenes among the Romans. In 380, Theodosius ordered everyone to adhere to the Nicene position, and he replaced all Arian bishops with Nicenes.

The Council of Constantinople in 381 drafted a creed restating the formula that the Council of Nicaea had developed fifty six years earlier; all forms of Arianism and semi-Arianism were condemned. The orthodox position was that Christ was "begotten from the Father before all ages . . . begotten, not made, of one substance with the Father." Throughout the Middle Ages, and later, this was known as the Nicene Creed. A few months after the Council of Nicaea, Ambrose of Milan presided over a council of western bishops that also condemned Arianism.

By the late fourth century, then, Arianism was no longer a real issue among Roman Christians. However, it continued to appeal to Goths. In 341, during a period of Arian ascendancy, the Goth Ulfilas had been ordained a bishop. Ulfilas supported the Arian position, and his missionary work among the Goths served to make Arianism almost a Gothic religion. The Vandals, Visigoths, Burgundians, and Lombards who invaded the empire were all Arians, and their beliefs prevented them from assimilating readily with Roman Christians. Religious differences may have been a factor in the establishment of independent German kingdoms from the weakened empire.

Nevertheless, the majority—the Nicene Christians—eventually predominated. In the sixth century, all the Germanic Arians finally converted to the orthodox view. After centuries of dispute about the nature of the Trinity, Christendom was united under the difficult and

mysterious concept of three persons (*hypostases*) who were one God, of one substance, eternally uncreated.

Aribert

The Italian prelate Aribert (Ariberto da Antimiano; b. between 970 and 980; d. 1045) was the son of Gariardo, born at Intimiano in the province of Bergamo, Aribert rose through the ranks in the cathedral of Milan and in 1018 became archbishop with the support of Emperor Henry II and the local nobility. He used this position to strengthen the role of the archbishop in the political arena of the city of Milan. He became a strong ally of the German emperors and established a particularly close political and personal relationship with Conrad II, whom he crowned king of Italy in 1026. However, Aribert came into conflict with some of the emperor's feudal representatives in Italy; they poisoned his relations with Conrad, and the ensuing conflict lasted until the emperor's death in 1039. Aribert reestablished good relations with the new emperor, Henry III. When he became a target of civic unrest in Milan, Aribert reasserted his rule, with assistance from the Germans. Having restored peace, Aribert died in Milan on 16 January 1045.

Arichis

Arichis II (c. 735-787 or 788) was duke (from 758) and prince (from 774 or 775) of Benevento. He was invested with the duchy by his father-in-law, Desiderius, king of the Lombards, who hoped thereby to bring the duchy of Benevento more directly under Lombard control. Arichis and

his wife, Adelperga, established a court at Benevento that modeled itself closely on the Lombard court at Pavia and, somewhat later, on the Byzantine court at Constantinople.

After the overthrow of the Lombard kingdom in 774 by Charlemagne, Arichis proclaimed himself prince of Benevento and claimed to be the legitimate continuator of the Lombard line. Although he was forced by the temporary presence of a Frankish army to recognize the overlordship of Charlemagne, Arichis and his successors were for all practical purposes independent until the conquest by the Normans in the eleventh century. Reflecting this independence (even before the fall of the Lombard kingdom), Arichis continued the Beneventan practice of issuing gold and, later, silver coinage. He rebuilt and expanded the fortifications of Benevento and Salerno, remodeled the ducal palace and added a palace chapel dedicated to Saint Sophia (its central plan shows the influence of Ravenna and Constantinople and prefigures Aachen), and liberally endowed a number of religious establishments. After the fall of the Lombard kingdom, Arichis issued seventeen laws to add to the corpus of Lombard legislation and to lend credence to his claims of sovereignty.

Both Arichis and Adelperga were patrons of art and learning, and their court at Benevento became a center of cultural influence. Paul the Deacon resided there for a time and dedicated his early works to Adelperga. Although the relative claims of Benevento and Monte Cassino for the establishment of a "school" are difficult to evaluate, there is no doubt that Benevento was a center of learning, and the work of the chancery, either during the time of Arichis or somewhat later, developed the very beautiful Beneventan script.

After his death, Arichis was succeeded by a younger son, Grimoald III (r. 787 or 788-806).

Arimannus

The Lombard term *arimannus* (plural, *arimannit*) was equivalent to the Latin *exercitalis* and signified a free Lombard soldier and property holder. *Arimanni* were obligated to perform military service, help maintain bridges and roads, and participate in the public courts. By the eighth century, *arimanni* swore an oath of fidelity to the Lombard king. During the late eighth century and the ninth century, the uniform class of Lombard smallholders and soldiers tended to disappear. Many *arimanni* had become tenants or had been forced into other forms of dependency, and their public duties were being privatized. Carolingian legislation aimed at protecting *arimanni* from the oppression of counts and other powerful lords was largely ineffective.

RICHARD RING

Aristippus, Henry

Henry or Henricus Aristippus (d. 1162), a prominent Latin cleric and court figure in the kingdom of Sicily during the reign of William I, brought important Greek philosophical and scientific writings into the intellectual orbit of the medieval Latin west. How he acquired his knowledge of Greek is unknown. His translation of Plato's *Meno* was finished sometime between early 1154 and 10 November 1160. His translation of Plato's *Phaedo* was begun in the spring of 1156 while Aristippus, now archdeacon of Catania, was in camp during William's siege of Benevento. It was completed in Palermo shortly thereafter and

was later revised; two forms are known, both thought to be auctorial. The *Phaedo* and the *Meno* are the only Platonic dialogues that refer by name to an Aristippus; this fact may have some bearing either on Henry Aristippus's adopted byname or, if he was already so called (probably after the ancient Greek philosopher Aristippus, also a Sicilian court figure), on his decision to translate these works. Though they were not the only sources for a knowledge of Plato, these versions in Latin, made from the original Greek, are the only complete translations of any of his dialogues known to have circulated outside the Arab world during the Middle Ages. Henry Aristippus's designedly literal efforts are now and probably always were preserved in relatively few manuscripts, but they were sought out and read by early humanists for whom their content must have been more appealing than their style.

In 1158 Aristippus returned from a diplomatic mission to Constantinople with gifts to the kingdom from the emperor Manuel I Comnenus that included a copy of the Greek text of Ptolemy's *Almagest* and, in all likelihood, the Greek *Prophecy of the Erythrean Sibyl* later translated into Latin by Eugenius of Palermo. The anonymous early translator of the *Almagest* (who had come to Sicily from Salerno in 1158 or 1159) tells us that he found Aristippus investigating, at some personal risk, the wonders of Mount Etna, the volcano whose lava flows have often threatened Catania and its vicinity. Apparently connected with this interest is Aristippus's undated and still only partly edited translation, from the original Greek, of Book 4 of Aristotle's *Meteorology*, a text dealing in part with the liquefying and congealing of matter. Known to Gerard of Cremona (d. 1187), who translated *Meteorology* from the Arabic, this remained the standard Latin version of Book 4 until it was superseded in the thirteenth century by William of Moerbeke's new translation of the entire work. Even so, much of it lived on, as William's version here is largely a revision of Aristippus's. Probably Aristippus's as well, and also known to Gerard, is a translation of the Greek *scholia* (annotations) for this book.

Preserved with the earlier form of Aristippus's translation of the *Phaedo* is a preface praising the king's intellectual curiosity and providing valuable information about secular Greek texts available in Sicily. In the prologue to his translation of the *Meno*, Aristippus parades

his connections with the powerful while proclaiming their interest in this sort of cultural acquisition: the admiral Maio (King William's chief minister) and Hugh, the archbishop of Palermo, have asked him, he says, to translate the ancient Greek Diogenes Laertius's *Lives of the Philosophers*-, and the king himself has commanded him to translate some writings of the Greek church father Gregory of Nazianzus. It is not absolutely certain that these announced versions were completed, but if they were, they may have been the source of quotations from both authors by Aristippus's contemporary John of Salisbury. A lost partial translation of Diogenes Laertius is usually supposed to have been Aristippus's: excerpts from it showing characteristics of his style, which allowed more lexical variation than that of most medieval western word-for-word translators, occur in the widely read *De vita et moribus philosophorum* (*Lives of the Philosophers*), formerly attributed to Walter Burley but now believed to have originated in northern Italy early in the fourteenth century. According to a recent argument, this translation was only of Books 1 and 2 of the Laertian original (plus, perhaps, the *Life of Aristotle* from Book 5), rather than, as commonly thought, of the entire first five books. If so, and if Henry Aristippus really was the translator, then he left it unfinished: the earlier Aristippus and Plato are both in Book 3.

Henry Aristippus's scholarly activity is often said to have ended in November 1160, when, after Maio's assassination, William I chose Aristippus to be his interim chief minister and also head of the royal chancery. Thereafter Aristippus was involved, deeply but ultimately unsuccessfully, in the tumultuous affairs of the kingdom. Suspected by William of complicity in a coup of 1161 that failed but had almost cost the king his life, Aristippus was imprisoned in the spring of 1162 and died soon afterward.

Aristotle and Aristotelianism

In the heyday of scholasticism, Aristotle (384-322 B.C.) was considered "the philosopher" par excellence; his writings offered a comprehensive view of the visible universe and the human condition that presented the first serious challenge to Christian thinkers and theologians of the Middle Ages.

Aristotle was born at Stagira in northern Greece and studied under Plato. He reacted against Plato's reduction of the physical universe and laid the foundations of a scientific approach in the ancient world. Few philosophers have contributed so effectively and enduringly to the study of logic, epistemology, physics, metaphysics, biology, meteorology, mathematics, psychology, rhetoric, dialectic, aesthetics, and politics. Some of the linchpins of his system may be listed. According to Aristotle, the earth is at the center of an eternal universe.

Below the moon, everything is composed of four elements (earth, air, fire, water) and is subject to change and destruction. Everything in the heavens above the first sphere is composed of ether and is immutable. In the sublunar world, rectilinear motion is the norm; above the moon, motion is circular, indicative of perfection. All material things are an indivisible amalgam of "matter" (sheer potentiality) and "form" (the essence of each given thing). Human beings are "political" in that they are social animals born to live in an organized state. Virtue is a mean between two vices: excess and deficiency. Any valid deductive argument can be expressed in one of four perfect syllogisms involving three terms: two premises and a conclusion. For a proper understanding of any natural organism, a teleological explanation must be sought: the purpose or goal of humanity is a life of rational activity. Intellective cognition is to be understood as the reception of abstract concepts; this idea led Aristotle to posit an intellective power which had a purely potential nature: *nous pathetikos*, the passive or "possible" intellect. However, since the reception of abstract concepts must necessarily be preceded by abstraction of the universal content from sensible images, another power, the "active" intellect, is necessary to actualize intellectual potentiality. In Aristotle's *De anima*, this active power is conceived as separate from the body and surviving death, but it is also seen as inseparably joined to the body. Such are a few of the ideas that were to electrify philosophers and generate immense debate, especially from the thirteenth to the sixteenth centuries in western Europe.

The most important influence on Latin Christianity throughout the Middle Ages was Augustine of Hippo (Saint Augustine, 354-430). For ten years before his conversion to Christianity, Augustine had been under the spell of the dualist Manichaen doctrine, which regarded matter as evil. After having rejected this absolute condemnation of the body, Augustine was attracted by some of the tenets of Neoplatonism which he considered "well accommodated" to the Christian faith and therefore exploitable in its defense, especially the view of the soul as a

dynamic principle capable of ruling the body. Augustine was in full agreement with Plato and his followers that philosophical truth is attainable through intellectual reflection rather than through the analysis of sensible, material reality. On the other hand, he firmly rejected the Neoplatonist view of the universe as a series of emanations, in favor of the Judeo-Christian belief in creation *ex nihilo* by the deity.

Boethius (c. 475 or 480-524) set out to translate into Latin the complete works of both Plato and Aristotle, with a commentary intended to iron out their differences. He did not go beyond Aristotle's logic. Nevertheless, his writings remained a philosophical beacon for at least the next 600 years. Until the twelfth century, or even later, Aristotle was known in the Latin west solely through Boethius's translations of *Categories* and *Prior Analytics* (which made the syllogism available as the central tool in logic), as well as Boethius's own treatises on special aspects of logic and his commentary on Porphyry's *Isagoge*. These works formed a corpus known as the "old logic" (*logica vetus*).

Greek thought was, of course, kept alive at Byzantium, and later in the Arab world, especially by the Persian Avicenna (980-1037) and the Andalusian Averroës (1126-1198), who became known as "the commentator" for his attempts to salvage "pure" Aristotelian doctrine. The most controversial result was Averroës's view that there is a single, eternal active intellect for humanity; but far more devastating was his belief in the "unicity" of the possible intellect, which deprived the individual of immortality.

The twelfth century was the golden age of medieval Platonism. However, by the second quarter of that century, James of Venice had already translated into Latin some important works by Aristotle, including his *Posterior Analytics*, *Sophistici elenchi*, and *Metaphysics*. Michael Scot's most influential achievement was his translation of Averroës's commentaries on *De caelo*, *De anima*, *Metaphysics*, and *Physics*, together with Aristotle's texts, during the years he spent in Sicily at the court of Frederick II (c. 1230). Robert Grosseteste's important translation (from the Greek) of *Nicomachean Ethics* was executed c. 1247. In the second half of the thirteenth century, the Dominican William of Moerbeke not only perfected his knowledge of Greek by going to Greece but also became the most prolific translator

of Aristotle's works; his translations included the first Latin versions of *Politics* and *Poetics*. By 1260, about fifty-five of Aristotle's works had been translated into Latin. Beside this "authentic" Aristotle, however, there was a strong current of Neoplatonic thought in medieval Aristotelianism, in Arabic commentaries and then in the Latin west, where it was chiefly due to the influence of Augustine, Pseudo-Dionysius and the pseudo-Aristotelian *Book of Causes*. This is well illustrated in the unfinished *Summa Theologiae* (c. 1270-1275) of Albert the Great:

There are two manners of revelation. One manner is through the light connatural with us, and this is the manner of revelation to the philosophers. This light indeed cannot be except from the first light, of God, as Augustine says in the book, *The Teacher*, and this is very well demonstrated in the *Book of Causes*. The other light is for the perception of entities above the world. . . . The first light shines forth in things known through themselves, but the second in the articles of faith.

With the Aristotelian tools of induction and deduction, and the demonstrative syllogism, logic deposed grammar as the chief area of study, especially in the new university institutions. The University of Paris (founded in 1200) became the intellectual powerhouse of western Europe, despite the continuing opposition to such a powerful philosophical system of pagan origin. The provincial synod of Sens, in 1210, forbade all lecturing on the writings of Aristotle on natural philosophy and their commentaries. The University of Toulouse, founded in 1229, boasted that its masters were free to use Aristotle—until a papal ban was extended there, in 1245. Although Pope Innocent IV reiterated the general prohibition, within ten years all the current works of Aristotle were prescribed for the arts faculty at Paris. Some, indeed, considered "the philosopher," Aristotle, "a kind of precursor of Christ, an intellectual Baptist" (Knowles 1978, 229).

The blending of Aristotle's philosophical system with Christian belief was particularly successful in the encyclopedic writings of the Dominican theologians Albert the Great (Albertus Magnus, Doctor Universalis; c. 1200-1280) and Thomas Aquinas (c. 1225-1274). Despite their valiant efforts to distinguish between rational enquiry and revelation—accompanied by a conviction that "almost the whole of

philosophy is directed toward the knowledge of God" (*Summa contra gentiles*, 1.4)—there was widespread disquiet in the ranks of Augustinian and Franciscan thinkers. Among the latter, Bonaventure (c. 1217-1274) attacked Aristotle's failure to grasp exemplarism as the cause of all his errors. In his Lenten sermons in Paris (late 1260s-early 1270s), Bonaventure highlighted three major obstacles for Christians: the belief in the "unicity" of the human intellect, which precluded the immortality of the individual; the eternity of the world, which denied God's creation and divine providence; and the independent study of philosophy, deemed to provide definitive wisdom and happiness rather than acting as the handmaiden of theology. This intellectual "divorce" was practiced, with dire consequences, by Siger of Brabant (who died c. 1283). Siger criticized Albert and Aquinas for distorting the Greek philosopher's thought. In his *De anima* (1269-1270), he gave currency to Averroes's theory that intellect is external to the individual. This provoked a sharp reaction from Aquinas, who denied that the possible intellect was a separate substance and reaffirmed the importance of free will (*On the Unity of the Intellect*, 1270). The year 1270 also saw the condemnation of thirteen philosophical errors and the excommunication of those who taught them: they included the doctrine of the eternity of the world and the "unicity" of intellectual souls. In 1277, after the inquisitor of France had summoned Siger and two others to appear before him, Archbishop Etsenne Tempier formed a commission of sixteen theologians that hurriedly condemned a hodgepodge of no fewer than 219 propositions (forty-four came from Siger, sixteen from Boethius of Dacia). Eventually, however, in his *Questions on the Book of Causes* (1275-1276), Siger recognized that the doctrine of the unique intellect was heretical (and, possibly, irrational). In *Paradiso* (10.133-138) Dante, strikingly, placed him among the wise. That other radical Aristotelian, Boethius of Dacia, boldly stated the dilemma with regard to the Christian belief in the resurrection of the body when he asserted: "Who does not believe this is a heretic; on the other hand, who seeks to know it by reason is a fool." Boethius also expounded the Aristotelian doctrine that the intellectual life is the highest good for man—one of the propositions condemned in 1277 ("that there is no more excellent state than to devote oneself to philosophy").

The discovery of Aristotle's *Politics* had far-reaching consequences for political thought. Here, Aquinas's most radical move was to deny Augustine's view of the state as a remedy for sin based on force. Instead, Aquinas propounded the Aristotelian view that human nature requires an organized state. Yet after 1277, the golden age of Christian syncretism for which Albert and Thomas had worked so valiantly was over. Symptomatic of the reaction by conservative churchmen is the following statement made by the Augustinian theologian Ugolino of Orvieto in the fourteenth century: "For the most part ethics is a false doctrine. . . . Aristotle did not know virtue but only the semblance of the virtues, nor did he give proper rules." Plato was soon to be in the ascendant once again. From 1367 to 1370, Petrarch wrote his famous Latin treatise *On His Own Ignorance and That of Many Others*, in which he attacked the pretensions of Aristotelian science and its inability to encompass the transcendent while he agreed with Augustine that Plato would undoubtedly have been a Christian if he had lived after Christ: "Aristotle explains what virtue is . . . but reading his works does not offer . . . those words that set on fire the heart and make it love virtue and detest vice. Whoever seeks them out will find them ... in Cicero and Seneca, above all." The way was open to Renaissance humanism and its philosophical syncretism, so memorably illustrated in Raphael's *School of Athens* (c. 1510), where we find Aristotle and Plato once again at center stage: Aristotle with a hand outstretched to cover the physical world, Plato with a finger pointing toward the transcendental world of ideas.

Arnold of Brescia

The blurriness of the line separating radical reformers from heretics is dramatically evident in the career of the cleric and ecclesiastical critic Arnold of Brescia (c. 1100-1155). The backdrop for this drama was Patarine error, Hildebrandine reform, Italian communalism, and the struggle between pope and emperor. However, at many points the record is silent, sketchy, or contradictory. Of Arnold's origins and youth we know nothing, and the idea that he studied with Peter Abelard in

Paris c. 1115-1119 is speculation based on Arnold's later defense of Abelard. Whether or not Arnold was ordained, he became a canon of the Augustinian friary in Brescia c. 1120 and served as prior. His moral life remained free from criticism, even by his enemies. Saint Bernard of Clairvaux, who heartily opposed both Arnold and Abelard, nevertheless described Arnold as "a man who comes neither eating nor drinking . . . whose life is as sweet as honey." John of Salisbury, who served in the papal court, said that Arnold was "a priest by office, a canon regular by profession, and one who had mortified his flesh with fasting and coarse raiment: of keen intelligence, persevering in the study of the scriptures, eloquent of speech and a vehement preacher against the vanities of the world."

In the mid-1130s, Prior Arnold became involved in a movement against Bishop Manfred of Brescia, whose efforts at reform had angered the local clergy and had, among the populace, added to the impetus for communalism. Arnold probably admired the bishop's efforts to end simony and clerical marriage, but he stood against the clerical hierarchy and sympathized with the people's defense of their political "liberties." Whatever his actual activity may have been, he was condemned as schismatic by the Second Lateran Council, was exiled from Brescia, and apparently wandered as an itinerant preacher in Lombardy in 1139-1140. In the spring of 1140, he traveled to Sens, where he accompanied Abelard in the latter's defense against the accusations of Bernard of Clairvaux. Abelard's failure to sway the council resulted in the condemnation and burning of books containing his errors and those of Arnold, a sentence confirmed by the pope. No works by Arnold survive, nor do contemporary references to any of his works, so it is unclear which books were meant in this sentence; it is also unclear whether Arnold's ideas were spreading through written sources as well as by his preaching.

Arnold immediately set himself up in Abelard's old school on Mont-Sainte-Geneviève in Paris, where he railed against Bernard and against the church's unholy wealth and temporal power. Reflecting Patarine ideas, and anticipating those of later groups, he fervently believed that preaching the gospel could not be accompanied by the accumulation and use of wealth and political authority, and that the church must divest itself of these things in order to adhere to the gospels. The clergy

had rights to no funds other than ecclesiastical tithes, first fruits, and freewill offerings and should have no hierarchical organization. The laity should be free to organize their communal life as they saw fit. These concepts were not heretical, but neither were they ideas with which any authorities of the period were comfortable. Bernard persuaded Louis VII to exile Arnold from French territory, and Arnold went to Zurich, where he continued to preach church reform and to be hounded by Bernard's missives. Moving to Passau in 1142 or 1143, he befriended the local bishop and papal legate, Guido. Arnold was subsequently reconciled with Pope Eugenius III at Viterbo in 1145 or 1146.

A penance imposed by the papacy, and possibly Guido's patronage, took Arnold to Rome shortly thereafter. Here he gathered a following because of his public sermons and disputations and his reputation for piety and asceticism. He continued to attack the vices and wealth of the clergy and the nature of the ecclesiastical hierarchy, gradually developing from a critic to a radical demagogue. His support came initially from the lower clergy and devout women and later, more broadly, from the lower classes in Rome, where antipapal communalism had been active since 1143. This pressure forced Pope Eugenius to flee in 1147, and from Brescia the pope issued an ineffective bull branding Arnold as a schismatic (though not a heretic) and forbidding the clergy to have contact with him.

The Roman aristocracy, dueling with the pope for political control of Rome, found the newly demagogic Arnold a useful ally who could deliver and control the support of the lower classes. The Roman senate and Arnold exchanged oaths of loyalty, in regard of which the senators refused to hand Arnold over to the pope, who had returned and made his peace with the new Roman republic in 1149. With this settlement between Eugenius and the republic, Arnold's influence began to wane, although in mid-1152 he nonetheless attempted a coup, supported only by the lower classes. According to Eugenius's agreement with the republic, his followers were to be made senators, and a new emperor would be elected in Rome but would remain only a symbolic figure in the self-governing commune. Despite its failure, this move led the pope to arrange the Treaty of Constance (1153) for mutual support with the newly elected but uncrowned Frederick I Barbarossa.

When Nicholas Breakspeare became Pope Hadrian IV in 1155, he demanded Arnold's expulsion and the dismantling of the republic and put the city under interdict during Holy Week to enforce his will. Both the mob and the senate quickly abandoned their republic and Arnold for the eucharist, and Arnold fled north toward Tuscany. At Brice he was captured by Cardinal Odo, but he was soon rescued by the counts of Campagna. When Frederick, advancing on Rome for his coronation, captured one of the counts, Arnold was exchanged for the hostage. In Rome, there was armed resistance to the return of the pope and to the imperial coronation (18 June 1155); and the subsequent flight of emperor and pope from Rome convinced Frederick that he should put Arnold before a canonical tribunal. The tribunal condemned Arnold, and the Roman prefect, or chief criminal magistrate, carried out the civil sentence of hanging and burning. Arnold's ashes were dumped into the Tiber.

Arnold's legacy is twofold, lending subsequent support to Roman republican communalism and to radical ecclesiastical reform: the poor and pure church. One strand leads to Brancione and Cola di Rienzo and the other to the Waldensians and Spiritual Franciscans. His most immediate effect may have been the establishment of the Arnoldist sect, whose members shared many of Arnold's ideas but in addition heretically denied the efficacy of the sacraments.

Arnolfo Di Cambio

Arnolfo (c. 1245 or 1250-1302 or 1305) was one of the more prolific and innovative Italian sculptors and architects of the late thirteenth century. He was born near Florence, in the town of Colle Val d'Elsa, and was trained in the workshop of Nicola Pisano together with his contemporaries Giovanni Pisano and Tino da Camaino. Arnolfo, Giovanni, and Tino developed into strikingly different masters. While Giovanni's art became increasingly "expressionistic" and leaned more toward French Gothic, Arnolfo's and Tino's sculpture continued Nicola Pisano's more classical, reserved manner. During his later years, Arnolfo also distinguished himself as an architect in Florence.

Arnolfo is first documented in 1265 as one of Nicola Pisano's assistants on the Area of San Domenico in Bologna (1264-1267); he then worked on the pulpit for Siena Cathedral (1265-1268); and the Fontana Maggiore in Perugia (1277-1281). It is clear that by the time of the commission in Perugia, Arnolfo was already in the service of King Charles of Anjou. This is confirmed in a letter that Charles sent to the Perugian authorities in 1277, releasing the mason "Magister Arnulfus de Florentia" to work on a fountain. For Charles himself, who was resident in Rome as the senator of that city, Arnolfo served as a court mason, becoming conversant with ancient Roman art and architecture and the

decorative manner of the contemporary Cosmati workshops. Arnolfo's appointment at the court put him into position to receive royal commissions, such as a seated portrait of Charles dated before 1278 (now in the Museo Capitolino in Rome); it also led to important commissions from high-ranking curial patrons, including two altar canopies in Roman basilicas and a small though highly influential series of sepulchral monuments in Rome and Orvieto. Inscriptions of 1285 and 1293 establish that "Arnolfus" was responsible for the altar canopies in two Roman churches: San Paolo fuori le Mura and Santa Cecilia. These canopies, both of marble with rich Cosmati-style ornamentation, seem to have been part of larger redecorating projects at the two churches, projects in which the fresco painter Pietro Cavallini was also involved. For these commissions, or at least for the canopy in San Paolo, Arnolfo may have collaborated with Piero Oderisi.

Arnolfo's best-documented sepulchral works include tombs erected for Cardinal Guillaume de Bray (San Domenico, Orvieto, after 1282); Pope Honorius IV (Santa Maria in Aracoeli, Rome, after 1287); Cardinal Riccardo Annibaldi (San Giovanni in Laterano, Rome, after 1289); and Pope Boniface VIII (old Saint Peter's, Rome, after 1303). Boniface's tomb, now destroyed, was part of an entire chapel; a recorded inscription on it mentioned "Arnolfus Architectus," indicating that Arnolfo had been responsible for both the architecture of the chapel and its sculpture. Finally, a statue of a deacon with a part of a curtain (now in the Walker Art Gallery in Liverpool) is believed to be a fragment from a fifth sepulchral monument. Of these tombs, de Bray's was perhaps the most influential, and today—despite a problematic reconstruction—it is the best preserved. This monument is a large wall construction with an elaborate base; an effigy and accompanying acolytes who draw back curtains in the middle register; and a kneeling resurrected de Bray, patron saints, a dedicatory inscription, and a Madonna and Child at the summit. Every surface that is not a figure is embellished with mosaic inlay in the Cosmati style.

The multiple figures in de Bray's tomb and the other tombs were also a feature of Arnolfo's unfinished (and now dismantled) facade for the cathedral of Florence (c. 1300); its original appearance is known from a sixteenth-century drawing in the Opera del Duomo in Florence. Many parts of this facade, both statuettes and relief carvings, are also

preserved in the Opera del Duomo. Arnolfo certainly received the commission for the facade in conjunction with his control of the architecture of the cathedral itself. He is widely believed to have been the architect of the cathedral, for which he was appointed *capomaestro* (foreman) in 1300.

Architectural historians also attribute to Arnolfo the designs of other building projects in Florence that were begun during a boom in the last decade of the thirteenth century. These buildings include the Benedictine church of the Badia, the Franciscan church of Santa Croce, and the civic Palazzo della Signoria. They are clearly indebted to his knowledge of late Roman and early Christian buildings and are characterized by bold powerful massing, large unencumbered spatial volumes, and—unlike the facade of the cathedral—a minimum of ornamentation. Today, only the Badia, which was substantially remodeled by Giorgio Vasari in the sixteenth century, gives little evidence of its original appearance. The Palazzo della Signoria strongly influenced the design of other civic *palazzi* in Tuscany as well as the development of private *palazzo* architecture in the fourteenth and fifteenth centuries.

Arnolfo died sometime in the first decade of the fourteenth century.

Arnulf of Carinthia

Arnulf (c. 850-899), grandson of Louis the German and son of King Carloman of Bavaria—was the last member of the Carolingian family to hold the office of Holy Roman emperor. Arnulf began his career as margrave of Carinthia in the service of his father. In 887, he led a revolt against his uncle, the ineffective emperor Charles III the Fat, and was elected ruler of the East Frankish kingdom. As king, he demonstrated considerable political talent in defending his realm against external enemies, resisting the efforts of powerful nobles to weaken the royal power, and winning the support of the clergy. After the death of Charles the Fat in 888, Arnulf recognized the non-Carolingians elected as kings of West Francia, Provence, Burgundy, and Italy. In return for his support in legitimatizing these rulers, and partly because of their respect for his Carolingian lineage, he was able to exercise a vague lordship over them. As a consequence of his preeminence among contemporary rulers, Arnulf emerged as a leading candidate to become emperor. In 894 and 895, he responded to the appeals of Pope Formosus for protection against Emperor Guy of Spoleto. Arnulf's capture of Rome in 895 led to his coronation as emperor in early 896. But he was paralyzed by a stroke soon thereafter and so was unable to exploit the imperial office to prevent the final dissolution of the Carolingian empire.

Arrigo Da Settimello

Arrigo (Henry) of Settimello is Italy's leading Latin poet of what is called the twelfth-century Renaissance. Almost all we know about him is inferred from the only poem transmitted under his name, the 1,004-line *Elegia* ("Elegy," dated 1193 on the basis of internal evidence). Its speaker, conventionally and probably correctly assumed to represent the poet, is named Henry (Henricus; in Italian, Arrigo or Enrico). We are told that he is poor, of rural origin, and a priest; further, that he studied at Bologna, was once prosperous but has suffered a reversal of fortune and with it public disgrace, and is in the service of the bishop of Florence, to whom he issues a concluding appeal for relief. Local tradition, surviving paratextually in manuscripts of the poem as well as in a life by Filippo Villani, adds that Henry came from Settimello (near Prato), that the reversal in question was his loss of the nearby benefice of Calenzano, and that he served as *cancellarius* to bishops of Florence and of Volterra. Some of this information may be true.

Elegia is so called from its meter—elegiac distichs—and perhaps also because this verse form was thought particularly appropriate to sorrowful occasions. It is a lament in four books of 250 lines each, followed by a four-line conclusion. It consists largely of a diatribe against fortune (in Books 1 and 2) followed by a consolation from philosophy (in Books 3 and 4; the latter is chiefly precepts). This Boethian theme is expressed in a modern style of quasi-antique Latin verse made famous by such French contemporaries as Matthew of

Vendome and Alan of Lille. Henry's reminiscences of ancient and medieval *auctores* testify to his reading, and the presence of Ovid is especially notable: much of the dialogue is written in Ovid's elegiac manner. The combination of moral and stylistic excellence in *Elegia* made it popular for the next several centuries. It was read in schools, and "poor" or "humble" Henry (in Latin, *Henricus pauper*, in Italian, *Arrighetto*) was also excerpted in florilegia and is quoted or referred to, either in Latin or in one of two fourteenth-century Italian translations, by a wide range of later medieval Italian authors.

Arrigo Testa

Most scholars consider the poet Arrigo Testa to be the same person as a powerful nobleman of that name who between 1228 and 1247, as a close ally of the emperor, was *podestà* (podesta) in several cities—among them Jesi, Siena, Ravenna, Lucca, and finally Parma, where, according to the chronicler Salimbene, he lived almost like a king. The podesta Arrigo died in a skirmish on the Taro River near Parma in 1247. If this identification is correct, the poet Arrigo Testa was a native of Arezzo, but the attributions that accompany his only surviving poem leave room for doubt. The Vatican Codex (Lat. 3793) attributes the poem to Notaio Arigo Testa da Lentino; Lentino is in Sicily, and there is documentary evidence for the existence of a Testa family there. This Arrigo Testa's canzone, *Vostr' orgogliosa ciera*, is noted for its skillful changes in tone.

Ars Dictaminis

Ars dictaminis is the medieval art of letter-writing. Between the late eleventh century and the mid-fifteenth century it involved a highly formalized code of rules for the composition of prose letters in Latin. *Dictamen* manuals did recognize that letters could also be composed in verse or in *prosimetron*, a mixture of prose and poetry; however, these manuals were themselves concerned solely with prose communication. While eloquent expression was emphasized, the primary goal of the instruction was practical: a letter was meant to persuade the recipient to grant whatever the writer was seeking. In classical antiquity, a letter had been considered a form of conversation and was not subject to rules; thus *ars dictaminis* was an original creation of medieval culture.

This art arose out of a need for increased communication in a society that was experiencing rapid economic and political development but had a low standard of literacy in Latin. The manuals, which set forth detailed rules and provided a wide range of sample letters, made letter-writing accessible even to people who had only a modest grasp of Latin. From its origins in Italy in the late eleventh century, *ars dictaminis* spread rapidly to northern Europe during the twelfth century. The styles varied from simple to elaborate, but the basic formulas and rules of organization remained remarkably similar throughout western Europe, thereby affording a standardized mode of international communication.

Medieval letters were a product of a highly oral culture, designed to be read aloud either by or to their recipients; thus they took on an oratorical character unknown in either ancient or modern letters. This helps to explain why the writers of manuals felt justified in utilizing, even as fragments, the rules governing oratory found in ancient textbooks such as Cicero's *De inventione* and the Pseudo-Ciceronian *Ad Herennium*. Like an oration, a letter was strictly divided into distinct sections. By 1150, the five divisions of the letter—(1) *salutatio*, (2)

exordium, (3) *narratio*, (4) *petitio*, and (5) *conclusio*—had become almost invariant. Frequently, the manuals supplied a choice of words or phrases appropriate for introducing parts 2 through 5. A large portion of every manual was usually devoted to discussing the formulas in the *salutatio* and *exordium*, which were cast to please and convince the reader. In contrast, very little space was given to the *narratio*, because this was potentially the part of the letter least amenable to structure. The intent of the manuals was to constrict the writer's freedom of invention, and so—citing Horace's dictum on brevity (*Ars poetica*, 25-26)—they emphasized that the *narratio* should be reduced to the briefest possible statement of facts. Like a speech, a letter was expected to be efficient, and no allowance was made for digressions that did not serve its central objective. From the late twelfth century on, the formal character of the letter was enhanced by the introduction of a series of prose meters to be used at the end (and in some cases the beginning) of clauses and sentences.

Letters conceived along such impersonal lines suited official purposes very well. Indeed, *ars dictaminis* provided an international language of diplomatic protocol in which formulas or structure signaled the favor or disfavor of those in power—or a subtle range of differences between favor and disfavor. At the same time, the manuals were tyrannical, imposing stylistic prescriptions and discouraging the qualities that give a personal letter its character: spontaneity and direct expression of thoughts and feelings. Furthermore, the demand for brevity (*brevitas*) gave the letter writer little opportunity for the kind of philosophical rumination and anecdotal meandering found in the personal letters of other eras. In Italy, the generation of Peter Damian (d. 1073) and Gregory VII (d. 1085) was the last until the advent of humanism in the fourteenth century to give correspondence a personal tone. The death of Peter of Blois in 1205 marked an eclipse, north of the Alps, of the ancient concept of a letter as conversation.

Alberic who is generally recognized as the author or the first manual of *ars dictaminis* (c. 1075), was a monk of Monte Cassino in the south, but almost immediately the lead in the development of the art shifted to northern and central Italy. For a brief time in the last third of the twelfth century, France rivaled Italy in creativity; but Italy regained predominance in the early thirteenth century, primarily because of the

work of three great masters in Bologna—Boncompagno da Signa, Bene of Florence, and Guido Faba—and thereafter never lost it. Copies or imitations of the writings of the three Bolognese masters are found today in libraries throughout western and eastern Europe.

Ars dictaminis appears to have had little effect on vernacular letters, which made their appearance early in the thirteenth century. Brunetto Latini's *Rettorica*, an uncompleted commentary on Cicero's *De inventione* written in Tuscan in the 1260s, represents the first attempt to provide rules for composing letters as well as speeches in the vernacular. Brunetto is also the probable author of *Sommetta ad amaestramento di componere volgarmente letterc*, this was the first manual expressly intended to teach letter-writing in the vernacular and was to remain the only one of its kind until the last half of the fifteenth century. From the fourteenth century on there were vernacular translations of Latin manuals, but these were not numerous. A survey of actual vernacular letters indicates that as late as the mid-fifteenth century they remained relatively idiosyncratic and were not subject to restrictive formulas. After that time, manuals and actual letters reflect the influence of Latin humanism rather than *ars dictaminis*.

In Italy, unlike France, the letter played almost no role in literary prose and poetry. The letter form is prominent in the *salutz* of mid-twelfth-century Provence and later in the French *salut d'amour*, the *dit*, and prose and poetic *romans*; but in Italy, with the exception of the *Filostrato* of Boccaccio (1313-1375), this form does not appear in the rich production of literary works in Provencal and native Italian dialects. The strong practical associations of the letter form in Italy perhaps hindered its use for other purposes.

By the end of the thirteenth century, the great age of *dictamen* was already past. The production of new Latin manuals continued undiminished for almost another century, but creativity had disappeared, and perhaps the major point of contention among the writers was the names and appearance of the signs of punctuation. During this period a new literary movement, humanism, was on the rise. The humanists were concerned, in part, with reasserting the classical concept of the letter as conversation, and so they represented a challenge to the dominance of *an dictaminis*. The first letters that survive in the new classicizing style are those of Geri d'Arezzo written

in the 1320s. Geri, clearly influenced by Seneca, implicitly adhered to the idea of the letter as conversation, although this idea was not made explicit until thirty years later, in Petrarch's introductory letter to *Rerum familiarium*.

If by 1400, *ars dictaminis* had ceded its control over the personal or private letter to humanism, it proved more resilient in the domain of the public or official letter. After 1400, even in Italian chanceries where humanists were in charge, it was difficult to make sweeping changes in long-standing traditions. As a result, during the course of the fifteenth century *ars dictaminis* came to be joined with humanism, creating the formulas and structure of a new official style characteristic of the early modern era.

Ars Nova

Ars nova is the written tradition of polyphonic art music of fourteenth-century and early fifteenth-century Italy. The term was first used c. 1300 by Parisian music theorists to describe a notable advance in rhythmic notation. Although contemporary Italians did not use this term, modern musicologists have found it apt to describe distinctively new musical developments that began at about the same time in Italy. The Italian *an nova* maintained its indigenous genres and notation quite independent of French developments through the last quarter of the fourteenth century, but by the second quarter of the fifteenth century it had merged with the French style.

Music of the Italian *ars nova* was an elite art cultivated in only a few geographical regions, mostly at the courts of the Scaligeri (in Verona and Padua) and the Visconti (in Milan) and in elite circles in Florence. The extant repertoire comprises more than 600 works—madrigals, *ballate*, and *cacce*—composed between c. 1335 and 1420. There are also some thirty Latin motets and motet fragments (one dating from 1305); over 150 sacred works and *laude* that set sacred text to known *ballate*; some instrumental dance pieces; and a handful of instrumental arrangements of songs, presumably for keyboard.

The Italian *ars nova* has its roots in the troubadour art cultivated in northern Italy. Italians prized the lyrics and music of the troubadours more than their own vernacular works. Troubadours writing in Old Occitan were prominent in northern Italy beginning in the late twelfth century, and their songs were performed at northern Italian courts—Montferrat, Genoa, Ferrara, and Treviso—throughout the thirteenth century. Indeed, we owe more than half of the extant sources of troubadour lyric poetry to the antiquarian collecting efforts of the northern Italians from the mid-thirteenth century to the mid-fourteenth. Of forty-one major extant manuscripts, twenty-seven are of Italian provenance. In addition, almost all of some twenty sources of *vidas* and *razos* of the troubadours, the biographical notices of the troubadours and commentaries on individual poems, were written in Italy, as was one of only two extant troubadour *chansonniers* with melodies (Milan, Biblioteca Ambrosiana, S. P. 4, *olim* R 71 sup.).

In the early fourteenth century, Dante, who may have heard troubadour music in Verona at the court of Cangrande della Scala (whose sons Alberto and Mastino would be patrons of *ars nova*

composers), expressed his esteem for Occitan poetry; and the Florentine Francesco da Barberino cites twenty-five troubadours in his *Documenti d'amore* (c. 1315). The works still resounded for Petrarch, who names fifteen troubadours in his *Triumphus cupidinis* (*Triumph of Love*).

In the mid-thirteenth century, the period of the Sicilian school, and continuing in the *dolce stil novo* of the late thirteenth century, Italian poets composed vernacular lyrics not intended for musical settings, at first imitating the Occitan lyrics. (The break between poetry and music thus came in Italy more than a century before the break was acknowledged in France.) Dante stipulated in his *De vulgari eloquentia* (c. 1305; see II.3-4 and 8) that music was suitable more for the "mediocre" style of the *ballata*, while the more elevated *canzone* enjoyed its own natural musicality through the pleasing harmony of formal stanzaic structures, rhyme scheme, and syllable count. Although a few of Dante's *canzoni* and *ballate* were set to a simple monophonic music by friends (Dante names in *Purgatorio* 2 one Casella, none of whose music survives), his authority confirmed a clear split in *ars nova* between higher poetic forms not set to music (*canzoni* and some *ballate*) and lesser poetic genres suitable for musical settings (*ballate*, madrigals, and *cacce*). Almost all the early madrigals and all the *cacce* were *poesie per musica*: poems written solely to be set to music and not considered literary works. Indeed these forms earned the contempt of literary theorists such as Francesco da Barberino and Antonio da Tempo.

The poetic genres set to music in *ars nova* are systematically defined in the anonymous *Capitulum de vocibus applicatis verbis* (Veneto, c. 1315-1320), a brief treatise that complements one manuscript of Antonio da Tempo's more thorough treatment, *Summa artis rithimici vulgaris dictaminis* (1332). *Capitulum* covers all the secular genres of *ars nova*: *ballade*, *rotundelli*, *motteti*, *cacie* or *incalci*, *madrigalia*, and *soni* or *sonetti*. The *ballata*, motet, *caccia*, and madrigal are the principal genres; Italian *rondeaux* (*rotundelli*) are extremely rare (there is only one known example); and *soni* is a term contemporaries applied to *ballate* not intended for dancing.

Of these forms, the *ballata* was the most popular. We have texts of some *ballate* or *danze* copied into late thirteenth- and early fourteenth-century notarial acts from Bologna, always without music, doubtless

because courtiers were expected to improvise suitable music for dancing. Boccaccio's *Decameron* (1348-1353), which includes eleven complete *ballata* texts, affirms the popularity of *ballata* performances among upper-class Florentines. *Ballate* could be sung by a soloist as others listened, danced, or joined in at the *ripresa*; *ballate* were also performed as pure instrumental music. (Such practices are illustrated by the nine figures in a round dance with a singing tambourine player in Ambrogio Lorenzetti's fresco *The Effects of Good Government*, c. 1338–1340, in the Palazzo Pubblico of Siena.)

None of these *ballate*, however, is part of the written *ars nova* repertoire. Nino Pirrotta emphasized the exceptional nature of written music in the Middle Ages, music reserved for special occasions by a very limited elite, and we must remind ourselves that the sophisticated *ars nova* polyphony which we prize today was not much known at the time. Instead, one was far more likely to encounter simple *ballate*, the dance songs performed throughout fourteenth century; or—even more likely—one might encounter lay societies throughout Italy singing *laude*, spiritual counterparts to the *ballata*, perhaps as sacred *contrafacta* of lost secular *ballate*.

The few examples of written monophonic *ballate* we have are doubtless far more sophisticated than the everyday fare, and no longer suitable for dancing: five in the early Rossi Codex and a few more among the earlier composers in the Squarcialupi Codex. After c. 1360, however, the *ballata* was transformed into a polyphonic genre, composed first in two voices and later in three. It soon surpassed the madrigal as the most popular genre, and in the end a full two-thirds of the *ars nova* repertoire, more than 400 works, are polyphonic *ballate*. Francesco Landini alone wrote 141. As a further indication of their popularity, many of Landini's *ballate* were adapted as sacred *laude*.

Though not found in Dante's writing, the madrigal was established in his lifetime. The first mention appears in Francesco da Barberino's Latin gloss to his *Documenti d'amore* (c. 1315; Vol. 1, 260, in Egidi's edition), and it is likely that a gloss later in the work also refers to early cultivation of the madrigal: "In my opinion, the old songs, exhibiting the *dolce stil novo* [*habentibus dulces novas*] and few notes, have more to delight the spirits of discriminating listeners" (Vol. 3, p. 20). Francesco may thus characterize an important trait of the new style, the

exuberant melismas prominent in the madrigal. The description of the madrigal in *Capitulum de vocibus applicatis verbis* mirrors the actual compositions found in the manuscripts, calling for strophes of seven or eleven syllables, a tenor in long notes and one or two other voices in short notes, in perfect time and in *aere italico* (*duodenaria* division), mixing in passages in *aere gallico* (*novenaria* division), especially at the *ritornello* (refrain). The earliest extant madrigals, twenty-nine works for two voices, appear in the Rossi Codex of around 1350, though perhaps some of this anonymous repertoire can be pushed back to about 1335. The simple harmonies supporting exuberant *fioretture* of the earliest written madrigals suggest earlier cultivation in an oral tradition. In fact, striking variants among works in concordant manuscripts may document a continuing wide latitude for improvisation; the variants go well beyond what one sees in contemporary French works.

A "classic" *ars nova* madrigal style is seen in works of the first generation of northern composers. The texts are pastoral, as called for in *Capitulum de vocibus applicatis verbis*, often embedding *senhals* (code names), emblems, and symbols. After c. 1360, the popularity of the madrigal waned, although madrigals continued to be written up to c. 1415, and many of the few extant examples are autobiographical, moralizing, or occasional. Two-voice polyphony was always favored for the madrigal: about 90 percent of the some 200 extant *ars nova* madrigals are for two voices.

No *cacce* survive of the type defined in *Capitulum de vocibus applicatis verbis*, involving five singers and a technique of voice exchange. Those we have (there are only about twenty-five *cacce* in the entire *ars nova* repertoire) use two voices in canonic imitation over an accompanying voice without text. The texts, descriptive of hunting or other highly evocative outdoor scenes (fishing, sailing, market scenes, etc.), are either in madrigal form (most with *ritomelli*) or in unrhymed irregular heterometric lines in long stanzas.

Scholars have only recently isolated characteristics of an indigenous Italian *ars nova* motet genre. About thirty works are known, many surviving only as fragments; a few are for sacred functions, but most celebrate doges, bishops, and powerful lords. Cultivation of the motet may have depended on local custom; as noted above, the madrigal takes on the occasional function of the motet in late fourteenth-century

Florence.

It is often stated that Italian *ars nova* music came from nowhere, since it lacked the polyphonic tradition long established in France; and that it disappeared without a trace, forced aside by French art. The actual situation is more nuanced. At the beginning of the fourteenth century, neither France nor Italy cultivated polyphonic settings of vernacular lyrics. French polyphony, primarily in the form of the Latin and French motet, was the art of highly specialized clerics centered in Paris, a milieu for the most part completely separate from the southern troubadours and northern *trouvères*, with their vernacular lyric poetry and monophonic music. Just as the application of polyphony to French lyrics in the fourteenth century was a new development, accomplished at the hands of poet-clerics such as Guillaume de Machaut (c. 1300-1377), so too lyrics were first set to polyphony in fourteenth-century Italy at the hands of university trained clerics, composers who were for the most part priests, members of religious orders, or church organists.

Simple two-voice polyphonic elaboration of plainchant had been described in Italy as early as Guido of Arezzo (c. 995-c. 1050), and a few unmeasured written examples of this mainly improvised practice survive from the thirteenth century onward (*cantus planus binatim*). The learned polyphony of France, the motet, derived from Parisian liturgical polyphony of the late twelfth century and the early thirteenth, does not seem to have been known in Italy until the late thirteenth century. Italians soon became conversant with the leading theory of French mensural notation, that of Franco of Cologne (c. 1280), judging from the many surviving abbreviations of Franco's theory copied in Italy, beginning with the formula *Gaudent brevitatem moderni*.

The French *ars nova* of the early fourteenth century, propounded by a circle of clerics in Paris, expands Franco's theory, providing a rational and flexible notational system for motets. The French mathematician Jean de Muris proclaimed that "what can be sung can also be notated," discussing intricacies of syncopation and the proportional combination of meters that would not be utilized even in the practical sources for many years. An indigenous Italian notational system developed from the same foundation in Franco, but apparently Italian notation was designed from the start to serve practicing musicians; it was a means of

notating and organizing the virtuosic and flowery vocal style lamented by Francesco da Barberino.

An early treatise attached to one of the Franconian *Gaudet brevitatem moderni* compendiums lays out the essentials of Italian *ars nova* notation at the earliest stage: (1) imperfect time, or duple meter, now coequal with perfect time, or triple meter ("perfect" time was cultivated first by the French because of its doctrinal authorization in the Trinity); and (2) division of the imperfect breve into faster notes, four or six semibreves. *Capitulum de vocibus applicatis verbis* labels the subdivision of the imperfect breve into six semibreves the "French air" (*aer gallicus*), and indeed this division is ubiquitous in motets and songs of the French *ars nova*; the subdivision of the imperfect breve into four semibreves is labeled the "Italian air" (*aer ytallicus*). Two other early treatises indicate the delimitation of semibreve groups by dots of division, similar in function to the modern bar line.

Marchettus of Padua stands as the primary figure in the systematic codification of the new developments in Italian notation. Jacopo da Bologna, in his madrigal *Oselletto saivaço*, mentions "Filipoti e Marcheti," acknowledging the two musical authorities, Philippe de Vitry on the French side and Marchettus on the Italian side. Marchettus's early motet, *Ave regina coelorum/Mater innocencie/Ite missa est*, probably composed while he was serving as cantor at the cathedral of Padua (1305-1307), gives little evidence of a new style. Marchettus must therefore have consolidated the new notational system between c. 1310 and 1320. His *Pomerium in arte musice mensurate*, written at Cesena c. 1317-1319, documents a fully formed system.

In Marchettus's theory, the perfect breve of Franco and the newly accepted imperfect breve are subject to three levels of division. The perfect breve can be divided into three semibreves (*ternaria*), and these three can in turn be divided into six minims (*senaria perfecta*), nine minims (*novenaria*), or twelve minims (*duodenaria*). The imperfect breve can be divided into two semibreves, and these two can be further divided into four minims (*quaternaria*), six minims (*senaria imperfecta*), or eight minims (*ottonaria*). Letters served as meter signatures: .d. for *duodenaria*, .o. for *ottonaria*, etc. Confirming the "airs" noted in *Capitulum*, Marchettus observed that Italians preferred the divisions featuring binary groupings—*senaria perfecta*, *ottonaria*,

and *duodena ria*—while the French preferred ternary groupings. The rhythmic profile of the *senaria imperfecta* was so distinct from the *senaria perfecta* that Marchettus advocated identifying them by nationality: G (*gallicus*), or Y (*ytallicus*). Meter signatures of .sg. (*senaria gallica*) and .sy. (*senaria ytallica*) are indeed encountered in the Rossi Codex, and such changes within a composition are common in the madrigal. Gallo has related the facile shifts between styles perceived as French and Italian to the bilingualism common among northern Italian poets.

As in the early French *ars nova* practice, the actual durations of individual semibreves within a group could vary, depending on the context. (Marchettus dubbed certain default durations—which were distinct from the French defaults—the *via naturae*, and departures from the norm the *via artis*.) In France, from about 1320 on, the systematic addition of stems to all short notes (minims) allowed strict prescription of all durations, and the dots delimiting measure were eliminated, facilitating the notation of hockets that helped articulate sections in highly structured motets. The revised French system easily allowed the notation of complex syncopations, something that was very restricted in the Italian system. The Italians retained the dots of division, allowing for a more exuberant melismatic *melos*. Italians also cultivated the possibility of changing meters and contrasting metrical patterns in ways very different from the French. In the end, the greater flexibility and international currency of the French system won the day, but the Italian system maintained itself as the ideal notation for indigenous genres and was strongly defended as late as 1412 by Prosdocimus de Beldemandis at Padua (*Tractatus practice cantus mensurabilis ad modum ytallicorum*). The system is still used, with modifications, in the Florentine manuscript known as the Squarcialupi Codex (1410–1415).

The first generation of composers of extant songs—Piero, Giovanni da Cascia (Giovanni da Firenze), and Jacopo da Bologna—worked in the 1340s and 1350s at powerful northern Italian courts. References in their works link all three composers first to the court of Luchino Visconti (r. 1339-1349) in Milan, and later to the court of Mastino II della Scala (d. 1351) in Verona, where each man contributed to a cycle of eleven madrigals that hide the *senhal* "Anna." Jacopo's career is the most thoroughly documented from references in his works, and we can

follow him from service to Luchino Visconti, for whom he wrote two motets, to Mastino II and then Alberto della Scala in Verona, where he met Petrarch and set the madrigal *Non al suo amante*, the only work of Petrarch set by a fourteenth-century composer. After the death of Alberto in 1352, Jacopo returned to the Visconti and wrote a triple madrigal (*Aquil' altera/Creatura gentil/Ucel di Dio*) celebrating either the coronation of Emperor Charles IV in 1355 or the marriage of Gian Galeazzo Visconti and Isabella of Valois in 1360. (Gian Galeazzo was known as the conte di Virtù, a name deriving from the county of Vertus in Champagne that he acquired as part of the dowry; two anonymous *istampite* (instrumental dances)—*Virtù* and *Isabella*—may also refer to this marriage.) Most of the more than sixty known works of this earliest generation of composers are two-voice madrigals, though Piero was particularly important in consolidating the *caccia* style. Many of the works continued to be copied in later Tuscan sources, and Simone Prodenzani still referred to works of Giovanni and Jacopo in his *Saporetto* (c. 1415).

Cultivation of *Ars nova* polyphony in Florence was centered in convents and churches, especially San Lorenzo, Santa Trinità, Santa Felicità, and Santo Spirito. The first generation of Florentine composers of extant songs includes Gherardello da Firenze (d. 1362 or 1363), who was active at exactly the same time as the first generation of northerners; Vincenzo da Rimini (Vincenzo da Imola), Lorenzo da Firenze (Lorenzo Masini), and Donato da Cascia, who were slightly older, were active c. 1350–1370. About sixty works are known from this first group of four composers, mostly two-voice madrigals, with a strong representation of influential monophonic *ballate* by Gherardello and Lorenzo, and a handful of *cacce*. Lorenzo, who may have been Landini's teacher at San Lorenzo, set two works by Boccaccio: a *baliata* (*Non so qual i' mi voglia*) and a madrigal (*Come in sul fontefit preso Narciso*). Both Vincenzo and Lorenzo set the madrigal *Ita se n'era a star nel paradiso*, which alludes to Il Paradiso, the villa of the Alberti family at Florence. Gherardello and Lorenzo left a few movements for the mass which apply the madrigal style to sacred music.

The next stage is represented by Niccolò da Perugia and Francesco Landini (c. 1325–1397). Niccolò's work includes, for the first time, a preponderance of two-voice *ballate* (half of some forty works), some on

moralizing texts, many of which are *balla-tae minimae* of the type described by Gidino da Sommacampagna. One of Niccolò's madrigals, *O giustizia regina al mondo nacque*, is attributed to "Giovanni Bocchasi" (possibly Boccaccio) in a text source.

The extraordinary output of Landini— 154 works that make up a full quarter of the entire surviving *Trecento* repertoire— place him in a category of his own. All but fourteen of his works are polyphonic *ballate*, elevating the *ballata*, first two-voice and later three-voice, to a role analogous to that of the contemporary French fixed forms. This decisive shift in emphasis is seen in all the Florentine composers who followed Landini. It is possible that Landini was active in Venice for a time during the 1360s, when he may have written motets for the doges Marco Cornaro (1365-1368) and Andrea Contarini (1368-1382). Villani reports that Pierre de Lusignan, king of the French outpost at Cyprus, gave Landini the *corona laurea* (1362, 1365, or 1368), and the miniature of Landini at the head of his collection in the Squarcialupi Codex depicts him with his laurel wreath. But his professional ties to Florence are attested to as early as 1361. Landini figures prominently in Giovanni Gherardi da Prato's account of Florence set in 1389, *Il Paradiso degli Alberti* (c. 1420). Not only does he sing and play the organetto; he also enters into philosophical and political discussions. A surviving poetic invective against humanist attacks on William of Occam's logic confirms his scholastic training.

Although most of the texts set to music were probably written by the composers themselves, Gherardello, Lorenzo, Donato, Niccolò, and Landini set several texts by known poets, including Franco Sacchetti and Niccolò Soldanieri (some are cited in the *Novelle* of Giovanni Sercambi), and isolated texts by others (Cino Rinuccini, Antonio degli Alberti, Rigo Belondi, and Bindo d'Alesso Donati). Of these, the *ballate*, madrigals, *cacce*, and *canzonette* of Sacchetti are particularly significant because he arranged the texts in chronological order in his *Libra delle rime*, thus providing some valuable chronological anchors to specific ranges of years from 1354 to 1380. It is a revealing commentary on the state of survival of this music that of the thirty-four texts Sacchetti lists with a composer's name, only twelve are extant.

A younger Florentine generation includes Andrea da Firenze (Andrea de' Servi, died c. 1415), Paolo da Firenze (Paolo Tenorista, c. 1355-1436),

and Giovanni Mazzuoli (Jovannes Horganista de Florentia, c. 1360-1426). Andrea, Paolo, and Giovanni Mazzuoli were all closely associated with Landini, Giovanni perhaps as his pupil. Almost all their works are *ballate*; among Paolo's thirteen madrigals is the famous victory madrigal *Godi Firenze*, commemorating the conquest of Pisa by Florence in 1406.

Recent research, based on newly discovered fragmentary manuscripts, careful reexamination of the previously known manuscripts, and meticulous archival work, has begun the difficult task of teasing out the intricate connections that characterize musical culture in northern Italy in the turbulent years around 1400. One important center was at Padua, where Bartolino da Padova (fl. c. 1365-1405) and Johannes Ciconia (c. 1373-1412) were active. Four or five of Bartolino's songs can be associated with political events relating to the ruling Carrara family, and three works antagonistic to the Visconti may indicate a stay in Florence from 1388 to 1390, when that family occupied Padua.

Johannes Ciconia, from Liège, is the most distinguished of the many Netherlanders active in northern Italy in this period. He may have been a pupil of Filippotto de Caserta at Pavia, settling in at the cathedral of Padua from at least 1401 until his death in 1412. Ciconia's output, some of it widely transmitted, includes about twenty secular works (mostly Italian), about ten movements for the mass, and about ten Latin motets, many of them datable political works from the period between 1390 and 1409, honoring, for example, the conciliarist Francesco Zabarella (archpriest of Padua cathedral, law professor at the university, and probably Ciconia's patron) or Michele Steno (doge of Venice, 1400–1413). The work honoring Michele Steno, *Venecie mundi splendor/ Michael qui Stena domus*, acknowledges the Venetians' conquest of Padua. (Enough motets survive honoring Venetian doges—beginning with Francesco Dandolo in 1329—to suggest that such ceremonial motets were well known in Venice throughout the fourteenth century and early fifteenth century.)

The very different milieu at the court of Gian Galeazzo Visconti (r. 1378-1402) in Pavia provides a model of the complex interrelationships of French and Italian culture possible during this period. Gian Galeazzo's close political and dynastic relationship to the French court,

firmly established by his wedding to Isabella of Valois in 1360 and confirmed when his daughter Valentina married Louis of Orléans, brother of King Charles VI, in 1387, was a center for the diffusion through Italy of complex French music of the *ars subtilior*. His library contained a narrative by Guillaume de Machaut and a book of French motets. A manuscript copied at Pavia in 1391 (now at the Newberry Library in Chicago, MS 54.1) contains treatises on music theory attributed to Marchettus of Padua, Johannes de Muris, and Filippotto da Caserta, with an intricate *ars subtilior virelai* by the French composer Jacob de Senleches, *La harpe de mélodie*, copied in a unique musical notation that resembles a harp. A sample of some other works written specifically for Gian Galeazzo include Antonello da Caserta's madrigal *Del glorioso titolo d'esto duce*, perhaps composed for his coronation as duke of Milan in 1395; Bartolino da Padova's madrigal *Alba colomba*, perhaps composed for his entry into Padua in 1388; and Johannes Ciconia's canon *Una panthera in compagnia de Marte*, composed for a visit to Pavia of a Lucchese ambassador in 1399.

It now seems likely that before his service at Padua cathedral, Ciconia was at the Visconti court, possibly from 1390 to 1401. Ciconia's *virelai Sus une fontayne* pays homage to the older composer Filippotto da Caserta by quoting music and text from three of Filippotto's French ballades. Filippotto was an Italian composer who did not cultivate Italian *ars nova* genres at all, preferring the intricate genres with French texts favored at the Visconti court. After the death of Gian Galeazzo in 1402, the main composer at Milan, Matteo da Perugia, also cultivated French forms almost exclusively. His works include about two dozen French *ballades*, *virelais*, and *rondeaux*, and only two Italian *ballate*. From 1402 on, Matteo served Pietro Filargo (Peter Philarges), who was archbishop and, beginning in 1405, cardinal at the then unfinished cathedral of Milan. (Filargo had once taught theology at the Sorbonne but now taught at the University of Pavia, and he had been an adviser to Gian Galeazzo Visconti.) Matteo followed Filargo to Pisa, where the latter was elected Pope Alexander V in 1409; after Filargo's death in 1410, Matteo continued in the service of the antipope John XXIII, finally returning to the cathedral in Milan in 1414.

Antonio Zacara da Teramo (died c. 1413-1415), who lived in Rome from at least 1390 to 1407, served as papal singer and scribe under

popes Boniface IX, Innocent VII, and Gregory XII and was *maestro di cappella* in the chapel of the antipope John XXIII in 1412-1413. Some scholars wonder if Zacara joined the antipope Alexander V in 1409 at Bologna; but since some of his intricate songs in *ars subtilior* style were written for the Visconti, he may have served Giovanni Maria Visconti (r. 1402-1412) at Pavia between 1408 and 1412. Zacara has only recently been recognized as one of the most important and original composers of this period. His works, including about twenty secular pieces and about fifteen settings for the Gloria and Credo, had a very wide geographical distribution.

The French, Netherlandish, and English music known in such northern Italian courts and chapels probably arrived there initially through extensive commercial contacts with the Low Countries, and a significant southward migration began with the Great Schism in 1378. Formerly, clerics in the Low Countries had gone to Paris or Avignon to further their education or careers; now they went to countries that were obedient to Rome, taking their music with them. A typical expression of the facile mixing of Italian and French secular polyphony is seen in a literary source, *Il saporetto* (c. 1415) of Simone Prodenzani of Orvieto. Among a series of forty-eight sonnets devoted to "worldly pleasure" are several celebrating one Sollazzo, a fictional musically talented performer who sings or plays a number of named works on the harp, lute, organ, cembalo, and other instruments. Besides Italian *ars nova* pieces by late composers and known poets (including works of a Sicilian woman), Sollazzo performs a French repertoire of the sort heard at the courts of powerful northern lords and in the private chapels of cardinals and popes, as well as dance tunes from Spain and Germany. Keyboard arrangements of French and Italian songs, along with dance tunes and liturgical pieces—exactly the repertoire performed by Sollazzo—are preserved in the Faenza Codex, a manuscript possibly of Ferrarese provenance (Faenza, Biblioteca Comunale, MS 117).

Of the manuscripts containing music of the Italian *ars nova*, the Rossi Codex is the earliest, preserving music of the first generation of northern composers (Vatican City, Biblioteca Apostolica Vaticana, MS Rossi 215, with additional fragments at Ostiglia, Fondazione Opera Pia don Giuseppe Greggiati, fragment without signature), probably copied for the Scaligeri in Padua and Verona c. 1350. All thirty-seven extant

works in Rossi are transmitted anonymously, although concordances establish that five of them are by Piero or Giovanni da Cascia.

The proud tenacity with which Florentine elite circles held on to the fast-disappearing *ars nova* traditions is seen in the great Squarcialupi Codex. With 352 works, of which 150 are *unica*, it is the largest and most important source for the Italian *ars nova*. On the other hand, the idea of a homogeneous Italian *ars nova* repertoire that the Squarcialupi Codex seems to suggest is illusory. There are four other large Florentine sources: Florence, Biblioteca Nazionale Centrale, MS Panciatichiano 26, a major source for Landini's works which is also strong on music of the first-generation northerners; Paris, Bibliothèque Nationale, MS Fonds Italien 568, important for the later generation of Florentine composers, especially Paolo; London, British Library, MS Additional 29987, the unique source for many monophonic instrumental *istampite*;; and the recently discovered manuscript Florence, Biblioteca Medicea Laurenziana, Archivio Capitolare di San Lorenzo, MS 2211, a palimpsest that once rivaled the Squarcialupi Codex in size, copied c. 1417-1420. (Because of erasure and overwriting in the sixteenth century, most of the works in San Lorenzo 2211, including a collection of Giovanni Mazzuoli's songs, all *unica*, are not recoverable in their entirety.) Unlike the Squarcialupi Codex, all these manuscripts include a fair sampling of French songs, usually added to occupy space left at the bottom of folios after the copying of Italian works.

Several sources preserve a portion of the diverse musical culture of Padua during the late fourteenth century and the early fifteenth. According to current research, Paris, Bibliothèque Nationale, MS Nouvelles Acquisitions Francisques 6771—the so-called Reina Codex—was copied in Venice or Padua, although the repertoire it transmits is very inclusive and does not seem to reflect the tastes of a single court. A large manuscript known as the Lucca Codex or Codex Mancini, also a fragment (Lucca, Archivio di Stato, MS 184; and Perugia, Biblioteca Comunale "Augusta," MS 3065), was probably copied at Padua and reflects the musical tastes of the Carrara, though it also contains some of the repertoire of the Visconti at Milan and Pavia c. 1390-1408. For Padua cathedral and the abbey of Santa Giustina, what was once a large repertoire of motets, music for the mass, and Italian and French songs survives only in several fragments. Given the high foliation

numbers on some of them, these fragments seem to have been parts of large manuscripts, reminding us that important centers in northern Italy remain less known to us simply because of the accidental preservation of more complete Tuscan sources.

Finally, the main corpus of the manuscript Modena, Biblioteca Estense, MSa .M.5.24, reflects the taste of the Pavian-Milanese orbit, and the last section of this manuscript contains a repertoire from the chapel of the antipope Alexander V at Bologna. The Modena manuscript, important for the French *ars subtilior* style, is the unique source for works of Matteo da Perugia.

It should be clear by now that the term *ars nova* is no longer very useful in discussing the local musical culture of late fourteenth- and early fifteenth-century Italy. The movement effectively ends with the Council of Constance (1414-1418), which brought together hundreds of musicians from all over Europe in the retinues of ecclesiastical and secular princes. After the council, many musicians continued the southward migration that had begun during the schism of 1378. Among them were the young Guillaume Du Fay of Cambrai, who followed the Malatesta entourage to Italy and played a crucial role in the merging of the French and Italian musical traditions. Later in the century more northerners joined an expanding papal chapel, as well as the important courts of King Alfonso I of Aragon at Naples, Leonello and Ercole I d'Este at Ferrara, and Galeazzo Maria Sforza at Milan. Northern practices in music were also encouraged by the Medici in Florence. The French notation and French forms brought by the northerners put increased pressure on indigenous art music; and although Italian polyphonic art music exerted some influence on the foreign composers, it soon disappeared. Fifteenth-century Italian humanists preferred simpler oral traditions to the earlier scholastic polyphonic techniques and notation, and the Venetian nobleman Leonardo Giustiniani (c. 1390-1446) popularized simple songs, *giustiniane*, in dialect (the music of this improvised art is of course lost). The next important body of Italian music that survives is the *frottola* repertoire, cultivated at Mantua under the patronage of Isabella d'Este and printed by Petrucci in Venice in the first years of the sixteenth century.

Arthurian Material in Italy

The term "matter of Britain" refers to a group of narratives that were originally independent but became fused in literary tradition by virtue of their British setting and themes: the adventures of the legendary King Arthur and his knights of the Round Table, the quest for the Holy Grail, the downfall of Camelot, and the two pairs of lovers Lancelot and Gueneviere and Tristan and Isolde. Scholars generally agree that the story of Tristan developed in Wales from the ninth to the twelfth centuries and identify Geoffrey of Monmouth's *Historia regum Britanniae* (c. 1136) as the earliest written source for the vernacular Arthurian cycle.

These powerful narratives circulated throughout Europe, serving as popular entertainments in oral performance as well as favorite reading matter for newly literate laymen and laywomen. The tales were transmitted by troubadours and other travelers from France and Provence—where literary forms in the vernacular had already developed—to the Sicilian court of Frederick II and into northern Italy.

Nonliterary and extratextual evidence proves that this material was already being widely diffused in the twelfth century: Arthurian characters decorate the cathedrals at Modena, Otranto, and Bari; the names of Arthurian heroes were included in onomastics; and there are references or allusions to these characters by early poets like Giacomo da Lentini and Guittone d'Arezzo, in early narratives like *Il novellino* and *I conti di antichi cavalieri*, in didactic poems like *Intelligenza* and Fazio degli Uberti's *Dittamondo*, and even by Saint Francis. French romances were copied at Naples in the late thirteenth century. In the

Divine Comedy, Dante refers to the prose *Lancelot* (in a famous passage in *Inferno* 5) and to the vulgate *Mart Artu* (in *Inferno* 32). He also refers to an episode from *Lancelot* in *Convivio* and praises the text in *De vulgari eloquentia*. In the mid-fourteenth century, Petrarch (in *Trionfo d'amore*) and Boccaccio (in *Decameron*) refer explicitly to Arthurian romances.

As literacy spread in Italy because of intense urbanization and commercial activities, the demand for reading matter was met not only by original compositions in Italian but also by *volgarizzamenti*, texts translated from other languages. Modern literary critics tend to dismiss the *volgarizzamenti* as imitations, but the process by which they were created must be understood not in the modern sense of literal translation but rather in the medieval sense of freely reshaping and reordering preexisting material, and even innovating, according to the tastes and norms of a particular author or audience. Although Old French sources for episodes and characters can be identified, such elements were elided, omitted, and combined in new ways to produce, in effect, a new text.

Several anonymous Arthurian romances in various dialects have

survived in fourteenth-century manuscripts. Three of them—*Tristano Riccardiano* (considered the earliest Arthurian text copied in Italian), *Tristano Panciatichiano*, and *Tristano Corsiniano*—are named for the collections where the manuscripts are conserved; and one, *Tristano Veneto*, is named for its dialect. Other such manuscripts are *La tavola ritonda* (*The Round Table*), *La storia di Merlino* (attributed to the Florentine chronicler Paolino Pieri), and *Palamedes* (also called *Girone il cortese*). Fragments and book inventories that are now coming to light testify to the widespread popularity of this literature in Italy.

Focal episodes from the Arthurian romances were set in verse in fourteenth- and fifteenth-century *cantari*: *Febusso e Breusso* retells an episode in *Palamedes*; *La pulzella Gaia* deals with the love of Morgan's daughter for Gawain; and *Carduino* contains material from the *enfances* of Perceval and the adventures of Guinglain. (*Enfances* are a medieval genre in which the legend of a hero is completed by recounting his childhood or origins.) The Florentine poet Antonio Pucci (1318-1388) composed a *canzone* about Gawain as well as two *cantari* about Gismirante. Other *cantari* based on the prose *Tristan* and the vulgate *Mort Artu* are *La morte di Tristano*, *La vendetta che fe meser Lanzelloto de la morte di meser Tristano* (*The Revenge of Lancelot for the Death of Tristan*), *Tristano e Lancielotto*, and *Lancellotto*.

In fifteenth-century Tuscany, the "matter of France" eventually overshadowed the "matter of Britain," but surviving library inventories of the house of Savoy, the Este at Ferrara, the Gonzaga at Mantua, and the Visconti and Sforza at Milan prove that the Arthurian romances remained important. The story of Tristan was apparently more popular in Tuscany than that of Lancelot; but in the north manuscripts of *Lancelot* were copied and read in the original French, and there were other versions in Franco-Italian dialect and a few in local vernaculars. Social differences may explain the readers' differing tastes: bourgeois entrepreneurs in Florence were drawn to the combative exploits of autonomous warrior heroes while the more feudal northern cities preserved the courtly literature they had inherited from France. Thus the several popular prose narratives by the Florentine Andrea da Barberino and others shunned the adulterous love themes of Arthurian literature and restored the knight-errant as a defender of family and *patria*, whereas the Ferrarese poet Boiardo, and later Ariosto,

nostalgically fused the love theme with the tale of the warrior hero Orlando in an unprecedented intermingling of the two "matters."

Ascoli Piceno

Ascoli Piceno, the ancient Roman Asculum, is in the region of the Marches (Marche), at the confluence of the Tronto and Castellano rivers, on the east side of the Apennines in an alluvial plain. It has been inhabited since the Iron Age. Ascoli became a Roman colony in 286 B.C., and many remains of Roman structures survive: the late republican Gemina gate, parts of the Augustan theater and of several temples, and two bridges—the Solesta over the Tronto and the Cecco over the Castellano. Pompeo Strabo spoke of its streets as *strade breve*, to suggest its small size. Ascoli was mentioned by Julius Caesar in *De bello civile* (*On Civil War*), by Cicero in *Pro Sulla* (*Oration for Sulla*), and by Paul the Deacon in *Historia Longobarda* (*Lombard History*). The city was taken by Caesar during the civil wars and became an

important market for several centuries. In the Roman era, as now, the region produced cereals, wine, fruit, olives, honey, and silk. Christianity was introduced to Ascoli in the fourth century by Saint Emidius, and the town was for a while the seat of a bishop. In 544, Ascoli was occupied by the Goths under Totila (Procopius, *De bello gothicum*, 3.2). In 578, it was seized by the Lombards, who controlled it for almost two hundred years until it passed to the church in 774. In the mid-ninth century, it twice repelled attacks by Saracens, and by 1185 it had become a free commune. Frederick II conquered it in 1242 and granted it free institutions and privileges; these were respected even after Ascoli returned to the control of the church upon the death of Manfred in 1267. There were several episodes of seigneurial rule, such as that of Galeotto Malatesta (1349-1356).

In addition to its Roman remains, Ascoli preserves a number of Romanesque churches in the Lombard style. For example, the twelfth-century octagonal baptistery has a characteristic blind arcade adorning the surface of each exterior wall. Other Romanesque churches from this period include San Vittore, which has Byzantine frescoes; Santa Maria inter Vineas, with its beautiful thirteenth-century bell tower; Sant' Angelo Magno (1292); San Gregorio; Santi Vincenzo e Anastasio; San Tommaso; and San Venanzio. The civic buildings include the imposing Palazzo Comunale (late twelfth century) and the Palazzo del Capitano del Popolo (thirteenth century).

Ascoli Piceno's large Gothic church, San Francesco, was begun in 1258 and consecrated in 1371. With its octagonal piers, it reflects the plan of the cathedrals of Florence and Siena. The Gothic arches of the nave rest on octagonal columns, and double *trifora* designed by the Embriachi of the late fourteenth century appear in the clerestory above the nave. Other churches begun in the fourteenth century but completed later are Sant' Agostino (1317), Saint Peter Martyr (1332),

and San Giacomo. A fortress constructed by Galeotto Malatesta in 1349 was rebuilt in the sixteenth century by Antonio Sangallo the Younger for Pope Paul III.

Among Ascoli's notable citizens during the late Middle Ages are Pope Nicholas IV (1288-1292); the poet and astrologer Cecco d'Ascoli (Francesco Stabili, 1269-1327), who was burned as a heretic in Florence; and the fifteenth-century humanist Enoch d'Ascoli.

Assisi, a city on the lower slope of Monte Subasio, today has a population of about 25,000. It is part of the province of Perugia and the region of Umbria. Despite its small size and somewhat isolated location, it is one of the sites in Italy most frequently visited, especially by pilgrims who come to venerate Saint Francis and Saint Clare and by tourists who come to see the basilica of San Francesco, which contains the world's greatest collection of late medieval and early Renaissance painting.

Assisi was the Roman town Assisium, incorporated into the republic c. 300 B.C. Its most famous citizen in ancient times was the poet Propertius. It still has visible Roman remains, most notably the front of what is called the temple of Minerva, which greatly impressed Goethe when he visited the city in 1786, in the Piazza Comunale. In ancient Assisi, when the piazza was much lower, a flight of steps led up to this grand building. The original forum has been excavated and can be visited; it is literally a walk under the present piazza. Other ancient remains in Assisi include the outline of its amphitheater.

Christianity came to Assisi perhaps in the third century after Christ, and by tradition its first missionary and martyr was Saint Rufinus (San Rufino), to whom the cathedral of Assisi is dedicated. Little is known about Rufinus, or about the other early martyrs; written accounts of their lives date from several centuries later and are historically unreliable. There is better evidence for evangelization in the area by Saint Felician, who became a victim of the persecution by Emperor Decius c. 250.

There is documentary evidence that an episcopal see was established in Assisi by 545; that year, the Gothic king Totila sent the bishop on a diplomatic mission after having taken the city, which had been garrisoned by a Byzantine army. Assisi eventually became a part of the duchy of Spoleto when the Germanic Lombard tribe captured the region from Byzantium shortly after 568. Occasionally, the name of a bishop survives in the papal archives, but otherwise we know almost nothing about the development of the town during the Lombard period. Although the Lombards submitted to the Franks and Assisi came under Charlemagne's control, we have almost no information about specific events in Assisi; however, there is a legend—recorded much later—that Charlemagne personally conducted the siege which led to the city's

surrender to him.

The ninth and tenth centuries are as "dark" for Assisi as for much of the rest of Europe. Muslim and Magyar raiding parties entered Umbria, but we do not know whether they ever attacked Assisi. A few records survive concerning the local bishops, but these have to do with land and give us little insight into the city's development. Still, it does appear

that the bishops were involved in the defense of some of the lands of their dependents. The crypt of the church of Santa Maria dates from this period; it is the oldest Christian structure in Assisi.

As we look at the increasing documentary evidence from 1000 to 1200, we find a succession of conflicts: some common to many other Italian towns of the time, others peculiar to Assisi. The most important of those that were unique to Assisi was a struggle over which church would serve as its cathedral. Ultimately, San Rufino replaced Santa Maria as the cathedral—a triumph for the canons and the old feudal nobility over the bishop.

As noted above, Assisi was a part of the duchy of Spoleto, a territory that had been long governed, at least indirectly, by the Holy Roman emperors in Germany. However, the papacy claimed that the area had been "donated" to the church by previous emperors. At the end of the twelfth century, the question whether Assisi came under the Holy Roman empire or the church had serious consequences, because Emperor Frederick Barbarossa (1152-1190) and the popes who were his contemporaries were usually at odds. In 1198, people from Assisi stormed the powerful fortress above the city, La Rocca; they expelled the German soldiers and then destroyed it. However, Assisi was not about to trade one master for another, and the city sought to establish

its independence, at least de facto.

Being an object of dispute between two superpowers was not Assisi's only problem. It was also involved in a sharp rivalry with Perugia, a larger city just a few kilometers away. In 1202, Assisi and Perugia fought for control of some of the small towns and farmland between them, and Perugia was the victor.

There were also numerous conflicts within Assisi. Serious tension existed between the bishop, who was the spiritual head of the city and also a great landholder, and the local secular lords. Furthermore, there was conflict between those wealthy landed aristocrats and the town's increasingly wealthy merchants. Some of the various conflicts were not fully separate from one another. For example, it was the *comune* of Assisi, a group of leading townspeople, who destroyed La Rocca in 1198, and several powerful aristocratic families were exiled to Perugia. As the *comune* took charge of Assisi in the early thirteenth century, it came into conflict with the bishop.

In the midst of all of this tension and change, the city's most famous native, Francis of Assisi, was born in 1181 or 1182. He may have taken part in the destruction of La Rocca when he was sixteen; and he fought for Assisi against Perugia in 1202 and was taken as a prisoner of war. He briefly joined a military recruiter who was organizing an army to fight the German ruler of Sicily. At the end of his life he wrote a song for the purpose of bringing peace between the bishop and the leader of the *comune*.

Assisi was never one of the largest or most important cities in central Italy, although it did have some international merchants, including the father of Francis of Assisi. It was not able to defend itself in the long run against Perugia. And as the papacy aggressively asserted control over the papal states, Assisi was essentially absorbed into that larger political entity. During the fourteenth century, when the church was struggling to keep control of the papal states while the popes were living in Avignon, Cardinal Albornoz reconstructed La Rocca above Assisi. It still stands as a reminder of Assisi's place in the papal states. Assisi's political history from the fourteenth century to the present is a chapter in the history of the papal states and then in that of the nation of Italy.

Though Assisi was not a major economic or political force, even in

Umbria, it developed an importance out of all proportion to its size by being the birthplace and, even more significantly, the burial place of two of the greatest saints in the Catholic church: Saint Francis (or Francesco) and Saint Clare (Chiara). Francis died in 1226 and was canonized in 1228, the same year that pope Gregory IX laid the cornerstone for the church in which Francis is buried, the basilica of San Francesco at the western end of the city. Pilgrims flocked to visit the tomb of Saint Francis, and the friars and their patrons hired many of the greatest artists from Italy and from beyond the Alps to decorate the basilica. The stained-glass windows were made largely by French and German craftsmen, and the walls were decorated by a "who's who" of thirteenth- and fourteenth-century Italian painters including Giunta Pisano, Cimabue, Jacopo Torriti, Giotto, Simone Martini, and Pietro Lorenzetti. Near the eastern end of Assisi is the somewhat smaller basilica of Santa Chiara, begun almost immediately after her death in 1253. Seven hundred fifty years later, the city is still crowded with pilgrims and with visitors who come to see these churches.

Assisi remained an important place in the twentieth century. During World War II, thanks largely to its mayor, Arnaldo Fortini, the city was saved from destruction; and it also was the center of an underground that protected Jews from persecution. John Paul II, who became pope in 1978, once called for the world's religious leaders to come to Assisi for a day of prayer; he was joined there by the Dalai Lama, the archbishop of Canterbury, and leaders of many religious traditions including a Native American of the Crow nation in Montana. Such a gathering could not, perhaps, have taken place anywhere else but the city where Saint Francis had embraced lepers and preached to birds.

There are no books in English that provide a straightforward history of Assisi, but most books about the lives of Saint Francis and Saint Clare contain some historical setting. By far the best source for learning about Assisi is Fortini's *Francis of Assisi* (1981). Fortini was mayor of Assisi for many years and knew the documentary evidence for the city's history better than anyone else. It has been suggested that his book really should be titled *Francis and Assisi*, since the city is as important to the author as the saint. Two other books that are ultimately concerned with Francis of Assisi also contain a great deal of information about the city. The more accessible of the two is Brown

(1982). The second, which is also valuable, is a collection of essays: *Assisi al tempo di San Francesco* (*Assisi in the Time of Saint Francis*, 1978). Although Assisi was not one of the most important cities to develop in Italy in the Middle Ages, it is included in books that deal with the medieval city-republics. A rather concise example is Waley (1988); a more thorough but perhaps less readable account is Jones (1997).

Asti

Asti is a town in the region of Piedmont, on the Tanaro River and along an ancient Roman road, the Via Fulvia. The ancient name of the community is pre-Roman and is found in inscriptions as Asta; Pliny (in *Natural History*, 3.49) records the name as Hasta Pompeia. The Roman settlement dates from the second century B.C. During the later years of the Roman empire, in the fifth century after Christ, it was attacked by

Alaric. According to one tradition, Saint Siro was the first bishop of Asti, in the mid-first century; but other traditions suggest a certain Saint Evasio, in the third century. The first documented evidence for the bishopric dates from the fifth century. The city suffered invasions by the barbarians and came under the control of the Ostrogoths, who gave it a certain importance. Under the Lombards, in November 596, it became a duchy. Duke Aribert ruled there before he was chosen king. Under the Franks, it was the seat of a lineage of counts, of whom the best-known is Suppone (d. 887). In the tenth and eleventh centuries, the archbishops were recognized by the German emperors as civic leaders who exercised comital authority in the city (i.e., authority ranking with that of a count). However, by the end of the eleventh century the commune was beginning to challenge the bishops' authority. As a result of its defiance of Emperor Frederick I Barbarossa, Asti was destroyed in 1155; but four years later, in 1159, the emperor was forced to recognize its autonomy. In 1168, in an attempt to escape the hegemony of the marquis of Montferrat, the commune allied itself with the Lombard league; after an attack by Frederick I in 1174, however, it returned to the imperial side. This status was confirmed by the Peace of Constance in 1183.

Despite the factional struggles in subsequent years, Asti, which had an advantageous geographic location, became a center of commerce and banking. During this period it was one of the wealthiest cities in Piedmont, and its merchants and bankers were actively involved in commerce with France and Flanders, to such an extent that it competed favorably with economic centers such as Milan, Piacenza, Florence, Siena, and Lucca. In the second half of the thirteenth century the city was one of the staunchest opponents of the ambitions of Charles of Anjou. In 1275, Asti, in alliance with Genoa, Pavia, and the marquisate of Montferrat, won a decisive military victory at Roccavione. At the end of the thirteenth century and the beginning of the fourteenth, internal strife between Guelf and Ghibelline families—respectively, the Solaro and the de Castello—prepared the way for a number of overlords such as the prince of Acaia; Henry VII of Luxembourg; Robert of Anjou; the house of Savoy; and the Visconti family of Milan. In 1387, when Valentina, daughter of Gian Galeazzo Visconti, married Louis of Orleans, Asti became part of her dowry. In this connection, the city

became one strand of the interests that drew the French royal family into Italian affairs during the late Middle Ages.

While Asti still retains some traces of its Roman and medieval buildings, its most important religious and private structures date from the late medieval and postmedieval periods. The Romanesque-Gothic Collegiata di San Secondo (thirteenth-fifteenth centuries), the crypt of Saint Anastasius, the Baptistry of Saint Peter (twelfth century), and the cathedral—which was begun in the fourteenth century and is in the Piedmontese Gothic style—have undergone significant renovations. A number of fine public and private palaces from the thirteenth through the fifteenth centuries survive.

Astrology

Astrology is the divination of the supposed influence exerted on human affairs and earthly events by the stars, and especially by six of the other planets. This modern definition distinguishes astrology from astronomy, the scientific study of the universe outside the earth's atmosphere; but before the seventeenth century the two terms were often used indifferently to designate the study of the stars, which at that time might embrace both pursuits. Although astrology is a pseudoscience, at

least some of its practitioners did, like astronomers, apply a high level of mathematical skill. The Greeks found such studies already well advanced in Egypt and Mesopotamia; borrowing selectively, they developed their own system, which was definitively formulated c. A.D. 150 by Ptolemy in his *Almagest* (on astronomy) and *Tetrabiblos* (or *Quadripartitum*, on astrology). Educated Romans, who were bilingual, never bothered to translate these technical works into Latin but studied them in the original Greek. To be sure, Latin authors wrote about the nonmathematical aspects of the study of stars, but their works were addressed to a nonprofessional audience who approached *astronomia-astrologia* as one of the seven liberal arts. Even the most detailed Latin treatise on astrology—*Mathesis*, by Julius Firmicus Maternus of Syracuse (fl. c. 335)—failed to explain how to cast a horoscope. Consequently, after the knowledge of Greek died out in Italy in the 500s, no one in the Latin west was able to practice astrology on its own terms until the twelfth century, when the relevant manuals of geometry and astronomy were finally translated into Latin.

The church fathers disapproved of astrology because it seemed to deny man's free will, but they felt that they could not dismiss it as the work of demons as they dismissed most pagan magic. Their reasoning was that astrology had been considered simply a natural phenomenon in Greek science, and also that it was authorized by the biblical story of the three Magi, to whom a star announced the birth of Christ. The Latin fathers favored a solution proposed by Tertullian (c. 200): although astrology was natural, it was no longer licit after the birth of Christ. Calcidius, a Christian Neoplatonist (c. 394, possibly at Milan), purportedly resolved the issue by limiting the effects of the stars to the human body, leaving the mind and will free. Augustine (d. 431) went further, denying the efficacy of astrology altogether; his (sound) argument was that twins often differ in character and fortune.

For various reasons, the founders of the liberal arts curriculum tended to exclude astrology. Martianus Capella (fl. 410-439) considered the casting of horoscopes an art but not a liberal art; Cassiodorus (died c. 483) considered it contrary to the Christian faith and hence something that should not be studied by monks. Consequently, astrology had no place in the Latin monastic culture of subsequent centuries. It was deplored by Isidore of Seville (d. 636) and ignored by

Bede (d. 735), and it played no part in the Carolingian Renaissance. When Gerbert of Aurillac (later Pope Sylvester II), who was reputed to be a magician, visited Rome in 970, he found that astronomy was "almost completely unknown in Italy," and what little equipment he had brought with him from Spain was inadequate to do astrology. It would seem that in rejecting astrology, western Europe was simply making a virtue of necessity, since it had no access to the information that was needed to cast even a simple horoscope.

Meanwhile, astrology flourished in the east; and beginning c. 800 it was assimilated, refined, and expanded by the Muslims, who translated the key works of Greek science into Arabic. By 1000, the sophisticated Arabic astrology was well known to the Muslim neighbors of Catholic Europe in Sicily and Spain. Christian scholars were eager to improve their knowledge of the quadrivium, but the opportunity came only after the reconquest of significant centers of Muslim culture—Palermo in 1072, Toledo in 1085. In the course of the twelfth century, the greater part of Greek science was translated from Arabic into Latin, including the works of some three dozen Hellenistic and Muslim authorities on astrology and astronomy. Most of the translations were done in Spain, especially at Toledo under the patronage of the local archbishop. Scholars flocked to Spain from every part of Europe to do the translations; these scholars included two Italians. Gerard of Cremona (1114-1187) was the most prolific translator; at Toledo he translated Ptolemy's *Almagest* as well as many other mathematical, medical, and philosophical works, including six astrological treatises. Plato of Tivoli, working in Barcelona (c. 1134-1145), specialized in astrology; he translated eleven works, most notably Ptolemy's astrological textbook *Tetrabiblos*. By 1200, Greek and Arabic astrology was at the disposal of the Latin west.

Before native Italians had mastered the new doctrines, a wandering scholar from Spain, Rabbi Abraham Ibn Ezra, composed an important manual of astrology at Lucca in 1148. From 1140 to 1161, he visited a series of Jewish communities in Italy, France, and England. For his hosts, he wrote many biblical commentaries and a few secular treatises, including the *Beginning of Wisdom*, which presented the basics of Arab astrology. This treatise was translated into French in 1273, and the French version was translated into Latin twice—first by Henry Bate at

the papal curia in Orvieto in 1292 and then by Peter of Abano at Padua in 1293.

In the thirteenth century, the University of Bologna became a center for astrology. In 1220, it attracted Michael Scot from Spain, where he had been translating from the Arabic. Frederick II and his enemies, the cities of the Lombard league, sought Scot's advice as an astrologer. Michael dedicated to the emperor an enormous introduction to astrology, describing how to read "astrological character" from physiognomy and other traits. After Scot's death in 1235, Frederick's chief astrologer was Theodore of Antioch; but on one occasion Frederick was advised by Italy's first great native astrologer, Guido Bonatti of Forlì (c. 1210-c. 1297). After studying medicine and astrology at Bologna, Bonatti practiced both arts at Forlì and occasionally advised Ghibellines and Ghibelline powers, such as Ezzelino da Romano, Guido Novello, the commune of Florence (1259-1261), and Guido da Montefeltro (1275-1283). Bonatti's massive *Liber astronomicus*—a veritable *summa* of astrology—became the standard Latin introduction to the subject, being somewhat shorter than Scot's and more traditional in approach.

Christians, of course, could not believe that the stars deprived man of his free will, so extreme astrological determinism was deemed heretical (e.g., by the bishop of Paris in 1277). But scholastics steeped in Greek philosophy had to admit that astral influence was a natural, "scientific" phenomenon. Thus Albertus Magnus (d. 1280) wrote a *Speculum astronomiae* (*Mirror of Astronomy*) in which he distinguished between licit and illicit astrology; he was confident that the will could not be bound by the stars, and he defended astrology as a natural science, while condemning its magical applications in demonolatry, necromancy, and divination. His pupil Thomas Aquinas (d. 1274) was more guarded, allowing that the stars could influence the human body but not the mind. Thus the Inquisition had reason to consider the more extreme claims of astrology heretical, though accusations were few and condemnations rare. The Inquisition was investigating certain astrological opinions of Peter of Abano when he died (c. 1316), but it is unknown which ones were objectionable and it is doubtful that he was ever condemned. Cecco d'Ascoli certainly was burned at the stake in 1327, ostensibly for contumaciously continuing to teach extreme astral

fatalism, but this may well have been a convenient pretext seized on by his enemies (as with Joan of Arc). Neither case discouraged Italians from studying astrology, which flourished as never before during the next generation.

Peter of Abano was the most original astrologer of the Latin Middle Ages. After studying in Constantinople and Paris, he returned to teach at Padua. His masterwork is the *Conciliator* (1310), in which he discusses and resolves with astonishing erudition some 200 scholastic questions, mostly medical but often involving astrology: e.g., "Whether a doctor today can help the sick by his knowledge of astronomy." Peter argued that the conjunction of Jupiter and Saturn in the first degree of Aries produces great prophets, such as Christ and Moses, and that human history is cyclical, being governed by each of the seven planets in turn for a period of about 354 years. His achievement was a magisterial synthesis of scholastic philosophy and medicine, in which astrology was seen as the controlling force of nature.

The learning of Cecco d'Ascoli was merely commonplace, however high an opinion he had of himself. His lectures at Bologna included an astrological rationale of the life of Christ but otherwise were conventional enough. He was, however, the first to write in Italian about astrology, in *L'acerba*, a rambling, obscure encyclopedic poem with satiric asides—directed, for example, against Dante—and with a strong admixture of folklore and magic.

By the fourteenth century, astrology was an accepted part of Italian cultural life. Dante believed that "it is without doubt within the capacity of human understanding to comprehend the mover of the heaven, and his will, through the motion thereof" (*Epistle* 5.8). Accordingly, Dante's *Comedy* teems with astrological allusions, especially in the planetary heavens of the *Paradiso*. Petrarch was ambivalent about astrology, as he was about medicine and much else. Although he befriended astrologers, praised their accuracy, and often took astrology for granted, still on occasion he could be skeptical and wary of charlatans. Boccaccio lavished fulsome praise on the Genoese astrologer Andalò di Negro, under whom he studied at Naples in the 1330s.

Astrology was cultivated intensively throughout Europe in the fourteenth century, and Italy was no exception. Boccaccio's teacher,

Andalò di Negro (died c. 1340), wrote a short introduction to judicial astrology as well as several treatises on how the stars affect procreation. Two Italian friars wrote on medical astrology. One, a Dominican named Niccolò di Paganica, who was born near Aquila in the Abruzzi, compiled a brief summary of astrological medicine in 1330, which he rededicated to the Visconti ruler of Bologna in the 1350s; Petrarch's copy of this work survives in Venice. The other friar, Augustine of Trent, a native of Brescia, was an Augustinian who taught at Perugia and was chaplain to the bishop of Trent. In 1340, he composed an astrological explanation of the plague that was then raging, well before the black death of 1348. Other, less distinguished Italian astrological authors of the period include Master Romano, a physician of Rome (c. 1300) who summarized the ways in which a planet's influence could be modified; Thaddeus of Parma, who drew up a bibliography and classification of astrology and the occult arts for his students at Bologna in 1318; and Paolo Dagomari of Prato, who included rules for making astrological calculations in his *Trattato d'abbaco* (*Treatise on the Abacus*, Florence, 1339).

The proliferation of astrology in medieval Italy depended on two conditions: first, the availability of suitable textbooks, which were provided by the twelfth-century translators; and second, the systematic exposition of these texts in the universities. Although Bologna seems to have been a center for astrological studies from the days of Scot and Bonatti onward, the details of the curriculum were first set down in the university statutes of 1404. By then, astrology was an independent four-year degree program on a par with philosophy and medicine. The curriculum included arithmetic, Euclid's *Geometry*, and astronomy, with special stress on the use of tables of planetary positions; the chief astrological texts were Alcabkius's *Introduction* and Ptolemy's *Quadripartium* (*Tetrabiblos*) and *Centiloquium*. Once established, academic astrology enjoyed a long life. As late as 1799, the university statutes at Bologna required the professor of astronomy to draw up an annual almanac for medical use.

Ataulf

Ataulf (Ataulphus, Atawulf, Aistaulf; d. 415) was king of the Visigoths from 410 to 415, having succeeded his brother-in-law Alaric. After the death of Alaric and during the movement of the Visigoths through Italy, Ataulf led them in their continuing march northward—eventually, out of Italy into Provence and Aquitaine, taking advantage of the discord among Roman governors in the region. He obtained the recognition of the western emperor Honorius to establish his people ostensibly under the authority of Rome, but in fact as an independent regime ultimately focused in Spain, the first of the eventual Germanic successor states in the west. His ties to the imperial regime were strengthened by his

marriage to Honorius's sister Galla Placidia at Narbonne in 412. He was assassinated by his political opponents in Barcelona.

Attila the Hun

The Huns appear to have been related to the Hsiung-Nu, a Turkish-Mongolian people who are mentioned in Chinese records of the early centuries after Christ. They eventually made their way across central Asia, and they acquired a fearsome reputation as savage warriors who lived mainly on horseback. Around a.d. 370, the Huns halted their advance north of the Danube River. For a time their relations with the Romans were like those of other barbarians, and they often served as auxiliaries in the Roman army. In the fifth century, however, they once again grew restive. In the early 420s, the Hun king Rua had to be bought off by the Romans with a subsidy of 350 pounds of gold per year.

Attila. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 137v.

In the late 430s, Rua's sons Attila (c. 435-453) and Bleda succeeded to the throne. Around 445, Attila murdered his brother and became sole king. He imposed increasingly severe terms on the eastern Roman emperor Theodosius II (402-450), raising the yearly subsidy first to 700 pounds of gold and then to 2,100. In 447, the Romans even agreed to evacuate a strip south of the Danube five days' march wide.

Subsequently, Attila's interests seem to have turned toward the west, and to the princess Justa Grata Honoria, elder sister of the western emperor Valentinian III (425-455). Around 449, she had been apprehended in an illicit love affair and exiled to Constantinople. She then sent her ring to Attila and appealed to him for help. At this, Theodosius II, who already had enough problems with the Huns, immediately dispatched her back to Italy—with the recommendation

that Valentinian turn her over to Attila.

Valentinian refused, and what happened next is described by the historian Priscus, who had visited Attila's camp in 448. According to Priscus, Attila:

... sent men to the ruler of the western Romans to argue that Honoria, whom he had pledged to himself in marriage, should in no way be harmed. ... He sent also to the eastern Romans concerning the appointed tribute, but his ambassadors returned from both missions with nothing accomplished. . . . Attila was of two minds and at a loss which he should attack first, but finally it seemed better to him to enter on the greater war and to march against the west, since his fight there would be not only against the Italians but also against the Goths and Franks. . . . He sent certain men of his court to Italy that the Romans might surrender Honoria. ... He also said that Valentinian should withdraw from half of the empire. . . . When the western Romans held their former opinion, he devoted himself eagerly to preparation for war.

When Attila led the Huns and their subject peoples across the Rhine into Gaul in 451, the situation looked bleak for the Romans. The Roman army then consisted of little more than barbarian mercenaries in the personal service of Flavius Aetius, a "patrician and master of soldiers" (field marshal), who had once been a hostage of Attila's and who had skillfully played one barbarian group off against another for twenty-five years. The other powers in western Europe—the Visigoths in Aquitania and the Franks in the Rhineland—decided that they had more to fear from the Huns than from the Romans, and Aetius became the leader of an unlikely coalition of Visigoths, Franks, and what remained of the Roman army.

The Gallic chronicler Prosper, writing a few years later, noted, "Once the Rhine had been crossed, many Gallic cities experienced Attila's most savage attacks." In the next century, Gregory of Tours related that after destroying Metz, the Huns "ravaged a great number of other cities" before finally attacking Orleans, which was strongly defended. Unable to take Orleans, Attila began a strategic retreat northward. In July, it seems, between Troyes and Chalons-sur-Marne (ancient Catalauni), Attila was brought to battle on the Mauriac plain (the modern Mery-sur-Seine), about 20 miles (32 kilometers) northwest of Troyes, 35 miles (56 kilometers) south of Chalons, and next to the so-

called Catalaunian fields.

According to the sixth-century Gothic historian Jordanes, there ensued "a battle ghastly, confused, ferocious, and unrelenting, the like of which history has never recounted." In the melee, the aged Visigothic king, Theoderic, was thrown from his horse and trampled to death by his own men, and Attila was nearly slain. The Huns then retreated to their camp, which had been fortified by their encircled wagons. On the following day, neither side felt strong enough to resume the battle; it was later said that 165,000 men had been slain. While the members of the Roman coalition debated what to do next, Attila is said to have stood atop a funeral pyre threatening to immolate himself rather than be taken captive. Neither Attila nor Aetius was in any condition to carry on the fight. Attila withdrew back across the Rhine.

However, Attila returned the next year and passed through the inexplicably undefended Alps into Italy. His forces destroyed Aquileia and captured Milan. Then, according to a pious legend, the Huns were induced to withdraw by an embassy of Pope Leo I, who was assisted in his efforts by apparitions of saints Peter and Paul. Disease, starvation, and the rumored arrival of reinforcements from the east also would have influenced the Huns' decision.

In 453, on his wedding night, Attila died. In 454 the subject peoples of the Huns revolted, inflicting a disastrous defeat upon their erstwhile masters in the battle of the Nedao River. The Huns never again posed a serious threat to the Roman empire, although the western empire soon succumbed to the encroachments of other barbarians who were neither as savage nor as feared as the Huns had been.

Attila himself subsequently developed a reputation as the epitome of the barbarian. Christian moralists referred to him as the "scourge of God" for his perceived role in punishing sinful Christians. In modern times, it has been suggested that a victory by the Huns would have caused irreparable damage, jeopardizing the future of western civilization. The defeat of Attila's invasion of Gaul has been portrayed as a victory of civilization over barbarism, and a turning point in history.

Augustine, Saint

Augustine (354-430), bishop of Hippo in Roman Africa from 396 to 430, was the predominant force behind the development of the western church in his time. Because of his eloquent defense and interpretation of church doctrine, he is generally considered the preeminent intellect of Christian antiquity. The theology he developed, which melded the scriptures of the New Testament with the Platonic ideas of Greek philosophy, had a profound effect on Christianity during the Middle Ages and the Renaissance and remains a powerful influence today.

Augustine's *Confessions*, the autobiographical account of his first thirty-three years, contains most of what we know about his early life. He was born on 13 November 354 in Thagaste in North Africa. His father, Patricius, was a pagan and remained so until just before dying; but his mother, Monica, was a devout Christian. Although Augustine was not baptized as an infant, his early education included Monica's lessons on Christianity. When he was about sixteen, his parents sent him to Carthage to be educated further. During his time in Carthage, he took a mistress, who bore him a son, Adeodatus, in 372. Although he never married her, their relationship lasted fifteen years. In Carthage,

Augustine encountered Cicero's *Hortensius* (now lost), and this work inspired him to study philosophy. His desire for knowledge also led him to explore the scriptures, but to his great disappointment he found them simplistic in content and form. Christianity, he concluded, was for the uneducated and uncultured.

Augustine then turned to Manicheism, when he was nineteen. The

Manichees criticized the contradictions and mysteries of the Christian faith, though they did accept the truth of certain Christian teachings. They focused on the demonic, believing that opposing forces of good and evil, represented by light and dark, were struggling for control over the world. Their use of astrology also fascinated Augustine, and for about ten years he remained a member of this sect.

Augustine started a school of rhetoric at Carthage in 374. Subsequently, he also began to enter—and win—rhetorical contests. His activities in this regard led to a meeting with the proconsul Vindicianus, who was presiding over a contest in which Augustine took first prize. Augustine began to cultivate a friendship with Vindicianus, who encouraged him to give up astrology. In 380, Augustine published his first book, *On the Beautiful and the Fitting*. He began to study astronomy and started to question his Manichean beliefs.

Augustine's confidence in the Manichees continued to decline, not only because of his intellectual doubts about their teaching but also because he began to be critical of the moral delinquency he encountered among them. He closed his school and departed for Rome. He stayed there for a year, and although he was still nominally part of the Manichean community in Rome, his interest in philosophy began to increase. Now twenty-nine years of age, he successfully applied for a position as a professor of rhetoric in Milan.

Augustine's time in Milan would have a profound effect on his religious beliefs, as it was here that he made the acquaintance of Bishop Ambrose, the most influential Christian churchman of the day. Influenced, perhaps, by Ambrose's sermons, Augustine became interested in Neoplatonic writings, which led him to abandon his Manichean beliefs. On the advice of his friend Theodorus, a philosopher, he read the Platonists Plotinus and Porphyry and was delighted by their writings. But their emphasis on the spiritual world left Augustine feeling unfulfilled, as he was also concerned with his physical being and sought instruction on how best to control his passions and emotions. His study of Neoplatonism, which grafted philosophy onto theology, drew him further into an investigation of Christian thought.

Consequently, Augustine turned to the gospel of Saint Paul for answers to his questions. In the eighth book of his *Confessions*,

Augustine describes his struggle with faith and his contempt at his own inability to control his physical desires. He describes his final conversion in a garden in Milan—where, on hearing a childlike voice saying, *Tolle, lege; tolle, lege* ("Pick up and read"), he opened his text to Romans 13:14 and read Saint Paul's message about physical concupiscence. It was now August 386.

Following his conversion, Augustine resigned from his teaching position and traveled to Cassiciacum with his mother, his son, and a few students. In the next two years, he wrote at least four books. He was baptized by Ambrose in 387.

After Monica's death in 388, Augustine set up the first monastic community in Latin Africa. His quiet life of writing and contemplation was not entirely satisfactory; at one point he earnestly considered leaving his community to take up a solitary life in the desert. The death of his son Adeodatus c. 390 gave him a deep sense of disappointment yet renewed his commitment to his work. On a visit to Hippo Regia in 391, he was compelled to take up the responsibilities of the priesthood as an assistant to the elderly Bishop Valerius. Five years later, after Valerius's death, Augustine became the bishop of Hippo. Until his own death thirty-four years later, he served the community of Hippo Regia as its religious leader and as the presiding judge in its civil court. He also continued his career as a prolific writer. At the time of his death he had completed 113 books and had written more than 200 letters. In addition, nearly 500 of his sermons are still extant. Some of Augustine's writings were directed against Manicheism. His thirteen books on this subject, in which he attacked almost every aspect of Manichean beliefs and defended the Christian scriptures, led to the demise of Manicheism as a religion.

As Augustine understood it, his role as bishop included being a defender and interpreter of church doctrine. Thus he also excoriated the Donatists, who believed that the church had been too forgiving of those who had abandoned their faith during the reign of the emperor Diocletian. The Donatist schism had long been a problem for the state and the church; in fact, the Roman police had to protect the countryside from the secular branch of the group, known as the Circumcellions, who roamed about terrorizing Catholics. Augustine spoke out against the Donatists' criticisms of the Christian church; in his anti-Donatist

arguments he stressed the unity of the Catholic church, maintaining that a schism denied the Holy Spirit's true gift of charity. Augustine also argued against the Donatists' belief that the sacraments were effective only when delivered by a human minister who was undefiled—that is, free of serious sin. The attempts to reach a peaceful agreement between the church and the Donatists culminated in 411, in a council at Carthage, where Augustine argued against Donatism before Marcellinus, the imperial commissioner. The verdict was in Augustine's favor; the Donatists were cast out as misbelievers and Donatism was forced to go underground.

In 412, Augustine turned his attention to the Pelagians, another sect he regarded as heretical. The founder of this movement, Pelagius, had visited Rome c. 400 and had claimed to be horrified by the decline he observed in the moral standards of the church. Pelagius denied original sin and declared that salvation could be attained by sheer willpower. Moreover, he asserted that humanity did not require redemption, because each individual had a choice about whether or not to sin; consequently, he considered Jesus Christ not a savior but rather an inspiration or role model. Augustine found this view of sin and salvation simplistic; he responded with the argument that humanity can rely only on God for salvation and that true salvation can occur only when humanity recognizes its absolute dependence on God.

While he was confronting the Pelagians' challenge, Augustine worked on his masterpiece, *De civitate Dei* (*The City of God*). This was a time of political and religious instability; an attack on Rome by Alaric in 410 had made the Romans fear that Africa was next, and the church was being blamed for the decline of the empire. During the crisis, Augustine was primarily responsible for holding the Christian church together. When the tribune Marcellinus asked Augustine to write a work that would address the situation, he spent fourteen years writing *The City of God*. The work deals with such timely concerns as the pagans' accusation that the disaster was a result of Rome's apostasy, but it also narrates the history of human and divine affairs from before the earth was formed until its final destined end. Augustine died on 28 August 430, while Vandal armies were besieging Regia Hippo. That he had been able to contribute so much to theological and philosophical thought during the fall of Rome was a remarkable achievement.

Authari

Authari (d. 590) was a king of the Lombards (r. 584-590). He was the son of Cleph, who had been selected king in 572 following the assassination of King Alboin. Cleph in turn had been assassinated in 574, and from then until 584 there was an interregnum during which the Lombard dukes pursued their own interests at the expense of the kingdom as a whole. The inevitable weakness that resulted invited invasion by the Franks, and this threat encouraged the dukes to elect Authari in 584.

The Lombard historian Paul the Deacon reports that, in order to strengthen the monarchy, each of the dukes gave up half of his lands to create a royal domain. This land base continued to support the Lombard kings as long as the Lombard kingdom lasted, and it freed them from the necessity of collecting the land tax which the Byzantines had attempted to reintroduce following their defeat of the Ostrogoths in 552.

To meet the threat posed by the Franks, Authari sought an alliance with the Bavarians. That alliance was sealed by Authari's marriage to

the Bavarian princess Theodolinda, who came to Italy with a Catholic entourage and gained a reputation there as a patron of the arts (she is credited with making a number of important artistic gifts to the cathedral of Monza). According to Paul the Deacon, when Authari died Theodolinda was asked to select a new husband to succeed him as king, and she chose Agilulf, duke of Turin.

Averroës and Averroism

Ibn Rushd (Abu al-Walid Muhammad ibn Ahmad ibn Rushd, 1126-1198), known in medieval Europe as Averroes, was born in Cordoba in Muslim Spain to a family of scholars and Islamic jurists. He himself became a judge as well as a physician and astronomer and is considered one of the most important philosophers of the Middle Ages. He served the rulers of the Almohad dynasty, who controlled Arabic

Spain from their capital in Marrakesh. Around 1169, the renowned philosopher and physician Ibn Tufayl (1105-1185) presented him to the caliph, Abu Yaqub Yusuf (r. 1163-1184). The caliph, who was knowledgeable in philosophy but perplexed about abstruse areas in the philosophy of Aristotle, assigned Averroës the task of writing interpretations of Aristotle's books. Averroës began this work while acting as a judge in Seville and in Cordoba, where, according to some sources, he was the chief justice. In 1182, he succeeded Ibn Tufayl as chief physician of the Almohad court. After the death of Abu Yaqub Yusuf, Averroës served his son, Yaqub al-Mansur (r. 1184-1199), with whom he discussed philosophy and from who he received great privileges. In 1195, however, because conservative religious scholars were putting pressure on the caliph, Averroës fell from favor. His books were burned, and he was exiled to Lucena, near Cordoba, where he was further criticized for his philosophy. The caliph later called Averroës back to Marrakesh and restored him to his position. Averroës died in Marrakesh not long afterward; his remains were moved to Cordoba.

Aristotle, *Omnia quæ extant opera* . . . with the commentary of Averroës.
Venice: Apud Iuntas, 1552. Reproduced from original held by Department of
Special Collections of the University Libraries of Notre Dame.

Averroës wrote books on Islamic law; of these, the most influential in
the Muslim world was the *Bidayat al-mujtahid* (*The Distinguished
Jurist's Primer*). He also wrote on medicine. Some of his works were
translated into Latin in the thirteenth century, most importantly *al-
Kulliyat* (*The Generalities*; in Latin, *Colliget*). In his work, Averroës

focused largely on philosophy. He wrote several books addressing the apparent inconsistencies and conflict between philosophy and theology, the most notable being *Fast al-maqal* (*The Decisive Treatise*), which makes a case for religion and philosophy as harmonious; *al-Kashfan manahij al-adillah* (*The Exposition of the Methods of Proof*), criticizing theological interpretations of the language of scripture; and *Tahafut al-tahafut* (*The Incoherence of the Incoherence*), commentin on *Tahafut al-falasifa* (*The Incoherence of the Philosophers*) by the Persian philosopher al-Ghazali (1058-1111) and defending philosophy against al-Ghazali's criticism. *Tahafut al-falasifa* was partially translated into Latin in 1328 (and fully translated in 1526). The other two works were not available in Latin during the thirteenth and fourteenth centuries, and for that reason were known to almost no Latin scholars of the time.

Averroës was famous in medieval Europe for his commentaries on the books of Aristotle, Muslims in the east had become interested in Aristotle during the ninth century, when his books were translated and interpreted under the patronage of the caliphs in Baghdad. The Middle East had come into contact with Aristotle's works through Syrian scholars, whose intellectual ancestors, hellenized under Greek rule before the emergence of Islam, had studied Aristotle and his Greek commentators. As with science and philosophy in general, interest in Aristotle spread through the Muslim empire to Andalusia, where caliphs as early as the ninth century supported endeavors in this field. Averroes's commentaries were important because Aristotle's teaching is in many places difficult to understand, and Averroës strove to provide a clear, accurate interpretation. His commentaries, which followed Aristotle's books closely, took three forms: "short" commentaries comprising epitomes of Aristotle's text, "middle" commentaries addressing the original text paragraph by paragraph, and "great" or "long" commentaries reproducing the entire original text in segments interspersed with Averroës's own analysis.

Many of the commentaries were translated into Latin, in response to the interest of Latin scholars who were reading Aristotle and facing the same difficulties of understanding as the Arabic scholars before them. The translations that had the greatest impact were the commentaries on the books on metaphysics and natural philosophy (the study of the natural, or physical, world, which today we would classify as science):

the great commentaries on *Physics*, *De caelo*, *De anima*, and *Metaphysics*; the middle commentaries on *De generatione et corruptione* and *Meteorological* (Book 4 only); and the short commentaries on *De caelo*, *Parva naturalia*, and *De animalibus*. These translations seem to have been made during the 1220s and 1230s in intellectual circles in southern Italy, with the support of Frederick II (1194-1250), Holy Roman emperor and king of Sicily,

The commentaries became central to the study of Aristotle, and among Latin writers in medieval Europe, Averroës came to be known as "the commentator," just as Aristotle was called "the philosopher." Certain theories found in their books posed problems for Christian readers. Because he reiterated and expanded on Aristotle's teaching, Averroës received much of the blame for the controversy the theories aroused. The most provocative was Aristotle's case in *Physics* and *De caelo* for the eternity of the world, a notion in direct conflict with creation *ex nihilo* as taught in Genesis. Averroës was also held responsible for a theory of the "unicity" of the intellect, sometimes called monopsychism, based on Aristotle's brief, cryptic description of the human intellect in *De anima* and developed in Averroës's commentary on that work. According to this theory, there is one intellect shared by all of humanity, which individuals "borrow" for the duration of a lifetime only. In order to account for conceptual thinking and the process of understanding, Aristotle had posited two intellects, an "active" or "agent" intellect and a "passive" or "potential" intellect, explaining that the active intellect exerted influence on the passive intellect in order to bring about knowledge. Aristotle said that the active intellect was somehow "separate," but as his description in *De anima* was brief, readers were (and still are) puzzled as to whether the intellects were located within individual human beings. The great Persian philosopher Ibn Sina (980-1037), known in Europe as Avicenna, held that the active intellect was separate and, since Aristotle had taught that separate substances are unique, that there was only one active intellect for all human beings. Averroës reasoned from Aristotle's account that the active and the passive intellect must each be separate and unique. During the life of a human body, the intellects were individuated by being related to it; but the individuated intellects did not survive the death of the body: rather, they were reabsorbed by the

single, unified intellect. This conclusion had dangerous implications for Christian theology, which held that the intellect is part of the human soul: unicity meant that there could be no immortality of the soul and therefore no afterlife, no judgment of souls by God, and consequently no accountability for sin.

By the end of the thirteenth century, those who supported the dangerous opinions of Aristotle and Averroës were sometimes scornfully called Averroists (*Averroistae*). In modern scholarship, these thinkers, such as Siger of Brabant (c. 1240-c. 1284) and Boethius of Dacia (fl. 1275), are often referred to as Latin Averroists. At the University of Paris, the center of theological study in Europe during the thirteenth century, there were several prohibitions against teaching Aristotle, Averroës, or their more contentious principles—most notably in 1277, when Bishop Etienne Tempier listed and banned 219 principles on pain of excommunication. Some modern scholars have compared the actual views of Averroës with these "condemnations of 1277" and with the opinions of Averroists and have concluded that the Averroists' thought is not truly representative of Averroës himself; consequently, they prefer to call these thinkers "radical" or "heterodox" Aristotelians. Nevertheless, the term "Averroist" is still widely used.

An important concept attributed to the Averroists was the "double truth"—a view was that something can be true according to philosophical reasoning but not according to faith or, conversely, true according to revelation but not reason. Neither faith nor reason took priority; the opposing truths, such as creation and the eternity of the world, simply had to be seen in separate contexts. This concept offered a loophole for philosophers whose ideas conflicted with the scriptures, and it was condemned in the preamble to the condemnations of 1277 and in anti-Averroist polemics; but evidence of actual adherence to the doctrine is scarce.

Modern scholarship has associated Averroism in Italy with the University of Padua, owing to the thinking of several philosophers there in the fifteenth and sixteenth centuries, such as Paul of Venice (Paulo Nicoletti, c. 1369-1429); Gaetano (Cajetan) of Thiene (1387-1465), who was Averroist more by historical reputation than by persuasion; and two of Gaetano's students: Agostino Nifo (1469 or 1470-1538), who began his career at Padua and altered his Averroist views in his later

work, and Nicoletto Vernias (1420-1499). Remarks by Petrarch (Francesco Petrarca, 1304-1374) in his *De sui ipsius et multorum ignorantia* criticizing four philosophers led the great scholar Ernest Renan to extrapolate the presence of Paduan Averroism as far back as the fourteenth century. The notion of a Paduan Averroist tradition before the fifteenth century has since been revised, however; although Aristotle was discussed, there is little evidence of proponents of Averroist theories at this time in Padua. Figures previously associated in modern scholarship with Padua and Averroist thought are now seen in a different light. Peter of Abano (c. 1250-1316), who taught at Padua starting in 1307, was at one time considered an Averroist because he insisted on discussing philosophy without considering religious doctrine; but it has now been shown that he did not accept the unicity of the intellect. Marsilius of Padua (c. 1275-c. 1343), who taught in Paris, probably had no connection with the University of Padua and is now believed not to have adhered to Averroist doctrine. One scholar who has been described as Averroist and who did have links with Padua, Blasius of Parma (Biagio Pelacani, c. 1347-1416), taught there from 1382 to 1388; but he also taught extensively at other universities (at Pavia c. 1374-1378 and 1389-1407, and at Bologna from 1379 to 1382), and while he did hold that the soul was material and therefore not immortal, his classification as an Averroist has been called into question.

In contrast with the decline in the idea of a Paduan Averroism, there has been growing recognition of Averroist opinions in Bologna in the fourteenth century. In addition to Blasius of Parma, we find Taddeo of Parma (active c. 1320), a student of the Aristotelian commentator Gentile of Cingoli (active in the 1290s); Taddeo's *Questions on the Soul* shows Averroist leanings. Angelo of Arezzo (active c. 1325) almost certainly supported the theory of the unicity of the possible intellect, though he acknowledged—apparently more out of duty than conviction—that it contradicted Christian faith and hence should not be believed. Additional scholars in Bologna at this time who have been identified as Averroist include Anselm of Como (arts master, c. 1325-c. 1355), Matthew of Gubbio (arts master, c. 1334-47), James of Piacenza (arts master, c. 1340-1343), and Cambiolo of Bologna (probably arts master at Bologna, active c. 1333). The criteria for classifying medieval Italian writers as Averroist have come under scrutiny as modern scholars of

Italian Averroism (and of European Averroism in general) consider the problem of defining Averroism in terms of the views it comprises and the way it evolved.

In spite of the controversy surrounding some of his ideas, Averroës was recognized in medieval Europe as essential to philosophical study because of the detail and clarity of his commentary. Even scholars who disagreed with him read his commentaries along with Aristotle, and their own commentaries were influenced by the form and content of Averroës's.

Aversa

The dry of Aversa is in southern Italy, about 20 miles (32 kilometers) north of Naples but part of the province of Caserta. Aversa was the seat of the first permanent Norman establishment in southern Italy and became the nucleus of the Normans' power in that region. The history of the city began in 1022 when Emperor Henry II (973-1024) granted the territory around the ruins of ancient Atella to a band of Normans led by Rainulf (d. 1045) who had arrived in southern Italy in 1017. In 1030

Rainulf was named count of Aversa by Duke Sergius IV of Naples; Sergius was motivated to do this because he felt threatened by the aggressive actions of the Lombard prince of Capua, Pandulf, who had recently concluded a successful campaign in the Abruzzi. In 1038, at the conclusion of a campaign by Emperor Conrad II (c. 990-1039) in southern Italy, Rainulf was solemnly invested as count of Aversa and the Norman colony was recognized as a fief of the prince of Salerno, Guaimar V, whose territory now included Capua. In 1047, Emperor Henry III (1017-1056) agreed to recognize Rainulf as count of Aversa. Aversa was raised to a bishopric by Pope Leo IX (1002–1054) at the request of a subsequent count, Rainulf's nephew Richard I (d. 1078). In 1053, Richard began the construction of the cathedral, a work concluded by his son Jordan (d. 1090). Richard expanded his lands, and the fortunes of Aversa generally followed those of its Norman rulers until the city was sacked by the army of Emperor Henry VI (1165-1197). Andrew of Hungary, the husband of Joanna I, was murdered in the castle of Aversa in 1345.

Aviary

Birds have served as practical and allegorical images throughout human history. From the earliest cave paintings, such as those found at

Lascaux, the bird has served as a totemic image; in later times, it was a subject of innumerable depictions in decorative and lifelike settings. In the wall paintings of ancient Egyptian tombs and in Roman mosaic floors, birds often inhabit a naturalistic landscape. Abstracted as symbolic form and characters, they became a common image in hieroglyphics. Appliquéd images in the art of early barbarian Europe were carried over into medieval mosaics, altar frontals (such as that of Duke Ratchis, c. 799), and reliquaries. In medieval works of art and literature, birds were symbolic images. As early as the second century after Christ, literal and pictorial descriptions took on the form of allegorical images when lessons about the nature of animals could be seen as examples of some aspect of human life and morality.

The earliest medieval texts derive from ancient sources such as Aristotle's or Aelian's *Historia animalium* or from the Septuagint. Saint Melito (died c. 190), bishop of Sardis, probably compiled the first book on the nature of birds: *De avibus*, which is part of his *Clavis Scripturae* (*Key to the Scriptures*). In the tradition of the early church fathers, Melito identifies the sources from which he acquired his information. He relied primarily on the Old Testament, and so he focuses on the theological or mystical value of the natural world, which he divides into general categories before discussing individual birds. His opening chapters treat birds in general, flight, the wings of the bird, and what all winged creatures mean to the faithful allegorically. Under the heading *Aves*, he also includes other flying creatures such as scarab beetles, bees, locusts, and mosquitoes.

The first medieval book of animals, *Physiologus*, of unknown authorship, dates from the second century and contains quasiallegorical stories about birds. *Physiologus* appeared in various versions in Christian literature through the fifth century. Birds make up only a small part of it—rarely are more than eleven mentioned—but the content varied, depending on the geographical area in which a given version was written. The Smyrna edition, for example, has different birds from later English editions, and the English versions differ from the French and German. *Physiologus* was superseded in the seventh century by the *Etymologies* of Isidore of Seville (c. 560-636), who made the first synthesis of other stories and local traditions about certain animals.

In books containing stories about and images of birds, the images

might have a purely decorative function, but such books might also serve as manuals for hunting, with little or no allegorical description. Books on falconry by Albertus Magnus and the famous *Art of Falconry* (*De arte venandi cum avibus*) composed by Emperor Frederick II were quite different from the early *Physiologus* and from subsequent bestiaries and might be regarded as leaning toward a more practical, if not empirical, approach. Albertus and Frederick did very little moralizing and offered few allegorical comments; rather, they approached their subject in terms of avian behavior that would enable a hunter to find and kill birds and prepare them for eating. However, this factual, objective approach was not generally followed in the bestiaries.

In the later Middle Ages, as encyclopedic collections of stories about birds grew and became synthesized, the limited focus of *Physiologus* was replaced by the larger bestiary. By the mid-twelfth century, the first specialized *Aviaryum* was compiled by Abbot Hugh of Fouillooy. This contribution to the expansion of the traditional bestiary was probably accidental: several comments lead the readers to believe that Hugh intended to include other animals. He relates stories about birds in detail but not necessarily in a comprehensive way. Hugh's opening chapters on the dove, for example, are both a compilation and an imaginary conflation to fit the desired theological lessons. He sees the "silvered" dove (in Chapter 2) as having the "beak of preaching" and its color as a sign of divine eloquence; the dove's feathers are monastic teachers, and its wings are the wings of contemplation by which one can transcend worldly things. The dove also has earthly value, serving as a metaphor for the church: as the dove looks out for the hawk, so the church watches for the devil. Hugh later describes the dove allegorically (in Chapter 3); still later the rest of the body is discussed at length (Chapter 4). Several chapters follow on the hawk, turtledove, and sparrow, as well as on the cedars and palm trees which they were said to inhabit. Along with common birds such as the hawk, Hugh takes up birds that were less well known to his European audience—e.g., the ostrich—and fictitious birds such as the phoenix and *caladrius*. Other common birds Hugh presents include the crane, stork, heron, kite, blackbird, jay, quail, partridge, swan, hoopoe, goose, and owl. He reserves for last the more spectacular peacock and eagle.

A characteristic evolution of an image in the Middle Ages can be

seen in the *caladrius*, a mythical bird also called the *calandrino*, *calandrello*, *cbaradrius*, or calendar bird. Isidore of Seville described the *caladrius* in his *Etymologies*, and it has since been identified with several species, including the dove and the goldfinch. It is also described in later versions of *Physiologus*, a fact which suggests that it may have a history predating Isidore. It later appears in the *Vita acerba* of Cecco d'Ascoli (1322) and in Leonardo da Vinci's *Fior di virtù* (c. 1500-1510). The *caladrius* had a shorter life in pictorial art, appearing mostly in the fourteenth and fifteenth centuries in Italy. Friedmann (1947) counted 489 paintings depicting the goldfinch-*caladrius*, of which 450 were Italian. According to a legend transmitted in varying degrees of detail by Hugh of Fouilloy, Cecco d'Ascoli, and Leonardo, the *caladrius* plays a dual role: if the bird looks on someone who is ill, that person will get well, but if it turns its head away the person will die. (Similar myths are found in other cultures, though the animal may be different.) At the heart of this legend is the *caladrius* as a metaphor for Christ or Mary—each may look on ill persons, whose fate is then based on how they conducted their lives. The legend and the metaphor both reflect popular theology, in which illness and death are seen not as natural phenomena but as a consequence of sinfulness and evil. The use of the *caladrius* or any other fowl in divination borders on magic, which was condemned early on by Augustine in opposition to Mithraic cults. The *caladrius* was important as allegory rather than as a real bird found in nature.

Avicenna

The Persian philosopher, poet, and physician Ibn Sina (Abu Ali al-Husayn ibn Abdallah ibn Sina; 980-1037) is known in the west as Avicenna. He was born in Bukhara and died in Hamadan, Persia.

Avicenna was famous in Italy during the Middle Ages as the author of the *Canon of Medicine* (*al-Qanun fi 'l tibb*), a gigantic medical encyclopedia that remains one of the most remarkable achievements of medieval philosophical thought. The *Canon* was first translated from Arabic into Latin by Gerard of Cremona and his pupils in Spain during the twelfth century, and thereafter it formed the basis of the medical curriculum at every university in the medieval west. Avicenna's great work is so comprehensive, well-constructed, and detailed that today it is still the foundation for medical teaching in some parts of the Middle East.

The life of Avicenna resembles that of many celebrated sages from the east. He was born into an educated family and displayed remarkable precocity at an early age, learning the Qur'an (Koran) from memory and then studying texts of natural philosophy and medicine; by the time he was sixteen, he was already a famous physician. He spent most of his life wandering throughout Persia, often following a wealthy patron, and serving as a physician, teacher, and government official. In the Islamic world, he is famous as a natural philosopher whose melding and reconciliation of Aristotelian, Neoplatonic, and Muslim thought was universally admired in Arabic-and Persian-speaking cultures.

Avicenna, *Arabum medicorum principis*. Venice: Apud Iuntas, 1595. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

From the standpoint of medieval Christian culture, Avicenna's achievement was twofold. Not only did he return Aristotle's and Galen's medical thought to the west after it had been lost for many centuries, but he also helped establish the physician as a gentleman, whose decorous behavior admitted him to the most intimate circles of the wealthy and powerful. In the Islamic world of Avicenna's time,

medicine was much more than mere cures for sundry diseases: it was the dispensing of learned advice about the welfare of the body. The medieval Muslim physician, like Galen in the second century, applied an intimate knowledge of nature, combined with astrology, pharmacy, and not a few merry tales and bits of gossip, to teach his patrons how to live well. It is not surprising, then, that men like Avicenna, who wrote numerous medical and philosophical treatises, also took up poetry as a mark of their gentility.

Avicenna's cultured, philosophical medicine had an immediate appeal to Latin-speaking physicians. Aristotle had said that where natural philosophy ended, there medicine began (*De sensu*, Book 1, 436a), but, to the constant frustration of medieval physicians, he did not elaborate on this point, Avicenna was the first philosopher to demonstrate how medicine might indeed be a development from natural philosophy and therefore a subject worthy of advanced study.

Avignonese Papacy

The term "Avignonese papacy" refers to the period when the popes were resident in the city of Avignon, on the east bank of the Rhone, from 1309 to 1376. The Great Schism brought another line of popes to Avignon from 1378 to 1417.

The papacy first came to Avignon because of disturbances in Rome following the death of Pope Boniface VIII in 1303; these disturbances prevented his successor, Benedict XI, from returning to the city. Benedict's successor, Clement V, considered it dangerous even to be crowned in Italy and therefore transferred the papal court to the safety of his native France in 1305. The move was intended to be temporary, but conditions in Italy made a return impossible throughout Clement's reign. From 1305 to 1309, Clement stayed briefly in several cities in the south of France. As he traveled about, he found himself pressed constantly by the French king, Philip the Fair, to assist in various political schemes. Clement was drawn to Avignon in 1309 partly because of the discomfort of continual travel (he became seriously ill at about this time) and because he was being put in an awkward position by Philip's requests, Philip being not only a king but technically Clement's host. Avignon was attractive because it was in papal rather than French territory—it belonged to a papal vassal, Robert of Anjou (king of Naples and Sicily), and it lay within the county of Venaissin, which had been a possession of the papacy since 1274—yet it was just across the Rhone from the protection of France. Moreover, it was not far from Vienne, where Clement intended to hold a general council in 1311. Avignon suited Clement so well that he made it his principal residence for the remainder of his pontificate, living in temporary quarters at the city's Dominican convent.

Clement's successor, John XXII, had hopes of returning to Italy and residing in Bologna; but Bologna proved as unsettled as Rome, and so John spent his eighteen-year reign at the episcopal palace in Avignon. John's relatively long pontificate gave an air of permanence to the papal residence at Avignon. Although his successors continued to talk of returning to Rome, they began to settle into Avignon for a long stay. During the reigns of Benedict XII and Clement VI the papal curia grew to more than 4,000. These popes (especially John XXII) generated considerable wealth through improved methods of ecclesiastical taxation, which allowed them to put vast sums into the construction of a papal residence and other improvements within the city. Their efforts gained momentum during the mid-1330s, when the last vestiges of papal control in central Italy were lost. Benedict XII began a fortified palace on the site of the old episcopal residence, and Clement VI expanded the palace: his court there became the most splendid in Europe. When the Hundred Years' War began in the late 1330s, a massive wall was erected around the city to protect it from marauding mercenaries. Finally, in 1348, Clement VI purchased Avignon from the Neapolitan crown so that the papacy might have a direct claim to it.

The building programs of the Avignonese popes made them the leading patrons of art in Europe during the mid-fourteenth century. They engaged not just local artists but noted Italians like Simone

Martini and Matteo di Giovanetti to provide decorations for the new buildings. In the papal palace and in a number of secular buildings in Avignon these Italians created frescoes and other works that established throughout Provence the strong influence of the Sienese pictorial tradition. Under their influence, a school of painting emerged in Avignon that lasted into the fifteenth century and provided an important conduit for the transmission of Italian monumental classicism into northern Europe. The popes' increasing patronage of art and the concomitant luxury that developed in the curia at Avignon have led some authorities to consider the Avignonese papacy a forerunner of the Renaissance papacy at Rome. The popes' largesse also caused literary figures to gravitate to Avignon, among them Petrarch.

By the 1350s, however, the popes were again seriously contemplating a return to Rome. The mercenary bands of the Hundred Years' War now posed such a threat to Avignon that even fractious Italy seemed attractive. Clement VI tried to pacify Romagna in 1350-1351 but failed miserably. His successor, Innocent VI, fared better. Innocent wisely chose as his commander in Italy the famous soldier and diplomat Cardinal Albornoz, who had recently arrived at the curia from Castile. Between 1353 and 1358 Albornoz fought a series of brilliant campaigns that regained all the old papal lands, although from 1358 to 1364 he continued to struggle with Ghibelline forces in the north who threatened the security of his conquests. Innocent VI died before he could return to Rome, but his successor Urban V did go back in 1367. Unfortunately, the papacy's hold on the city was not as strong as Urban had supposed, and disorders forced him to retreat to Avignon in 1370. Gregory XI returned the papal court to Rome permanently in 1377.

Church historians often consider 1377 the end of the Avignonese papacy, because from that date popes resided in Rome who were considered legitimate in later ecclesiastical thought. But Avignon continued to be the seat of a papal court until the early fifteenth century. When the Great Schism began in 1378, one of the claimants to the papacy, Clement VII, took up residence at Avignon because his rival held Rome. Clement and his successor Benedict XIII reigned at Avignon until the end of the schism in 1417. During the interim, a significant portion of Christendom—including the kingdoms of France, Scotland, and Portugal and the duchy of Savoy—accepted the leadership

of these Avignonese popes.

The Avignonese popes displayed great energy in a variety of areas. They founded many universities, promoted missionary work in Asia, vigorously suppressed heresy, and pursued successful reforms of the clergy and of ecclesiastical government. Despite this, however, they came under considerable criticism from several quarters. Because all the Avignonese popes were French and the curia was located so close to France, some people, especially the English, felt that these popes were controlled by the French monarchy. Such suspicions were fed by the fact that an inordinate number of Frenchmen were appointed cardinals during the Avignon papacy: 111 of 134. In Germany, much hostility was generated by a twenty-four-year struggle between the papacy and Emperor Louis IV (c. 1283–1347). Throughout Europe, the lower clergy resented the popes' rigorous new methods for gathering revenue. And reformers, who increasingly favored apostolic poverty, found the pomp and luxury of the papal court as offensive as the bribery and corruption in curial government. Figures as diverse as Catherine of Siena, Bridget of Sweden, and Petrarch assailed and sometimes exaggerated Avignon's immorality. They came to refer to the papacy's stay in Avignon as a "Babylonian captivity."

The Avignonese papacy was neither as corrupt nor as ineffectual as its critics charged. For the most part, the Avignonese popes were dedicated men trying to make the best of a difficult situation. But the challenges they faced were enormous. The political authority of the papacy was declining rapidly, while national states were growing in power and wealth. The cardinalate was riven by factions that often impeded and sometimes paralyzed papal government. Above all, the loss of Italy denied Avignon's popes three major sources of income vital to papal government: the tithes of the clergy of central Italy, the taxes from their Italian lands, and the gifts of pilgrims. The fiscal measures the Avignonese popes adopted to compensate for this caused a great deal of the criticism leveled at them. To maintain papal government, the popes turned to the regular use of extraordinary and questionable money-gathering practices that had developed during the thirteenth century. Most obnoxious was the systematic collation of benefices, which effectively borrowed the income of local churches to cover the expenses of the curia. This thoroughly alienated the local clergy and

proved financially and administratively counterproductive. A policy of centralization exacerbated the problem by expanding the number of officeholders in the curia, and thus the number of benefices needed by the papacy.

These measures and the building projects and patronage upon which ecclesiastical taxes were spent led many to conclude that the Avignonese papacy was greedy, luxury-loving, power-hungry, and unconcerned with the true problems of the church. Instances of real corruption confirmed this impression. The prestige of the papacy might have been restored if the popes' return to Rome had been followed by a period of energetic reform. Instead, it was followed by the Great Schism.

Azo

Azo (Adso, Azone Azzo, Azzolino, Azzone; sometimes dei Porci or Soldani; c. 1150-1220 or 1230) was one of the greatest and best-known teachers of and experts on civil law connected with the university at Bologna during the first half of the thirteenth century, when the school was at its zenith. Of his life little is known for certain, and even his birthplace is a matter of dispute, though Bologna is generally accepted. However, he appears in numerous Bolognese documents, private and civic, between 1190 and 1220. Azo had five sons who survived him, and their descendants took the surname Azzi.

Azo studied in Bologna under Giovanni Bassiano and by 1190 was a doctor of law. He is said to have had many students, including several

major figures in canon law—Tancred, Laurentius Hispanus, and probably Sinibaldo Fieschi, the future Pope Innocent IV—as well as scholars of civil law: Iacopo Baldovini; Roffredo Beneventano; Martino da Fano; and Accursius, who compiled the famous *Glossa ordinaria*, the standard study of the civil law code. Azo's own major contributions to scholarship were *Summa codicis* (which glosses, or comments on, the first nine books of the *Codex* portion of *Corpus iuris civilis*) and *Summa institutionum* (on the *Institutes* of Justinian). Of thirty-one extant editions between 1482 and 1610, all but one (Speyer, 1482) are combinations of these two works with one or more of the other studies (*Extraordinaria*) that complete the text and commentary on the *Corpus*-, the glosses of Piacentino on the three remaining books of the *Codex*; those of Bassiano on the *Authenticae*; and those of Bulgaro Bolgarini, Bassiano, and Azo on the *Digest*. Azo honored his promise to make his commentaries clear and useful ("nothing obscure, nothing dubious, nothing contrary to the laws"), unlike much earlier scholarship, which seemed purposely vague or esoteric. Azo also treated the law as an integrated whole rather than as isolated pieces and thus captured—or imposed—a unifying spirit. Legal scholars as far away as Henry Bracton in England (d. 1268) were influenced by this novel approach. Closer to home, the importance of the *Summae* to anyone seeking to practice law in northern Italian cities was underlined by a witticism: *Chi non ha Azo non vada a Palazzo*, ("Whoever does not have Azo may not go to City Hall").

Azo's commentaries, or glosses, on Roman law also appear scattered through many collections. In Accursius's *Glossa*, for example, one-third of the comments attributed to his predecessors are Azo's. Other surviving compilations of Azo's legal work include *Brocarda*, which attempts to reconcile apparently contradictory rules of law; fifty-three legal *Distinctiones* from a manuscript in Brussels; and nineteen scholastic *Quaestiones* for formal academic disputation (of which seven were presented by Bassiano to his student Azo). A series of Azo's lectures (*Lectura*) on the *Codex* were recorded by a student, Alessandro di Sant'Egidio, and these shed a good deal of light on the methods and dynamics of classroom presentation. Unfortunately, only a late printed edition (Paris, 1577) exists, which presents the modern scholar with problems of textual integrity.

Ballata

A *ballata* is a poetic and musical form. This brief lyric consists of an initial stanza with a unique meter and rhyme scheme, called the *ripresa* or *ritornello* (refrain), followed by one or more stanzas with a common meter and rhyme scheme. These stanzas are divided into two parts: a *fronte* and a *sirima*; the *sirima* concludes with one or more verses that borrow meter and rhyme from the *ripresa*. The *ripresa* establishes the theme of the composition. In performance, the stanzas are associated with a solo voice and the *ripresa* is associated with a chorus.

The structure of the *ballata* (plural, *ballate*) resembles Provençal dance compositions of a metrical type that reached its mature form at the court of Charles of Anjou in Provence. The genre was diffused in Tuscany in the mid-thirteenth century, and the first Italian *ballate* were composed by the Siculo-Tuscan school of that period. In the early fourteenth century, Dante reaffirmed the link between the *ballata* form and dance (*De vulgari eloquentia*, II.3.5).

The recurring pattern of rhyme and theme in a *ballata* is reminiscent of the ancient rhetoric of praise. Jacopone da Todi (c. 1230-1306) established an enduring tradition of Christian hymns of praise, or *laude*, in the *ballata* form, with compositions such as *O iubelo del core*. The master of the secular *ballata* was Guido Cavalcanti (c. 1255–1300), whose extant corpus includes eleven *ballate* but only two *canzoni*. De Robertis (1961) has shown that Cavalcanti's fluid, natural amplification of ideas within the stanzas of hendecasyllabic *ballate* distinguishes

them from contemporary *canzoni*, in which there is a more rigorous marshaling of arguments. This was a major contribution to the *dolce stil nuovo*, and an essential lesson that Dante learned from Cavalcanti, who was one of his earliest friends. Cavalcanti's most celebrated *ballata*, *Perch'io no spero di tornar giammai*, is composed in hendecasyllables and heptasyllables. The rhyme form of the *ripresa* is Wxxyyz and that of the stanzas is ABAB Bccddz (hendecasyllables are represented by capital letters). Cavalcanti expands the expressive potential of the recurring rhyme, engaging it in conversation with the stanzas, as Ugo Foscolo pointed out in the early nineteenth century.

The *ballata* form was explored by exponents of the *dolce stil nuovo*, including Dante and Cino da Pistoia, but Dante considered it inferior to the *canzone*, though superior to the sonnet. Francesco Petrarca, who included only seven mono- or distanzic ballatas in his *Canzoniere*, diminished the prestige of the genre relative to the *canzone* and the sonnet. Boccaccio, in the *Decameron*, describes the singing of *ballate* and accompanying dances as part of each evening's entertainment, and other fourteenth- and fifteenth-century *novellieri* like Sacchetti and Bandello followed his lead, interpolating *ballate* into their prose and thus widening the breach between the *ballata* and more "elevated" lyric genres.

Banks and Banking

Banking in the modern sense, like much of modern business practice, has its roots not in the ancient world but in the economic revival of Mediterranean Europe that began in the tenth century. Nonetheless, to the extent that medieval banking practices were influenced by legal norms codified in Justinian's *Digest*, Roman concepts survived. Banking institutions in the western Roman empire existed to provide safekeeping for valuables, to make large- and small-scale credit available, and to perform exchange operations. As the western empire broke up, its economy regressed in comparison with the surviving eastern empire or, after the seventh century, the Islamic world. There was no longer any necessity for the more sophisticated mercantile functions of banking. Demands for credit were almost exclusively for consumption loans, to buy either luxuries for the well-to-do or essentials for those in dire straits.

The localization of minting and the consequent proliferation of coins in a bewildering variety of types, designs, fineness, and weights virtually ensured that money changers were a part of any sizable medieval community. Although evidence is scanty and often ambiguous before the thirteenth century, the great banks which appeared in Italy during that century are generally believed to have evolved from money-changing operations. In Florence, bankers in the great age of the Bardi, the Peruzzi, and the Medici were members of the *Arte del Cambio*, the money changers' guild. The earliest documents recording the activities of money changers are found among the twelfth-century notarial chartularies of Genoa. The term *bancherius*—derived from the carpet-covered table or bench (*banchus*) over which

the exchanges were made—was already in use in the mid-twelfth century as a synonym for *cambitor*, although despite this terminology the money changer was not yet a "banker." By the last quarter of the twelfth century Genoese *bancherii* were accepting deposits and making loans, so the transition to banking had begun. Moreover, the priority of Genoa in the record may reflect simply the preservation of documents rather than any precocious development of banking there.

The nature of their business required money changers to have considerable sums on hand in coin. It would have required only a small extension of the concept of exchange for the money changer to advance a sum in anticipation of receiving coins to complete an exchange at a later date. In both Roman law and canon law a *mutuum* was a consumption loan that required the borrower to return only the equivalent value of what had been lent. In Roman law any agreement for a return of more than was lent had to be promised in an additional *stipulatio* that was not legally a part of the *mutuum* contract. In later Roman law, the amount of interest that could be charged was limited. Canon law, heavily influenced by the *corpus iuris civilis*, prohibited such interest agreements altogether. Since the *mutuum* was a consumption loan, the prevailing image in the agrarian society of the early Middle Ages was of someone who needed food or seed grain borrowing under the threat of destitution. To impose an additional charge in such a situation would have been contrary to the requirements of Christian charity. An advance in an exchange operation, however, might not have been conceived of as a loan at all, and any charges involved could have been thought of as having been levied on the exchange operation rather than as a return on a loan.

Furthermore, money changers must have had strong rooms, or at least strongboxes, to keep their coins safe from thieves. It is only natural, then, that anyone who had coins or other valuables might leave them with a money changer for safekeeping. Again, Roman law provided a legal framework for *depositum*: one person's giving some thing (*res*) into the custody of another. In the simplest form of the *depositum*, the custodian was expected to return the same *res* to the depositor exactly as it had been left with him. One can imagine a sealed bag of coins, marked by a depositor, being returned exactly as it had been left. But money—unlike a horse or an heirloom—is fungible (*res*

fungibilis): i.e., the exact equivalent value of certain things, such as coins, grain, oil, and wine, can be restored to a depositor without returning exactly the same thing that was deposited. Thus Roman law also recognized the *depositum irregulare*, which required returning something of equivalent value, but not necessarily the *res ipsum* (the very thing, the thing itself). In a contract involving *depositum* the custodian was obliged to return the *res* and any increase that might have occurred. For example, if a pregnant mare gave birth to a foal while on *depositum*, the custodian had to restore both mare and foal to the depositor, though the custodian had the right to recover any expenses incurred in keeping the *res*—in this example, the cost of feeding the mare and foal. Furthermore, the custodian had an obligation to exercise due diligence in caring for the *res*; and having done so, he was not liable for theft or damage outside his control. In a *depositum irregulare*, the ownership (*dominium*) of the *res* was transferred. After a specified period of time the custodian was required to return an equivalent value to the depositor. The custodian was responsible for any losses, even accidental losses, but was not obliged to return any increase or profit he made from the use of the *res*. The *depositum irregulare* was not considered a *mutuum*, because it was a contract undertaken primarily for the benefit of the depositor, even though the custodian had the right to make use of the *res* during the specified period. Also, in Roman law, interest could be paid, and it should be paid if the custodian was late in restoring the deposit to the depositor.

These concepts of *mutuum* and *depositum*, rooted in Roman law, continued to influence the development of banking in the Middle Ages. Canon law, which took most of its structure from Roman law, had an enormous effect. The church's teachings on usury shaped the way medieval banks did business, and the influence of Roman law ensured that the church's consideration of the matter would be in legal terms. The payment of interest, both on deposits and on loans, is at the heart of the business of banking. Yet in both civil and canon law such payment was dubious and very much dependent on circumstances. The *mutuum*, a loan in its simplest form, did not oblige the borrower to return anything beyond the principal. Canon law was clear on this: any return at all beyond the principal was usury, condemned in law and in

the confessional. The church, however, recognized that in some circumstances the lender might suffer damages or incur expenses as a result of making a loan, and such an instance it was licit to receive compensation. It was also acceptable to receive a penalty payment if a loan was not repaid at maturity. There were loopholes, then, in the prohibition of usury, and canon lawyers and scholastics debated the fine points at length. Loans at interest were made—both overtly and covertly—but they incurred the condemnation of the church and the opprobrium of the community. Large-scale merchant bankers preferred to avoid these consequences, but in this area of economic activity the church's teaching and the community's attitudes were ambiguous.

Only if there was a *mutuum* could there be usury. Other kinds of transactions did not entail being condemned as usurious. Many kinds of contracts involved transferring capital temporarily from one party to another and were not considered loans, though to the modern eye the distinction might seem finespun. One of the most common contracts in the twelfth and thirteenth centuries was the *commenda*, in which one party in a single venture committed capital to the other party, who traveled to carry out the active role; both parties shared in the profits and losses of the venture. There were also various kinds of partnerships and other investments that accomplished similar purposes. However, necessity and the church's doctrine on usury combined to make the exchange contract—the *cambium*—the central business feature of medieval and early modern banking.

Manual exchange, that is, the physical exchange of coins of one kind for coins of another kind across a carpet-covered bench, remained the province of the local money changer. But by the early thirteenth century, the letter of exchange was a favorite means of transferring capital for a period of time at a profit. A charge for foreign exchange was not considered interest on a loan, because it involved *cambium* rather than *mutuum*. Exchange carried out by means of a bill of exchange involved payment in one kind of coin in one place, and collection—usually in another kind of coin—in another place. The time that elapsed was merely due to distance and so did not make the *cambium* a loan, though the effect could be much the same. In the end, while lawyers and scholastics debated the technical aspects of usury, laymen came to the widespread conclusion that only a guaranteed

return on a loan constituted usury; an uncertain return avoided this taint. A return on a *depositum irregulare* could be justified as a gift or as a share of profits realized by the banker through use of deposited funds. The *commenda*, various partnerships, and other contracts did not guarantee a specific rate of return, or indeed any return at all, and some of these arrangements entailed a risk of loss. Exchange rates could vary between the issuance of a bill of exchange and its presentation. The doctrine concerning usury, then, did not prevent bankers from using their depositors' capital for profit; but to the extent that it discouraged consumption loans, it might have channeled capital into business investment, thus benefiting the medieval economy. It certainly pushed medieval banking in the direction of exchange banking.

By the late twelfth century, bankers were using funds deposited with them to make investments in commercial enterprises and to make credit available to third parties. In 1200, a Genoese banker promised a woman who had deposited fifty *lire genovesi* in his bank that he would "employ them in trade in Genoa so long as it shall be your pleasure; and I promise to give you the profit according to what seems to me ought to come to you."

Such arrangements required relatively sophisticated record-keeping. Accounting, and ultimately double-entry bookkeeping, developed as banking operations became larger and more complex. Even at a relatively rudimentary level, these records made it possible for bankers to make book transfers from one client's account to another. By the early thirteenth century, merchants would routinely call at the bench where their banker did business to give an oral order for payment by debiting the payer's account and crediting the payee's. Almost as quickly, it became possible for clients of different bankers to settle debts by means of transfers between banks, because in most Italian cities the bankers commonly carried on their business in the same location, facilitating quick oral communication among them. In Genoa, the benches were set up in the Piazza Banchi near the port. In Venice, bankers gathered at the Rialto. Bankers in Lucca congregated in the Piazza San Martino in front of the cathedral. Bankers in Florence, perhaps because there were so many of them, formed several centers: the Mercato Nuovo, Mercato Vecchio, and Or San Michele were the most important. Perhaps because their activity was so dispersed, the

Florentine bankers seem to have led in the development of the check, a written rather than oral order to a banker to transfer funds from one account to another.

Though banking had its origins in money changing, the largest banks of medieval Italy were merchant banking houses. Italian merchants were prominent at the fairs of Champagne and other wholesale markets in northern Europe. Records show definitely that merchants from Siena were active there in 1216, and there is evidence from the 1220s that they were engaged in both mercantile and banking activities. Italian companies engaging in trade beyond the Alps would have needed to make frequent large exchanges between the currency of their home city and that of the foreign areas where they did business. It must have been very inconvenient to transport large amounts in specie for that purpose, so large firms with a great deal of capital soon arranged to achieve the same result by making transfers in their account books. Very large companies could offer these exchange services to third parties. The bill of exchange (*lettera di cambio*) was developed to meet this need. A bill of exchange was initiated when one party, the deliverer or remitter (*datore, remittente*) in, say, Siena, gave money or something else of value to the taker (*prenditore, pigliatore*) in return for a bill of exchange. The remitter then sent the bill of exchange to a payee, who was usually his correspondent in a foreign city—London, for example. That payee would then complete the transaction by presenting the bill at maturity to the payer (*pagatore*) for collection. The original remitter finally realized his return on the transaction with a second bill of exchange from the foreign place to his home city for which he became the payee. At least two bills were involved in a complete exchange cycle for a banker, and three were not uncommon. Most bills of exchange were payable at usance (*a usanza*, "according to custom"), that is, after a period related to the usual time required for a journey between the city where the bill was issued and the place where it was to be presented. Thus, if exchange was used in place of a loan, the period could be determined by the distance between the cities involved. This might vary from ninety days between Florence or Venice and London to five days between Florence and Venice. Of course, it was possible to draw up a bill of exchange and reexchange that guaranteed a certain rate of return to the remitter, or even obviated any exchange by

including a clause that gave the taker (for all practical purposes, the borrower) the option of repaying in local currency. This so-called "dry exchange" was, quite simply, a disguised loan at interest. It was recognized as such and condemned by the church as usurious. Still, it was a common practice.

The greatest single client for banking services of all kinds was the papacy, along with other prelates. General taxation of the clergy by the papacy began under Innocent III (1198-1216). Papal taxation in itself required the transfer and exchange of large sums from all over western Europe to Rome. Sienese merchant banking companies were well placed to fill this need. They had the necessary capital; the technical means had been worked out; and of all the burgeoning northern Italian cities, Siena was closest to Rome. Financing the papacy became a very large part of the banking business of the Tuscan companies in Florence and Lucca as well as Siena. In the second half of the thirteenth century, by serving as bankers to the popes, the Gran Tavola dei Bonsignori became the greatest of the Sienese companies. Almost as large was the Ricciardi bank of Lucca. Both were heavily involved in providing financial services to the church. The conflict between Innocent IV (1243-1254) and Emperor Frederick II rapidly increased the fiscal needs of the papacy. Although Siena's active support of the Staufen cause must have created problems for the Bonsignori, the firm successfully managed them and continued to grow for the next generation or more. By the 1290s, however, the Bonsignori began to experience difficulties. In 1298 it collapsed, and in the following decades several more Sienese banks failed. During this period, and especially during the pontificate of Boniface VIII, the papacy began to transfer much of its business to banks in Florence, a city that was firmly Guelph.

The fourteenth century was the great age of Florentine banking. The Bardi, Peruzzi, and Acciaiuoli were the great international banking houses of the first half of the century. There were also many smaller companies, some of which operated internationally, others only locally. Like their thirteenth-century predecessors, these were merchant banking companies, engaged in trade and manufacture as well as in finance, but the larger firms tended to lean more toward the financial side. The dominance of Florentine companies is graphically illustrated by the success of the florin, a gold coin first minted in 1252. The florin

circulated widely throughout western Europe and the Mediterranean. It became the standard of international trade and banking to such an extent that debts which might be paid in other coins, or even in kind, were often quoted in florins. The far-flung span of the Florentine banking and trading houses is illustrated by a handbook written c. 1340 by Francesco Balducci Pegolotti, a branch manager of the Bardi company. Francesco had represented the Bardi in London and Cyprus and had accumulated a wide knowledge of trade and finance; he opens his handbook with a famous description of the "journey to Cathay" and goes on to discuss weights, measures, and business conditions from Constantinople to London.

Unfortunately, the Italian banks found that finance at the highest levels, dealing with popes and kings, could be dangerous as well as profitable. The final blow to Siena's dominance of European banking came when the French king Philip IV (1285-1314) confiscated the property of Sienese merchants in France in compensation for money that he claimed he was owed by the Bonsignori. This action, coming as it did at the same time that Boniface VIII was withdrawing papal business from Siena, sealed the fate of the Sienese bank. Florentine bankers also found Philip a dangerous client, but it was in England that the great Florentine houses became most entrapped by involvement in royal finance. Since the late thirteenth century, these houses had often made large loans to English monarchs and had, in return, received favored treatment in the lucrative wool trade. The debts, secured by future tax receipts, seemed safe enough so long as relations with the king continued to be amicable—but the English kings were perpetually in need of money, and their amity was maintained only at the price of further loans. The Florentine banks thus became more and more deeply involved with royal debt. In 1336, King Edward III decided to pursue his claim to the French throne, and he expected the Bardi and Peruzzi companies to finance this war. It is a measure of their wealth that they did so for almost a decade. When Edward ultimately defaulted on his enormous debt to the banks (estimated by the contemporary Florentine chronicler Giovanni Villani as more than 1.3 million florins), the English branch of the Bardi was bankrupted. This bankruptcy set off a run on the banks in Florence that dragged down the home offices of the Bardi and Peruzzi, starting a wave of business failures in Florence in

the mid-1340s. The economic disaster was soon followed by a demographic disaster: the black death of 1348. The Florentine financial sector reeled from this double blow.

Not until the last decade of the fourteenth century did another great banking house arise in Florence and assume international prominence, that of Giovanni di Bicci de' Medici, in the fifteenth century, the Medici bank would become the leading bank, with branches all over Europe. Under Giovanni and his son Cosimo, the finances of the papacy continued to be the largest single element in the growth of the Medici bank. But because of the economic contraction during this period, only one such bank could exist where before there had been many, and by any measure—capitalization, number of employees, or number of branches—that bank was smaller than the Bardi and Peruzzi houses of the early fourteenth century.

Barbato Da Sulmona

Barbato (c. 1300-1363) is known primarily for his friendship with some of the leading intellectuals of the *Trecento*. He was born in Sulmona (the exact date is not recorded), and Barbato was his Christian name—not his surname, as was erroneously supposed for many years. He qualified as a notary on 4 January 1325 and then began working at the Angevin court in Naples. In the course of his life he met many notable

scholars, of whom the most famous were Petrarch and Boccaccio.

Barbato and Petrarch first met when Petrarch visited Naples in the spring of 1341, and much of their correspondence has been preserved. Twenty-two of Petrarch's letters to Barbato are extant, and attached to one of them is a rare surviving example of Barbato's own writing, *Romana res publica urbi Rome*, probably composed in 1347. In addition, we have three letters from Barbato to Petrarch, and a fourth which was written by Barbato to Petrarch on behalf of Niccolò Acciaiuoli, Napoleone, and Nicola Orsini. Barbato also wrote a learned commentary on Petrarch's letter to Niccolò Acciaiuoli, *Iantandem* (*Familiarum rerum libri epistole*, XII.2). Barbato was instrumental in the manuscript tradition of Petrarch's writings, collecting them and diffusing them among the Neapolitan intellectual community, and Petrarch dedicated his *Epistolae metricae* to Barbato, perhaps in recognition of this.

Barbara's friendship with Boccaccio began in Naples in 1344. Three letters from 1362—one by Boccaccio and two by Barbara—are all that remains of their correspondence, but they demonstrate Barbara's lifelong devotion to Petrarch and are evidence of his search for further examples of Petrarch's writing. Boccaccio, in his letter, promises Barbara a copy of Petrarch's *Bucolicum carmen*.

Barbato died of the plague during the autumn of 1363.

Barberini Euchologium

A euchologium is a liturgical book containing the eucharistic formulas, sacramental rites, and other public prayers of the Greek church. For the Byzantine rite—representing the majority of that church—the oldest surviving example is the Barberini Euchologium in the Vatican Library (Biblioteca Apostolica Vaticana, Codex Barberinianus Graecus 336, folios 1-263), written in southern Italy in the second half of the eighth century. The Barberini Euchologium predates by many centuries the eventual definitive form of the rite, from which it differs in important respects. It is also the oldest document of the Italo-Greek liturgy celebrated in various forms throughout the Middle Ages and into the early modern period; thus it occupies a special place among the manuscript remains of Greek culture in medieval Italy. The Barberini Euchologium has long been known to scholars but has only recently received a modern critical edition.

Bardi Family

The Bardi, a Florentine family, ran one of the premier European banking houses in the late Middle Ages. In the twelfth century, members of the family moved from the vicinity of Antella to Florence and established houses near the Arno River along what is now Via dei Bardi. They were vigorous traders in wool and leaders in the Florentine Calimala guild, and they had an office in England perhaps as early as 1183. After 1234, their fortunes soared, and in 1263 four brothers, the sons of Buonaguida Bardi, established the family bank in Florence. Two years later they were lending to the pope.

The Bardi family was large, with many branches, and several members became prominent in politics during the thirteenth century. For example, Bartolo di messer Iacopo served in Florence's first priorate in 1282 and subsequently in 1283, 1285, 1286, and 1290. The Bardi's fortunes dipped after King Edward I of England sequestered their English wool stocks in 1290. However, in the 1290s, the Bardi established branches of their bank in Naples, Friuli, Udine, Cividale, Cremona, and Aquileia. They were declared magnates under the Florentine ordinances of justice (1293), and they feuded with a rival banking family, the Mozzi (1290-1295). Beginning in 1303, they served as *mercanti di camera* for the pope.

During the first third of the fourteenth century, the Bardi continually expanded their commercial and banking interests. In 1299, six brothers, sons of Iacopo di Riccio, and five other Bardi controlled the enterprises; and in 1310 there were fifteen partners, ten from the same family. In a good year, interest and dividends for investors would reach 13 percent. Along with their giant contemporaries the Acciaiuoli, the Frescobaldi,

and the Peruzzi, the Bardi supplanted earlier families as bankers to the monarchs of Europe. The rulers needed cash, and in exchange for it they would often grant monopoly rights to state export revenues. The Bardi controlled many such monopoly revenues—for example, wheat in Naples—and, along with the Peruzzi, they had a virtual lock on English wool exports under Edward III. Nonetheless, kings could be troublesome clients, and disaster struck in May 1339. Edward III had borrowed nearly 1,365,000 gold florins to finance a war against France, and he owed payments on 800,000 florins to the bankers. When the fortunes of war forced him to suspend payments, other debts were called in, there was a run on all the Florentine bankers, and the economy of Florence nearly collapsed. The banks were ruined, but thanks to state-imposed moratoriums and its own diverse resources the Bardi bank survived until its creditors seized its assets in 1346.

In November 1340, in the immediate aftermath of this disaster, the Bardi led other magnates in a rebellion against the popular government. They were defeated, and sixteen members of the Bardi family were banished from Florence. Because they gave support to Walter of Brienne, they were able to return to the city two years later; but when Walter refused to abrogate the Ordinances of Justice, the Bardi participated first in his overthrow and then in the oligarchical "fourteen" who ruled in his wake.

The Bardi had been the strongest political and economic force in Florence in the 1330s, and they retained much of their power even after the bankruptcy. In 1364, they numbered fifty-two households, and in 1377 they were denounced as a "great and arrogant family." Members of the Bardi family continued to serve in political and diplomatic offices, and several were professional podestàs. Others—such as Roberto, a theologian at Paris (d. 1349); and Bartolomeo, bishop of Spoleto (from 1320)—served the church. The family also patronized several Florentine churches; the famous Bardi Chapel in Santa Croce was decorated by Giotto.

Bari

Bari is today the second largest city of southern Italy, the major city of modern Puglia (Apulia), and the most important port on Italy's Adriatic coast. Its origins have been traced back to the Bronze Age, and its foundation has been attributed to Illyrian settlers. It was inhabited by a people called the Peucezi, who occupied the Adriatic coastal regions of Apulia by the time the Greeks penetrated the area. It came into Roman hands during the third century B.C., and because it was situated at a junction of major roads, it became an important municipality and commercial center during the Roman era, though it was subordinate to Brindisi as a port and as a focus for shipping directed to the eastern Mediterranean. Christianity was well established in Bari by 347, when the first mention is made of its bishop.

With the disruption of Roman rule in the fifth century, Bari became

first a part of the realm of the Ostrogoths and then, after Justinian's reconquest, part of the Roman-Byzantine regime. The Lombards under Authari seized Bari, but it was still strongly contested by the Byzantines, and it was sacked by Emperor Constans II in 669. Duke Romuald of Benevento (d. 687) held it briefly, only to lose it again to the Byzantines. Their rule over Bari was soon shaken, however. The Baresi opposed the new Iconoclastic policies of Emperor Leo III (c. 680-741) and rebelled against him; they then maintained their independence under a series of leaders (Theodore, Angelbert, and others). At this time Bari became the seat of the primate of Apulia, surpassing its rivals Brindisi and Taranto as an urban and ecclesiastical center. In early ninth century it was under the rule of its own duke, Pandone, who recognized a loose Byzantine suzerainty but then fell under the control of Duke Radelchis of Benevento. In the course of local struggles, African Saracens were drawn into the region, and in 847 Bari was stormed and was made the capital of an emirate—the only Islamic regime ever established on the Italian mainland, and a hint of what could have become a larger Saracen, or Arab, conquest.

In fact, however, the Saracen emirate, and whatever prospects it represented, lasted barely twenty-five years: in 871 it was besieged and taken by the Frankish emperor Louis II. When Louis died in 875, Bari again submitted itself to Constantinople, becoming the center of the restored Byzantine rule in southern Italy as the residence (from 893) of the *strategos* of the *theme* (military district) of Langobardia. During the Ottonian penetration of southern Italy, Bari was briefly taken by Otto I; but in view of the weakness of his son, Otto II, Bari was returned to Byzantine rule by 982, and it became the seat of a still higher official, the *katepano*, who commanded an enlarged complex of Byzantine territories (including Apulia and Calabria). At the same time, the Saracens continued to threaten Bari, and in 1002 a Sicilian force under Safi besieged the city, which resisted heroically. Relief came when the Venetian fleet, led by Doge Pietro Orseolo II, appeared at the request of the Byzantines and dispersed the attackers.

During these phases of Byzantine rule, Bari became a large and prosperous metropolis with a polyglot population and a cultural life enriched by Byzantine culture, and its maritime and mercantile elements benefited from their connections with the markets of

Constantinople. Nevertheless, with regard to religious loyalties, Bari's population remained staunchly western Catholic; and periodically, restless elements in and around the city made it a hotbed of resistance to the Byzantine government, which was considered oppressive. A climax came with a series of rebellions organized by the Lombard Melo, who was supported by local Lombard princes and by the German emperor Henry II. Melo's first venture (1009) failed. For his second attempt (1016), he called on Norman adventurers who were then appearing in Italy as mercenaries; but he was decisively defeated at Caninae (1018) by the energetic new Byzantine *katepano* Basil Boioannes, went into exile, and died in Germany.

Under Boioannes, Byzantine control was revitalized, though at the cost of recurrent wars with the Lombards of Benevento and with Saracen raiders. Bari was again a powerful urban center as seat of the katepanate, but the local populace remained resentful. After Boioannes died, this resentment was exploited by Melo's son Argyrus, who escaped captivity in Constantinople and fomented new rebellions in Italy. Argyrus, like his father, was aided by Norman mercenaries, and he was able to enter Bari, where he was acclaimed its duke. He was held in check during the harsh regimes (1037-1040, 1042) of the Byzantine commander George Maniakes. When Maniakes departed, in an abortive attempt to usurp the throne in Constantinople, Argyrus resumed his rebellion, but he now found himself pushed aside by his Norman allies, who were seizing territories for themselves. Argyrus soon crossed over to the Byzantine side, and in 1045 he went to Constantinople, where he became active at the court. Having gained the emperor's confidence, Argyrus was sent back to Italy as Byzantine governor and duke of Bari. He and his successors held the city in the name of Constantinople as the Normans proceeded to conquer more and more of southern Italy. Eventually, Bari was left as the Byzantines' last stronghold and was besieged for four years by the paramount Norman leader, Robert Guiscard. Starved into submission, it surrendered in 1071, completing the extinction of Byzantine rule in Italy. Guiscard ruled Bari through a deputy, and upon his death (1085) the city became part of the inheritance of his eldest son, Bohemond, although Bohemond's rule was challenged for a while by another son, Roger.

In 1087, some Barese sailors succeeded in stealing the relics of Saint

Nicholas of Myra from the church in Asia Minor where the saint had been buried, and carrying them off to Bari. The relics were entrusted to Abbot Elia of the Benedictine monastery and, after some dispute over where to place them, Elia (by then a bishop), with the patronage and support of Roger, began the construction of a new church dedicated to Nicholas, who was proclaimed the patron saint of Bari. At this time, the cult of Saint Nicholas was becoming ever more popular in the Christian west, and Bari became one of the most important shrines and pilgrimage sites in western Europe. (To this day, Bari has a huge annual festival celebrating this saint.) In 1098, in the newly completed crypt of the church of Saint Nicholas, Pope Urban II, who had recently preached the First Crusade (then still in progress), held a council aimed at reconciling the Latin and Greek churches. Saint Anseim of Canterbury was among the participants.

In addition to the pilgrimage to the shrine of Saint Nicholas, pilgrims on their way to the Holy Land in the wake of the crusades also passed through Bari, making it a major center of east-west transportation and a highly prosperous port. But the Baresi found the Normans' rule oppressive, and in the years following Bohemond's death (1109), the city again became a center of unrest and struggle. One of Bohemond's successors, Duke Grimoald of Bari, attempted to fend off the new Norman king, Roger II. In 1136, at the behest of the pope, the German emperor Lothair II took advantage of the confusion, seized the city, and occupied it briefly. Thereafter Bari went, tumultuously, through one form or another of Norman lordship until 1155. That year, in accordance with the will of the people, the city was handed over to the Byzantine emperor Manuel I, who was making a fumbling attempt to recover power in Italy. In 1156, in retaliation, the Norman king William I, "the Bad," besieged the city, stormed it, and razed it to the ground, sparing only the church and shrine of Saint Nicholas. A decade passed before the population regathered; the city was then rebuilt under William II, "the Good," and the upper part of the basilica of Saint Nicholas was consecrated by a papal legate.

From then on Bari recovered steadily as it passed from the rule of the Normans to that of the Swabian Hohenstaufen and entered a more stable period. However, its former turbulent autonomy was decisively reduced. Frederick II, doubtful about the city's loyalty but determined to ensure its strategic importance, rebuilt and expanded its commanding fortress and also built a new port. He also granted the city certain selected privileges, confirmed its episcopal status in the region, and instituted at Bari one of seven annual fairs that were to be held in

his kingdom.

Bari's revival, and its new prosperity, dissolved with the coming of Angevin rule. The Angevin sovereigns, selfish, quarrelsome, decadent, and exploitative, cared little for the interests of the city and sought only to extract from it what revenues they could. Commercial privileges were callously sold to wealthy merchants, and arrogant noble families flaunted their power with impunity. Worse still, the city became a pawn in conflicts between branches of the Angevin dynasty. Bari supported Queen Joanna I of Naples against Louis of Hungary, and as a result the city was besieged by an army of Hungarians and Germans and was forced to surrender (1349). After the war, Joanna ceded the city in turn to Robert of Anjou, prince of Taranto, and then (in 1364) to his brother Philip. It next fell under the rule of the rebellious Iacopo del Balzo, who was followed by Joanna's fourth husband, Ottone. In the ensuing struggle between two branches of the dynasty—Naples and Durazzo—Bari unwisely and futilely sided with the Neapolitans Louis I and Louis II and then suffered the vengeance of the victorious Durazzan faction. Under King Ladislas and even under Joanna II, Bari was granted some new rights and immunities, but these were abridged when, in 1430, Joanna again awarded the city in feudal grants in turn to Iacopo Caldora and his son Antonio. After a brief and unhappy period of Aragonese rule, Bari passed in 1464 into the hands of members of the Milanese Sforza family, including the widowed Isabella of Aragon. Under Isabella's reign (1500-1524) the city enjoyed one last, short period of revival, refurbishing, and cultural florescence.

As a consequence of its stormy history, virtually no traces of Bari's early medieval and Byzantine monuments survive in the modern city; there are only a few putative fragments of the palace complex of the Byzantine governor, adjacent to the church of Saint Nicholas, or San Nicola. But that church and the cathedral have made Bari a glorious, and influential, example of the Romanesque architecture of southern Italy.

The church of San Nicola is one of the four palatine basilicas of Puglia. It was the first great Norman church erected in southern Italy, and it became the model for Romanesque design in the region. It was begun by Bishop Elia, under the patronage of Duke Roger, on the site of the palace of the Byzantine *katepano*, and apparently it incorporates

some Byzantine fragments, especially in one or both of its facade towers. Elia built the crypt, which contains the saint's extensive burial shrine. This much was consecrated by Pope Urban II in 1089; in it, Peter the Hermit preached a sermon urging what became the First Crusade (1095), and (as noted above) Urban came here in 1098 to preside over a council. The initial phase of construction ended in 1108, three years after Elia's death. The barely finished church was spared devastation in 1156, and the upper church proper was completed in 1197, when the church was consecrated. Its exterior is severe in design but is graced on three sides by handsome portals decorated with sculptures of lions on the north side and bulls on the south side and the western facade. Inside, the church's treasures include a superb *ciborium* (c.1150), the oldest preserved in Puglia; and an episcopal throne that is said to date from Urban II's council in 1098. The crypt, with the saint's elaborate tomb (from which miraculous unguent or *manna* is still believed to flow), is decorated as befits an important pilgrimage site. The shrine includes a fine Byzantine icon, given in 1319 by the king of Serbia. At the altar complex, provision is made for the celebration of the Byzantine rite, in partnership with the Latin rite; Bari is one of the few places in Italy where this is allowed.

The cathedral, dedicated to San Sabino, is modeled closely on San Nicola but is on a grander scale; it is a noteworthy example of Apulian Romanesque design. It replaced a series of earlier episcopal churches dating from early Christian times to the Byzantine era. Its immediate predecessor had been given its own definitive form by Bishop Bisanzio in the years 1035-1064, but that structure was all but totally destroyed in 1156 by William I. The present cathedral was constructed on its ruins in 1170-1178 but was not formally consecrated until 1292. Like San Nicola, the cathedral is a basilica in plan, though it is surmounted by a large cupola within an octagonal drum. On the exterior of the east wall, outside the altar, is a magnificently sculptured apsidal window. The austere interior is graced by a reconstructed *ciborium* of 1233. At the end of the north wall is a cylindrical structure called La Trulla, which is now used as a sacristy but was originally the baptistery of the eleventh-century church. Modern excavations have revealed extensive survivals of early mosaic pavement, dating from the eighth and ninth centuries. The cathedral archives preserve some important liturgical manuscripts,

including the famous *Exultet* roll, a Byzantine paschal scroll of the early eleventh century.

Adjacent to San Nicola is the city's third important medieval church, San Gregorio, which is small but handsome. It was originally built in the early eleventh century, was probably gutted in 1156, and was rebuilt to some extent between the late twelfth century and the thirteenth century, in Romanesque style.

Another important monument in Bari is the massive Hohenstaufen castle, at the western corner of the medieval walls. The castle, which incorporates earlier Byzantine and Norman elements (eleventh-twelfth centuries), was essentially built by Frederick II, with amplifications by Isabella of Aragon. Here, according to tradition, Frederick received a visit from Saint Francis of Assisi. The castle is now used as a museum and exhibition center. Adjacent to it is Bari's *centra storico* (historic center). In general, although the *centro* has lost most of its actual fortification walls, it still preserves its medieval configuration—a warren of narrow, twisting streets that are said to have been made so complex deliberately, in order to baffle and frustrate attackers.

Barlaam

Barlaam the Calabrian (Bernardo Massari, c. 1290-1348 or c. 1350) was born at Seminara in Reggio Calabria and was probably educated at one of the Greek Orthodox monasteries in the region, which were important centers of Greco-Latin studies. Having entered the priesthood, he left for Constantinople sometime around 1326 or 1327. From 1331-1332 on, Barlaam also seems to have lived intermittently at Thessaloniki.

Barlaam's lectures on mathematics (he wrote on arithmetic, astronomy, acoustics, and music) and philosophy (a treatise by him on Stoic ethics is preserved) soon made him very successful in the Greek capital. Apparently, his success aroused the envy of Niceforus Gregoras, who was then the prime representative of Byzantine humanism. Barlaam's training in Latin scholastic theology proved to be an important asset in 1333: he was chosen to defend the Greek position in discussions related to a reconciliation with Rome, which was desired by Pope John XXII. Bar laam's agnostic-nominalist position, however, drew criticism, both from the nominalist papal representatives and from several Greek colleagues such as the Hesychastic monk Gregory Palamas. Barlaam later disputed with Gregory on the value of the contemplative techniques practiced by the Hesychasts, and in 1338 this dispute developed into a discussion of the value of scholastic theology versus mystical contemplation. In 1341, the debate culminated in a general council at Constantinople, where Barlaam was forced to refrain from any further attacks on Hesychasm or Palamite theology.

In July 1341, after the death of Emperor Andronicus III, Barlaam chose to return to Italy and France. Earlier, at the beginning of 1339, Andronicus III had sent Barlaam on a mission to Naples, Paris, and Avignon to seek support for a crusade against the Turks. Thus when Barlaam came back to the west, he had a circle of patrons and friends eager to extend him hospitality. It was at Avignon that Barlaam first

made the acquaintance of Petrarch (Francesco Petrarca), to whom he began teaching Greek in 1342. With the help of this pupil, Barlaam acquired the Calabrian bishopric of Gerasa. In 1346, he was charged with an ecumenical mission to Constantinople, but owing to the influence of Palamas, the mission failed. Barlaam returned to the papal court at Avignon, where he remained until his death on 1 June 1348.

Bama Da Siena

Barna (Berna da Siena, fl. c. 1330-1350) was a Siennese painter active in Tuscany during the second quarter of the *Trecento*. On the basis of the style and quality of the art currently associated with him, he was among the most accomplished of Simone Martini's followers and colleagues. Barna's artistic reputation traditionally rests on his contribution to the great fresco cycle *Episodes from the Infancy and Passion of Christ* in the Collegiata of San Gimignano, painted in the late 1330s or 1340s by a team of three or four masters. His precise historical identity is controversial, however, since current critical opinion is that his name is fictitious. A painter called Barna Bertini was recorded in Siena in 1340, but he is not thought to be the same artist who participated in creating the cycle in San Gimignano.

The "Barna Question"

Barna was first mentioned by Lorenzo Ghiberti in *I commentarii* (c. 1447-1455) in connection with a series of mural paintings on Old Testament subjects to be found in an unspecified church in San Gimignano; today these paintings are identified as the Old Testament cycle on the left aisle of the Collegiata. However, those frescoes were

executed by Bartolo di Fredi Cini by 1367, and it has been suggested that "Barna" is simply Ghiberti's misreading of "Bartolo." Despite his Florentine background, Ghiberti was particularly sensitive to the achievements of Sienese painting, and he praised the artist he knew as Barna, who he claimed had also been active in Florence and Cortona.

Giorgio Vasari included Ghiberti's observations in his first edition of *Vite* (1550), but by the second edition (1568), "Berna," as Vasari refers to him, is said to have painted New Testament rather than Old Testament narratives in the *pieve* of San Gimignano—where, as Vasari goes on to relate, the painter's career came to an abrupt end in 1381, when he was killed in a fall from some scaffolding. Vasari increased the painter's corpus, of which nothing survives today except the frescoes in San Gimignano, and extended his sphere of activity to Arezzo and Siena. Some scholars have suggested that Vasari, while preparing his later edition of *Vite*, became aware of that Bartolo had created the Old Testament frescoes and therefore associated Ghiberti's Barna with the only other great fresco cycle in the church, the New Testament scenes on the opposite wall or right aisle of the Collegiata. In the process, Vasari, influenced by Ghiberti's incorrect testimony, would have unknowingly invented the name of a painter. If this was indeed the case, then the late date of 1381 that has traditionally been associated with the execution of the frescoes can be ignored, since the chronology is not only untenable on stylistic grounds but is also contradicted by the known circumstantial evidence, which indicates that the authorities of San Gimignano were starting to organize the decoration of the church in 1333.

Episodes from the Life of Christ

Among the frescoes that fill the six bays of the right aisle of the Collegiata are the deeply expressive narratives that are for, convenience, still linked to Barna. The narrative is subdivided into three registers—the early life of Christ at the top, his ministry in the middle, and his passion below—and unfolds in a horizontal sequence from bay to bay. Equally important, however, is the vertical linkage (e.g., the first arrival of Christ in the *Annunciation* was planned above Christ's

second arrival in the *Entry into Jerusalem*), which expands the overall meaning of the frescoes. Building on the example of the passion cycle from Duccio's *Maestà* for the cathedral in Siena, Barna also exploited changing rhythms within the narrative pace by increasing the scale of a scene, as in the monumental *Crucifixion* that fills two registers of a whole bay, or by allocating two compartments to a single event, as in the *Entry into Jerusalem*.

Problems with authorship and collaboration notwithstanding, the style of many of these scenes is characterized by elongated figures with dramatic facial expressions and agitated movements. Often sacrificing descriptive naturalism for general expressive effect, Barna's compelling works echo the art of Simone Martini, whose designs of elegant human forms punctuated with a refined sense of color were reinterpreted by Barna with an altogether sharper emotive force.

Bartolino Da Padova

The composer Bartolino da Padova (fl. c. 1400) was a member of the final generation of *Trecento* musicians. He was born in the later fourteenth century and died in the early fifteenth. We know little of his life beyond the fact that he was a Carmelite monk, and he has sometimes been identified with one or another of the Paduan Carmelites called Bartolomeo. There are clues that he served the Cararra family of Padua at some points between 1365 and 1405, and it has been asserted that he may have spent some time (1388-1390, or after 1405) in Florence. Some of his works are said to reflect the Florentines' antagonism toward the Visconti.

Thirty-eight works, all with Italian texts, survive as Bartolini's accepted legacy. They are preserved in the famous Squarcialupi Codex, which includes his portrait. There are twenty-seven *ballate* and eleven madrigals, mostly in two vocal parts. Bartolini's music represents a relatively conservative continuation of the earlier *Trecento* tradition, with particular links to the work of Jacopo da Bologna.

Bartolo Di Fredi Cini

Bartolo di Fredi (fl. 1353; d. Siena, 1410) was one of the most active Sienese painters of the second half of the fourteenth century. He produced numerous altarpieces for the churches of Siena and the surrounding territory, as well as major altarpieces and fresco cycles in the neighboring towns of San Gimignano, Montalcino, and Volterra. Like other Sienese artists of his time, Bartolo is known to have participated actively in Siena's political life. He not only executed major commissions for the Sienese commune—for instance, a view of Montalcino (now lost) painted in 1361 for the council chamber of the Palazzo Pubblico—but also served in civic office. In 1380, he was a member of the Opera del Duomo, the civic authority in charge of the decoration for the cathedral of Siena.

Much of the recent literature on Bartolo di Fredi has been devoted to the reconstruction of his altarpieces. As Freuler (1994) has shown, Bartolo was a painter who adapted creatively to the circumstances of his commissions, producing innovative structural and iconographic solutions. His style, which he also adapted to fit the circumstances, is generally situated between, on the one hand, the lyrical naturalism of Simone Martini and Martini's followers and, on the other hand, the highly abstracted lyricism of such great fifteenth-century Sienese painters as Giovanni di Paolo. Bartolo's narrative manner developed in close contact with the painters of Simone Martini's circle, including

Lippo Memmi, who were working at San Gimignano just before the mid-fourteenth century. The Old Testament cycle that Bartolo painted in 1367 for north wall of San Gimignano's Collegiata—facing a New Testament cycle that has been variously attributed to Barna da Siena and Lippo Memmi—is remarkable for its decorative animation. In mature works like the Adoration of the Magi painted in the late 1380s for the Tolomei chapel in the cathedral of Siena, subtle harmonies of color and line are balanced with vivid characterizations to produce a highly abstracted but compelling narrative.

Bartolomeo Da Brescia

Bartolomeo (d. 1258) studied canon and civil law in Bologna; his masters were Tancredi da Bologna in the former and Ugolino de'

Presbiteri in the latter. He himself remained active in Bolognese legal circles until he was slain in Ezzolino da Romano's sack of the city.

Bartolomeo wrote several works. The earliest (c. 1234) was *Brocarda*, updating Damasus's expositions of legal rules with references to the *Decretals* of Gregory IX. He later wrote *Casus* (paraphrases) and *Historiae* (notes on biblical and historical references) for the *Decretum* of Gratian, as a guide to readers; and a work on legal procedure updating that of Tancredi. Bartolomeo also left two collections of legal questions. He is best-known for his revisions of Johannes Teutonicus's *Ordinary Gloss* on the *Decretum*, the version that was most often transmitted with the text well into modern times. He added references to the Gregorian *Decretals* and other papal decrees that were then recent, and occasionally contradicted Teutonicus.

Bartolomeo Da Capua

Bartolomeo (d. 1328) studied at the University of Naples, where he received his doctorate in 1278 and taught until 1289. His father, a jurist, had served both the Hohenstaufen and the Angevins; Bartolomeo served Charles I of Anjou and his son, Charles II. The latter made Bartolomeo a leading judicial official and an envoy to popes and princes. Bartolomeo defended the right of Robert of Anjou, the son of Charles II, to succeed his father and died in Robert's service. Bartolomeo's legal works include glosses on the laws of the kingdom of Naples, some of which he had drafted, and comments on civil law.

Bartolomeo Da San Concordio

The learned Dominican Bartolomeo (1264-1347) was born in San Concordio, near Pisa; studied law and theology in Bologna and Paris; and returned to Italy to teach in the schools of the Dominican order in Rome, Florence, Arezzo, and Pistoia. Around 1312, he settled in Pisa, where he was assigned to the *studium* of Saint Catherine; he became its director in 1335. Bartolomeo was much admired by his contemporaries for his erudition and his prodigious memory and is most interesting to modern scholars for his prehumanistic interests and his translations.

Bartolomeo wrote or is said to have written various minor works (not all are of certain attribution): *Compendium moralis philosophiae*, *De mernoria*, *De arte metrica*; and comments on Virgil and Seneca. He was also the author of an interesting work called *Documenta antiquorum*. Its essentially pedagogic moral tone and construction are based on teachings by Thomas Aquinas, Jerome, Boethius, Isidore, and Gregory; besides these figures, there are a great number of classical Latin authors (Virgil, Cicero, Horace, Ovid, Seneca, Terence, etc.) who may constitute the artistic center of the work.

Around 1305, Bartolomeo himself translated his work into the Florentine vernacular: *Ammaestramenti degli antichi* (*Teachings of the Ancients*) was one of the most popular *volgarizzamenti* (vernacular translations) of the early fourteenth century because of its moderate and balanced treatment of sins, virtues, and fortune. The Italian of this translation is elegant and effective, and it prepared the way for the two translations for which Bartolomeo is justly famous today: Sallust's *Catilinario* and *Giugurtino*, both completed by 1313. Sallust, a historian and moralist of civil life, offered themes that were appropriate for the *comuni* (communes), but his complex Latin had made him inaccessible to many readers before Bartolomeo's translation. Bartolomeo was fully

aware of the challenge of translation (the mature prologue is proof of his preoccupation with style), and he imitated the tightness of the Latin prose successfully (and uncommonly, for medieval Tuscan tended to be verbose). At the same time, he was not afraid to take liberties when his expressive vein called for them. Thus these translations, aside from their inherent beauty and interest, provided a useful and important model for later prose works and contributed to the spread of knowledge of Rome and the classical world. During the Middle Ages, however, Bartolomeo was best known for *Summa de casis conscientiae*, which remained the most important confession manual for more than a century.

Bartolomeo died in Pisa.

Bartolus of Sassoferrato

Bartolus (1313 or 1314-1357) was the most influential expert on civil law in Italy during the *Trecento*. He was born near Sassoferrato in the territory of Ancona to a prosperous rural family, was tutored by Fra Pietro d'Assisi, and entered the University of Perugia c. 1328. He studied civil law under Cino da Pistoia, absorbing both the French critical

methods of legal exegesis developed at Orleans and the Bolognese forensic dialectic methods. At Bologna, Bartolus studied under Iacopo Butriga rio, Oldrado da Ponte, and Raniero Arsendi da Forli; he earned his baccalaureate degree in 1334 and his doctorate in law in 1335. Between 1336 and 1339, Bartolus served as a legal assessor for several communities, including Todi, Cagli, Macerata, and finally Pisa, where he was also appointed to the law faculty of the university in late 1339 at an annual salary of 150 gold florins. In 1343, he returned to Perugia, where he taught at the university until his death. He was made an honorary citizen of Perugia in 1348, partly in recognition of his contributions to the city and also partly in the hope that he would remain there despite lucrative offers from elsewhere. His work helped the law school at Perugia rise to rival Bologna itself as a center of legal education.

Bartolus brought to his work as a civil jurist an enormous knowledge of customary, feudal, civic, canon, and civil law; clarity, practicality, and realism in the application of legal principles; and an unflinching dedication to displaying and disseminating his scholarship—though modern scholars still dispute the authorship of several works attributed to him. He wrote commentaries on all parts of the *corpus juris civilis* (which fill nine of ten volumes in the 1590 edition of his works), 405 legal opinions on specific cases, and a wide range of treatises on private, public, criminal, and civil law. Through his teaching and scholarship he sought to bring the legal systems of his time into line with the code of Justinian, and to adapt that code to contemporary problems and conditions, a task begun by Cino da Pistoia. In public law especially, Bartolus endeavored to shift the field of debate and development from philosophy (or theology) to Roman law and the realities of the fourteenth century. He shared those goals with his contemporaries, the "postglossators" or "commentators." However, these other commentators tended to rely heavily on the authority of earlier glosses of civil law, weighing conflicting arguments in search of a just solution, whereas Bartolus usually began at that point but then went beyond it, often arguing with earlier interpretations and relying on other authorities.

These tendencies appear most clearly in Bartolus's treatises. In *On the Government of a City* he depended in part on an essentially Aristotelian analytical framework (from *Politics*), adding his own comments on the

seventh form of government: the "monstrosity" that was contemporary Rome. In *On Rivers* he relied heavily on Euclid and incorporated diagrams and geometric figures to present his reasoning, a method he himself considered novel. In *An Action between the Devil and the Virgin Mary* Bartolus explored the procedural problems of having a female—let alone the mother of Christ the judge—serve as advocate for the plaintiff, mankind, in a suit for possession brought by the devil: an example of a teacher's whimsy highlighting serious juridical matters.

Much of Bartolus's practical legal work also involved canon law, as this system governed the political relationships of the papal states and any interactions of the church with the broader society.

The treatise *On Tyranny* clearly demonstrates Bartolus's concern for contemporary Italian politics as well as political theory; in this work he draws tacitly from current events in a way that anticipates the method of Machiavelli's *Prince*. Here Bartolus formulated the first "theory of popular sovereignty to accommodate the political reality of independent city-republics." The *populus liber* (free people) of the city need not recognize the higher authority of an imperial or feudal lord, having unto itself the same authority in its jurisdiction that the emperor has in his: an extension of the idea that a king is emperor in his kingdom (*civitas sibi princeps*). This freedom could be obtained either *de iure* from the emperor or *de facto* through usurpation and declaration. Bartolus, equating lordship with tyranny, disdained the *signore* and the town that accepted a *signore*.

Bartolus combined profound legal and jurisprudential understanding with clarity in the application of this wisdom to the problems of his own era—a combination which ensured that he would leave deep and long-lasting impression. Through his writings and his students, such as Baldus de Ubaldis, his opinions and commentaries became authoritative and remained so for more than a century, despite attacks from humanists who favored a more purely historical approach to Roman law. In the law schools of Pisa, Naples, and Padua, *Bartolismo* continued to shape legal science into the seventeenth century.

Belisarius

Belisarius (c. 505-565), one of history's greatest generals, was born in the Balkans, but otherwise his origins are unknown. He first attracted attention while serving in the bodyguard of Emperor Justinian I and was advanced to a high command while still in his mid-twenties. He demonstrated his capacities with some brilliant successes against the Persians on the Mesopotamian frontiers, and then earned the emperor's further esteem by helping to suppress the bloody "Nika riots" that threatened Justinian's regime in 532. By this time, Belisarius was married to Antonina, a friend of Empress Theodora; Antonina's conduct was often a trial to him, but her influence at court became vital. When Justinian began an ambitious attempt to recover Roman imperial territories from barbarian regimes in the west, first by attacking the Vandal kingdom of North Africa, Belisarius was the logical choice to command the expedition. Leading a small force and displaying the bold resourcefulness for which he became famous, Belarius destroyed the Vandal forces in two lightning victories and conquered the North African realm within a few months (533-534).

Justinian next turned toward Ostrogothic Italy, and in 535 Belisarius was sent to begin recovering it. In the ensuing Gothic wars, he quickly seized Sicily and moved northward on the mainland to suppress resistance in Naples; not until he occupied Rome did he face a serious counter-effort under the new Gothic king, Witigis. In Rome, Belisarius effected the deposition of Pope Silverius, who had been elected through the influence of the Goths, replacing Silverius with Theodora's candidate, Vigilius; Belisarius also brilliantly fended off the Ostrogoths'

siege of the city (537-538). For a while, his progress further north was delayed by dissension among his subordinates, but by 540 he had bottled up Witigis in the latter's capital, Ravenna. Pretending to entertain their suggestion that he become emperor in his own name, Belisarius won the surrender of the Ostrogoth leaders, but in the process he incurred Justinian's suspicion. As a result, Belisarius was recalled in disgrace to Constantinople. He was saved by his wife's influence and was returned to hard duty on the Persian frontier.

Meanwhile, the incompetence of Belarius's successors in Italy and the smoldering resentment of the remaining Ostrogoth leaders resulted in a furious renewal of war in the peninsula. Justinian then dispatched Belisarius back to Italy to resume command and conduct the war, but without forces and resources sufficient to the task. Belarius did his best, applying his old resourcefulness, and briefly recovered Rome; but he could not achieve any lasting results against the energetic Ostrogothic king, Totila. The death of Theodora in 548 deprived Belarius of his last support at court, and so, at his own request, he was recalled to Constantinople to enjoy his accumulated wealth in retirement, leaving the final reduction of Ostrogothic Italy to his eventual replacement, the general Narses.

Eleven years later, when raiding Huns threatened the capital, Belisarius was called out of retirement to drive them off—which he did, as much by stratagem as by force. Justinian, who was still suspicious, accused Belisarius of participating in a plot against him. The emperor stripped Belarius of his wealth but did not (as later legends recounted) blind him and send him, an aged beggar, into the streets where once he had ridden in triumph. Belisarius died in March 565, only months before his ungrateful sovereign.

Bencivenni, Zuccherò

The Florentine notary Zuccherò Bencivenni (fl. 1300-1313) is an interesting intermediary in the transmission of Latin scientific texts from French into Italian. The medical books of the Persian physician and philosopher Rhazes (Razi, c. 865-923 or 925) had been translated into Latin by Gherardo da Cremona, but Bencivenni probably translated them into Italian from a French version. Around 1310, he translated Aidobrandino da Siena's popular *Regime du corps*; this translation is known under various titles, one of which is *Ammaestramenti a conservare la sanità del corpo* (*Teaching on Preserving the Health of the Body*). A whole succession of scientific and pseudo-Aristotelian works are attributed—many surely falsely—to Bencivenni; they include a series on physiognomy, astronomy, and lapidary. His most popular work was a translation of Brother Laurent's *Somme le roi*, a long and noteworthy work of moral philosophy; the translation, *Trattatello delle virtù* (*Little Treatise on Virtue*), was certainly familiar to many medieval readers. Bencivenni's texts are written in a gallicized Florentine that testifies to the influence of French culture and styles, typical of the late thirteenth century; it is also evidence for the author's presumed residence in France after his ascertained presence in Avignon in 1310.

Benedict of Nursia, Saint

Saint Benedict of Nursia (c. 480-547) was a monk and abbot, and the author of a rule for cenobitic monks; he was venerated as the patriarch of western monasticism from the eighth century on and was declared patron of Europe by Pope Paul VI in 1964. Pope Gregory the Great (c. 540-604) wrote an account of Benedict's life and miracles, probably within fifty years after Benedict had died; Gregory dedicated the whole of Book 2 of his *Dialogues* to the saint and identified as his sources four abbots who had access to traditions concerning Benedict and who may have been Benedict's disciples. Although Gregory wrote primarily as a hagiographer, the text is thought to contain reliable biographical information.

Benedict was born near Spoleto in the Apennine village of Nursia. He was sent to Rome for his education but was scandalized by the immorality of the city and fled to a cave near Subiaco, in the hills east of Rome, to live as a hermit. There he underwent the trials and tribulations that prepared him to teach others the way to God. After a failed attempt to institute his ideas at Vicovaro (where the monks attempted to poison him), Benedict returned to Subiaco; there, he succeeded in founding a large community of cenobitic monks, divided into twelve small colonies, all under his direction.

Eventually Benedict left Subiaco for Monte Cassino, halfway between Rome and Naples, where he remained until his death. Here he

established a cenobitic community, evangelized the surrounding countryside, and wrote the monastic rule for which he is renowned. In Gregory's *Dialogues*, Benedict is depicted at this time as a man of God at the height of his powers; through a series of accounts of miracles, Gregory emphasizes the saint's power as a prophet and wonder-worker. Benedict died at Monte Cassino and was buried in the same tomb as his sister Scholastica, a consecrated virgin. Before his death, Benedict predicted the destruction of Monte Cassino, though without loss of life.

In Book 2 of the *Dialogues*, Gregory declares that Benedict wrote a monastic rule "remarkable for its discernment and its clarity of language." *Regula Sancti Benedicti* (hereafter, *RB*) is generally accepted as the rule to which Gregory was referring and as having been written by the Benedict he celebrated. To be appreciated properly, *RB* must be understood in the context of some thirty Latin cenobitic rules written in the west or translated and introduced to the west between the years 400 and 700. Almost all of them draw their directives for asceticism and the common life from the same biblical texts and interpret these texts in the same way. The important virtues treated in the cenobitic rules include humility, obedience, charity, and patience; the essential observances are fasts and vigils, common ownership, work, silence, *lectio divina*, and frequent if not continual prayer.

Saint Benedict. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 144r.

RB, written between 530 and 560, is divided into three parts: a spiritual directory (Prologue and chs. 1-7); an institutional and disciplinary section (chs. 8-67); and an appendix treating fraternal relations, concluding with an epilogue (chs. 68-73). Most, though not all, scholars assume that *RB* was dependent on a long anonymous *Regula magistri* dated to 500-530 (hereafter, *RM*). Of the three parts of *RB*, only the third (the last) is unique; the spiritual part of *RB* is found almost word for word in the first ten chapters of *RM*, and in the institutional

and disciplinary part *RB* and *RM* follow parallel paths.

In the spiritual directory of his rule, Benedict identifies the abbot as the spiritual father and chief teacher of the monk; the abbot's role is to guide the monks to God by inculcating the three basic monastic virtues: obedience, silence, and humility. The abbot leads his monks to replace self-will with the will of God, and to supplant fear with love. The rule then applies these principles to the practical aspects of the communal life: prayer together and in private, disciplinary measures, food and drink, sleep, clothing, ownership of property, care of the sick and the young, work, and the formation of novices. The final chapters are concerned with relations among the members of the community, emphasizing horizontal (or lateral) relationships rather than the vertical relationship that is the focus of the spiritual directory.

The great merit of *RB* is that it offers, for those seeking God through the monastic way of life, a quite faithful and complete image of the cenobitic tradition. However, it does not appear to have met with any great early success in Italy. It makes its first appearance not in Rome, where the monks fled after the destruction of Monte Cassino c. 570, but elsewhere, and considerably later: in southern Gaul c. 620-630 and in England c. 660. In the seventh and eighth centuries, *RB* was used alongside the rule of Columban and was propagated through a network of Columbanian foundations in northern and eastern Gaul. As part of Charlemagne's program for the unification of his realm and the continuation of this ideal by his son Louis the Pious, *RB* was imposed on all religious communities that aspired to be called monastic; in this way, *RB* became the standard for much of Europe. *RB* does not reappear in Italy until the tenth century, when it was brought to the monasteries of Rome through the reforming activities of Odo of Cluny.

Evidence for a cult of Saint Benedict dates from the eighth century both in Italy and in France. Benedict was venerated at Monte Cassino after its restoration in 720; his tomb there became a place of pilgrimage, and his feast was kept on 21 March, the traditional date of his death. According to another tradition from the eighth century, his relics were removed shortly before 700 to the abbey of Fleury in France, where his feast was kept on 11 July to commemorate this translation.

Benedict XI, Pope

Niccolò Boccasini (1240—1304) reigned as Pope Benedict XI from 22 October 1303 to 7 July 1304. He was born in Treviso, the son of a notary, and joined the Dominicans in 1254. After studying theology in Venice and Milan, he was appointed a lector for the order in 1268. From 1282

to 1296, he was provincial of Lombardy; in May 1296 he was elected master-general.

Niccolò was a strong supporter of Pope Boniface VIII, who rewarded him by making him a cardinal in 1298. He continued to support Boniface throughout the pope's struggle with King Philip the Fair of France and was one of only two cardinals who remained with Boniface when a French army stormed the papal palace at Anagni in 1303. On his election as Boniface's successor, Benedict XI immediately excommunicated Pierre Nogaret and Sciarra Colonna, the leaders of the attack at Anagni. However, Benedict soon sought peace with the French. He temporized with regard to the assertions Boniface had made in the bull *Clericis laicos* (1296), obtained Philip the Fair's submission, and removed the censures Boniface had imposed on the king.

Benedict XI died suddenly while considering the case of Nogaret and Colonna, a circumstance that aroused suspicions of foul play. During his lifetime he had a reputation for holiness, and soon after his death a cult developed. He was beatified in 1736.

Benedict XII, Pope

When Pope John XXII died in Avignon in 1334, Jacques Fournier (1285-1342), a Cistercian and a former inquisitor, was elected pope: he

reigned as Benedict XII from 1334 to 1342. The new pope inherited John's quarrels with Louis of Bavaria and with dissident Franciscans. He quickly put an end to the controversy surrounding his predecessor's unacceptable opinions about the doctrine of the beatific vision, and he focused his own energy on reform. He curtailed abuses in the curia, causing dissatisfaction in Avignon; and he pressed religious orders, including the Dominican friars, to reform themselves. The Benedictines, once just a scattered family, were led to centralize their communities as an order. Benedict condemned the Spiritual Franciscans and the Fraticelli, but he tried—though in vain—to make peace with Louis. Benedict's policy in Italy was pacific: he conciliated the Visconti of Milan and the Delia Scala of Verona. The peace-loving and parsimonious Benedict had less success dealing with the tyrants who dominated portions of the papal states, especially Romagna and the March of Ancona. His successor, Clement VI, would resort to costly wars instead, but with equally little success. Unkind comments by unhappy curialists have damaged Benedict's reputation; and William of Ockham (or Occam), the leading theologian among the dissident Franciscans, who had been hostile to John XXII, was equally hostile to Benedict.

Benedictine Order

When Benedict of Nursia (c. 480-c. 550) wrote his *Regula monachorum* and founded the monasteries of Subiaco and Monte Cassino in the second and third quarters of the sixth century, he did not intend to found an order as we understand it now. Indeed, there is no record that Benedict's rule was followed anywhere else aside from these monasteries, except perhaps at the foundation Benedict made in Terracina, as Gregory the Great (c. 540-604) says in his *Dialogues*. But because this rule was a quite faithful and complete image of the cenobitic monastic tradition, emphasizing fraternal communion in love and the withdrawal of the legislator in favor of the living authority of the abbot, it was to have a preponderant influence on Latin cenobitism. Beginning in the seventh century, together with the rules of Columban (d. 615), it was imposed on numerous monasteries in the Frankish territories. At the end of the eighth century it became, at least in theory, the exclusive norm for all monks in the Carolingian empire.

In Italy, however, Benedict's monasteries and the observance of his rule barely survived him. Monte Cassino was destroyed sometime during the Lombard invasion, possibly c. 580, and tradition has it that the monks fled to Rome, taking the rule with them. If the tradition is correct, this copy of *Regula monachorum* was probably the same one that was still in Rome c. 750 and was sent by Pope Zachary (r. 741-752) to the recently revived Monte Cassino; and it may have been the copy that was sent to Charlemagne (c. 742-814) to serve as the fundamental document for implementing his program of uniformity of monastic observance. The "Roman rule" could best serve the Carolingians' design for an empire based on the Roman-German axis.

Although the monastic reforms of Charlemagne, Louis the Pious (778-840), and Benedict of Aniane (c. 750-821) were never extended to Italy, the Italian monasteries of Monte Cassino, Farfa, and San Vincenzo al Volturno had already begun a renaissance of their own. About 717, Petronax of Brescia restored Monte Cassino, making it the model monastery of Europe and a center for the diffusion of Benedict's *Regula monachorum* beyond the Alps. Willibald of Wessex lived at Monte Cassino from 729 to 739 before becoming bishop of Eichstat; and Sturm, the first abbot of Fulda, was trained at Monte Cassino in the observance of the rule. Carloman, brother of Pepin the Short, retired to Monte Cassino after his abdication in 747, to be joined by the Lombard

king Ratchis in 749. Farfa was destroyed by the Lombards in the sixth century but was restored by Thomas of Farfa in 690. Under Frankish abbots it was fortified; it was endowed by dukes, kings, and emperors; and its domains stretched from Latium to the Marches. Charlemagne made it an imperial abbey. San Vincenzo al Volturno, founded in 703, grew rapidly in importance, extending its rule over an extensive territory and becoming a virtual monastic duchy. Later, however, the Saracens destroyed Monte Cassino (in 884) and Farfa (in 882) and occupied San Vincenzo al Volturno (in 891).

Odo of Cluny (c. 879-942), who was called to Italy by Alberic in 936 to reform all the monasteries under his jurisdiction, brought Benedict's *Regula monachorum* to the monasteries of Rome (Sancta Agnes foris Muros, Santa Maria in Aventino, Sanctus Laurentius foris Muros, and Sanctus Paulus), to Monte Cassino, and to Subiaco. Odo also brought the Cluniac ideal, which was characterized by centralization and uniformity of observance, the development of ritual, a monastic culture based on study of the scripture and of the church fathers, extensive almsgiving and relief of the poor, and a flourishing of the arts, especially those of the scriptorium.

In the eleventh and twelfth centuries, new ascetic movements came into being; their adherents expressed discontent with the traditional Benedictine way of life, with the Benedictines' corporate wealth and involvement in worldly affairs, and with Benedictine community life, which was burdened by vocal prayer and ritual. The new ascetics, seeking disengagement, solitude, poverty, and simplicity, turned to the eremitic life of the desert fathers as their model. They included Romuald (c. 950-1027) at Sant' Apollinare in Classe near Ravenna, Peter Damian (1007-1072) at Fonte Avellana, and John Gualbert (d. 1073) at San Miniato in Florence.

It must be emphasized, though, that however strong the pull of the desert may have been for individuals in northern and central Italy, many of the established monasteries also reached their apogee during this period and in the twelfth century; and much of Italian monasticism, especially in the north and in the south, experienced a renewal under the influence of transalpine monastic reforms. The order of Cluny controlled some forty monasteries in Lombardy, most notably San Maiolo in Pavia, San Giacomo of Pontida (1076), and San Benedetto of

Polirone (1077). The abbey of La Chaise-Dieu possessed twelve monasteries in the north. The reform of William of Dijon spread from his foundation at Fruttaria in the early twelfth century to Sant' Ambrogio in Milan and Sant' Apolinare Nuovo in Ravenna. In the south, the congregation of Cava, following the Cluniac observance, was begun with the support of Pope Gregory VII (r. 1073-1085). By c. 1025, this congregation numbered forty abbeys, thirty-five priories, and sixty-five churches; eventually, it would grow to seventy-seven abbeys, 100 priories, and 400 churches.

Abbey of Monte Cassino. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 144r.

Many of the great houses flourished as never before. Monte Cassino reached the peak of its prosperity under abbots Desiderius (who was

abbot from 1058 to 1087 and later became Pope Victor III) and Oderisius I (from 1087 to 1105); during this period its church was consecrated (in 1071) and the fame of its scriptorium was established. During his abbacy (997 or 998–1038), Hugh introduced the Cluniac reform to Farfa and made the abbey a spiritual, intellectual, and economic center. The monastery of Subiaco flourished from 1050 to 1150, especially under abbots Humbert (1050-1069) and John V (*Gloriosissimus abbas*, 1069-1121).

Italian monasticism in the central Middle Ages was characterized by an astonishingly rich variety of forms and observances, equaling or even surpassing French monasticism. All the nuances of monasticism existed in Italy—local monasteries, reformed or unreformed; Cluniac priories; pure Benedictine observances, such as those of Monte Cassino and Vallombrosa; Cluniac adaptations in the houses of the congregation of Cava; and the Cal maldolese eremitic life.

During the thirteenth and fourteenth centuries, many houses of Benedictine monks had difficulty meeting the challenges of a changing society that was experiencing plague, warfare, and economic decline, and of a church that was weakened by internal schism and external controversy. At the same time, valiant efforts at reform were being made, and new forms of Benedictine monastic life were being created. The most strenuous attempts were those made by the papacy to revitalize monastic life. However, the decrees of the Fourth Lateran Council in 1215, which imposed triennial general chapters based on national or regional groupings, and the efforts of popes Honorius III (r. 1216-1227) and Gregory IX (r. 1227-1241) and a former Cistercian, Pope Benedict XII (1334-1342), were largely unsuccessful, since they came from outside rather than from within the houses of the order or from within the hearts of the monks.

During the later Middle Ages, the most successful attempts to revitalize monasticism took place in Italy, Sylvester Gozzolini (d. 1267) founded Monte Fano near Fabriano, from which the Sylvestrine Congregation grew. The hermit Peter Marrone (c. 1209 or 1215-1296, later Pope Celestine V) organized his disciples into the abbey of Monte Majella in central Italy, which grew into the Celestine order. A century later, Bernard Tolomei (d. 1348), after living in solitude near Siena, gave the Benedictine rule to his followers and founded the Olivetan branch

of the Benedictine order.

The fifteenth century saw many reform movements. Their prototype was the reform of Santa Giustina in Padua and of the subsequent congregation, undertaken by Ludovico Barbo (1382-1443). After restoring poverty, stability, and the common life to his own house, he extended his reform to several neighboring houses. His reform was shaped by a need, perceived in all monastic quarters, to combat the *commendam* system—the practice of granting monasteries to secular clerics or even to laymen to enjoy their revenues. To this end, Barbo suppressed the autonomy of the individual houses and radically altered the role of abbots in the monasteries. Monks now made their vows to the congregation, and authority rested in the general chapter, which appointed superiors and could move monks and abbots from one monastery to another at will.

Benedictine monasticism in medieval Italy was both creative and receptive, offering a life marked by rich and fruitful diversity. In the sixth century, Italy provided Christian Europe with a model of monasticism, the *Regula monachorum*, that would govern and influence monastic life for centuries to come. Italian monasticism was open to reform movements from the north, especially France, and itself offered the north reforms that would also bear fruit through the coming centuries.

Beneventan Chant

Beneventan chant was the music of the liturgy practiced in southern Italy before the adoption there of the standardized Gregorian chant of the Roman church. When the Lombards invaded from the north during the sixth century, they brought a wave of destruction and paganism but also planted on southern soil the seeds of a culture which was to endure for centuries and which developed its own characteristic Beneventan script and its own liturgy and music. The political capital of this area was the city of Benevento, and the liturgy and music developed there were in many respects independent of parallel developments in the Roman church. This rite spread throughout the south from Benevento and was practiced from the seventh century until its suppression in the course of the eleventh.

The southern Italian scribes who wrote this chant called it "Ambrosian"; and although Beneventan chant is not the same as the Ambrosian chant of Milan, there is enough kinship to suggest that the Lombards, northern and southern, once shared similar liturgies and music which then gradually grew apart, particularly after the fall of the Lombard kingdom of Pavia to Charlemagne in 774. Saint Ambrose is thus said to be the ancestor and protector of both rites.

The Beneventan liturgy was practiced at Benevento, Monte Cassino, Bari, and Salerno; in Dalmatia; and in other places almost as far north

as Rome. The surviving sources of Beneventan chant, numbering almost a hundred manuscripts and fragments, describe a geographical area in which the so-called Bene ventan script was practiced and which matches the range of the Lombards' domination in the south. The principal sources, from the Biblioteca Capitolare in Benevento (MSS 38 and 40), are Gregorian graduals that include Beneventan masses as appendixes to major feasts. Most other surviving sources are fragmentary or palimpsest, suggesting the deliberate suppression of the local chant during the eleventh century. Among the sources, the magnificent illustrated *Exultet* rolls of southern Italy should be mentioned; these were used in major monasteries and cathedrals for the blessing of the paschal candle on the vigil of Easter. Such rolls, when they contain the special Beneventan text of the *Exultet*, or the Beneventan melody which persisted long after most churches had converted to the imported Franco-Roman text, give further evidence of the extent and influence of the Beneventan ritual.

The shape and function of the Beneventan liturgy must remain to some extent uncertain, as there is no surviving sacramentary, missal, lectionary, or antiphoner. To judge from the surviving materials, the shape of the Beneventan calendar and the place of music in the mass and office were much like the practices of the Roman church.

Beneventan chants have a high proportion of nonbiblical texts and texts that rearrange biblical phrases and ideas. There is considerable flexibility in the assignment of liturgical items to specific feasts; it appears that the Beneventan liturgy never had the fixity which we associate with the Roman mass.

The old Beneventan chant has a uniform style. Although there are a few simple pieces, and a few melismas, the music generally proceeds at a regular, rather ornate pace, using mostly stepwise intervals. Scattered throughout are repetitions of melodic formulas, small invariable turns of phrase that are repeated far more often than their counterparts in other chant dialects.

In the Beneventan repertoire—unlike Gregorian chant—few stylistic distinctions can be made on the basis of liturgical function or modal category. There are no clear distinctions between music for the choir and music for the cantor. Even though the surviving repertoire is small, we have several pieces preserved in multiple sources, and in such cases

the sources agree, with only the smallest discrepancies.

The archaic features of Beneventan chant include a restricted tonal range. There is no evidence that Beneventan chant was ever subjected to the systematizing effects of the eight-mode system imposed on much other music. There is a remarkable economy of means in this music: the same few cadences and melodic formulas, a very limited range, and a tendency toward immediate repetition both at short range and for extended musical periods. These may be characteristics of music that has been transmitted orally for a long time.

Beneventan chant was written down substantially later than the Gregorian repertoire among the Franks; and it is certainly true that the other repertoires written rather late—the Old Roman and the Ambrosian—share a surface prolixity and some of the musical characteristics that are often called archaic but are perhaps simply typical of oral tradition.

Benevento

Benevento can be traced to an ancient Samnite city on the Calore River that was founded, according to legend, by Diomedes. Apparently, an early form of the name was Malventum (evil wind), and this was changed to Beneventum (good wind) by the Romans sometime after their victory over Pyrrhus in 275 B.C. During the third and second centuries B.C., because of its geographic location, Benevento was an important point in the development of the Appian Way, which eventually connected it to Brindisi. The city prospered throughout the Roman era, for both military and commercial reasons, and was a focus of recurrent patronage and development. Its importance as a Roman city is still attested to by numerous remains from the period, most notably the superbly preserved Arch of Trajan.

Benevento continued to be a major city in the Middle Ages. During the Gothic wars of the sixth century the Byzantine and Ostrogothic forces continually contended for it; in the course of these wars the city and its fortifications were razed by Totila. When the Lombards were overrunning northern and central Italy, a breakaway force under the leadership of Zotto seized Benevento in 571, rebuilt it, and made it the center of an independent principality or duchy. Under Zotto's successors Arichis I and Aio, the territories of the duchy were consolidated and the hereditary rights of its rulers were recognized. One of its most important rulers was Grimoald (r. 647-662), who was able to succeed to the Lombard crown itself in 662. He left his son Romoald to rule in Benevento, which was still recognized as a regime distinct from the Lombard realm of the north. In 663, shortly after this arrangement had been made, Emperor Constans II, seeking to reassert Byzantine authority in southern Italy, besieged Benevento; the attack was beaten off when Grimoald came to his son's relief. Under the successive dukes of this dynasty Benevento was caught in continually shifting relationships with and between the Roman papacy and the Lombard crown. During the time when the Franks absorbed the Lombard kingdom, Arichis II (r. 758-788), a son-in-law of the last king of the Lombards, Desiderius, succeeded in preserving the duchy of Benevento as an independent state; it would remain a major force in southern Italy under his descendants. Recurrently during the ninth and tenth centuries, Benevento was in conflict with neighboring powers and was involved in a rivalry with the restored Byzantine powers in

southern Italy. It was occupied twice by Byzantine forces (in 891 and 895) and was briefly annexed by the marquis of Spoleto, but it was fully reconstituted as a separate Lombard principality in 897. Under the Lombards' rule, Benevento flourished as a center of commercial and cultural activities, with extensive patronage of architecture and letters.

By the early eleventh century, a communal movement had developed in the city, and this movement flourished as threats by the Normans mounted. In 1051, the citizens of Benevento accepted the lordship of the Roman church; Pope Leo IX received confirmation of this acceptance from the German emperor Henry II, and it was on the basis of the Beneventans' recognition of papal overlordship that the reestablishment of princely rule was allowed in 1055. The arrangement was confirmed by Gregory VII in 1073, but four years later the death of the last Lombard prince brought the dynasty to an end. From then until 1815, Benevento was generally governed by papal deputies of one title or another—but with recurrent interruptions, as other rulers coveted it. It was occupied briefly by Frederick II (1241-1250) and then by Manfred (1258-1266), who was defeated and killed in Benevento on 26 February 1266 by Guelf supporters of Charles of Anjou. In the fifteenth and sixteenth centuries Benevento was briefly held by Angevin, Aragonese, and Hapsburg rulers. The Bourbons of Naples committed further depredations.

Benevento's Lombard era is commemorated by various remains, above all the church of Santa Sofia, consecrated in 760 and designed on Byzantine models. Its cloister, dating from the early twelfth century, has decoration that shows rich interactions of Muslim and local Christian styles. The cathedral, built in the early thirteenth century, was based on Apulian types and received subsequent decoration. Its bronze doors (also from the early thirteenth century), by an unknown master, are particularly impressive. The medieval castle, begun by the Lombards, received additions in later periods.

Benvenuto Da Imola

Benvenuto (late 1330s-1387 or 1388) was one of the most important commentators on Dante's *Divine Comedy* during the *Trecento*. He was born in Imola to a family of notaries and judges. In 1365, he represented Imola on an embassy to Pope Urban V in Avignon. From 1367 to 1376, Benvenuto taught grammar at Bologna, and in 1375 he gave public lectures on the *Divine Comedy*. From 1376, until his death he lived under the protection of the d'Este ruler in Ferrara, where he continued teaching and issuing publications on the *Comedy* and maintained a lively correspondence with Coluccio Salutati.

Even before Benvenuto began his teaching career at Bologna, he had written a treatment of Roman history, *Romuleon*, for Gomez Alborno, the nephew of Cardinal Alborno. In Ferrara, he would complete his survey of Roman history by writing *Liber Augustalis*, about the Roman emperors from Julius Caesar to Wenceslas. These historical efforts doubtless explain why Benzo d'Alessandria's *Chronicon* was mistakenly attributed to Benvenuto.

In both Bologna and Ferrara, Benvenuto contributed mightily to the recovery of humanistic learning in the Romagna region. Among his many commentaries are those devoted to Lucan's *Pharsalia*, Seneca's tragedies, Valerius Maximus, Virgil's *Bucolics* and *Georgics*, and

Petrarch's *Bucolicum Carmen*.

Benvenuto heard Boccaccio lecture on the *Divine Comedy* and supplied Salutati with copies of the works of Roman poets such as Propertius and Catullus. His most abiding contribution to learning is his massive commentary on the *Comedy*, in which he states his firm conviction that Dante was the greatest of all the world's poets.

Benzo D'Alessandria

Benzo (fl. 1311-1329) is remembered today as the author of the *Chronicon*. He was born in the Lombard city of Alessandria sometime in the latter thirteenth century and began his career as a notary. We have documents that demonstrate his presence in Milan as an imperial secretary in 1311 and in Como as an agent of its bishop in 1317. He then went into the service of Cangrande della Scala; we have two documents which he prepared for the rulers of Verona in 1329. That is the last we hear of him.

The *Chronicon*, mentioned by Guglielmo da Pastrengo and Galvano Flamma (or Fiamma), exists as Codex B 24 Inf. of the Biblioteca Ambrosiana in Milan. It is a volume of 285 parchment leaves in folio, written in a round Italian Gothic hand. From Benzo's own testimony in Book 14, we know that he composed some of it in Como during his seven years there in the bishop's service. From the same source, we learn that he also worked in the Capitular Library of Verona. The text was written by someone other than Benzo and passed through the hands of Azzo Visconti and the Dominican church of Sant' Eustorgio in Milan before coming to the Ambrosiana in the early seventeenth century. On the basis of Benzo's own comments and those of Guglielmo da Pastrengo, it appears likely that—as Remigio Sabbadini believed—the Ambrosiana codex does not contain the entirety of the *Chronicon*.

The *Chronicon*, as we possess it today, consists of twenty-four books that can be divided into sections. First, Books 1–10 comprise a treatment of sacred history from the creation to the capture of Jerusalem by Titus; the dominant influence on this section is Josephus's *Antiquities of the Jews* and *Judeo-Roman War*. Books 11–14 of the *Chronicon* form a geographical interlude; no author is as prominent here as Josephus is in the first section, but Isidore, Solinus, and Orosius are frequently cited. Books 15–19 deal with Macedonia, Alexander, and Alexander's successors in Macedonia, Egypt, and Syria. In Book 15, the

most significant authorities are Jerome, Justinus, and Solinus; the whole of Book 16 and large chunks of the next three books are derived from the *Speculum historiale* of the French Dominican Vincent of Beauvais. We can note here that the entire conception of the *Chronicon* and its elaboration reflect Vincent's influence. Books 20-24 deal with Greek history. Book 20 takes up the history of Argos and Athens through the Peloponnesian War; Justinus, Jerome, and Valerius Maximus are the principal sources. The next three books are essentially Benzo's rehandling of other works: Book 21 is a prose version of Statius's *Achilleid*; Book 22, on the Trojan War, relies primarily upon Dictys, with supplemental information from Dares and Servius; Book 23 is another prose version of a much longer poem by Statius, the *Thebaid*. Book 24 once again depends heavily on Vincent of Beauvais, especially in the chapters on the philosophers, e.g., Plato and Aristotle. This book as a whole is a presentation of the *facta et dicta* of the most famous Greek heroes, both mythological and historical; in its prologue, Benzo declares that the virtues and achievements of these pagans should inspire contemporary Christians to emulate them.

The most original section of the *Chronicon*, and the one which has attracted the most scholarly attention, is Book 25, on the cities of the world. Within the larger compass of this book, Benzo is at his most creative in his presentation of the cities of northern Italy, especially Milan. He demonstrates a familiarity with some quite obscure sources, such as Ausonius's *Ordo urbium nobilium*, which he discovered in the Capitular Library of Verona. Benzo is also at home with the medieval chroniclers, Arnulph and the two Landulphs.

The only chapter on an urban subject that rivals the one on Milan is Benzo's presentation of Rome, chapter 132. He begins by describing Rome as *provinciarum regina et urbium domina ac gentium princeps orbisque caput* ("queen of provinces, mistress of cities, and prime head of peoples and the world"). Just before the end of the chapter, he once again cites Ausonius: *prima inter urbes, deorum domus, aurea* ("first among cities, golden Rome of the gods"). He concludes with a medieval line: *Roma caput mundi tenet orbis frena rotundi* ("Rome, head of the world, holds the reins of the globe"). He draws the substance of the chapter from *Mirabilia*, *Graphia*, and Martinus Polonus. There are also references to Josephus, Livy, Virgil, Augustine, and Orosius. Benzo also

finds room for a prose rendering of some lines on Rome from Claudian.

Berengar I of Friuli

Berengar I (d. 924 or 928), marquis of the northeastern border march of Friuli, was a Carolingian on his mother's side. He was elected king of Italy in 888 following the overthrow of Charles the Fat, the last of the male line of Carolingians, in 887. Until 905, Berengar's position was challenged by a series of rival kings associated with Spoleto and Provence who usually had support from the French: Guy of Spoleto (889-894), Lambert (891-898), and Louis III of Provence (900-905). Berengar was also temporarily challenged by his own ally Arnulf of Carinthia (894-897), but Arnulf became ill and returned to Germany.

In addition to the numerous civil wars caused by these challengers, Berengar's reign was troubled by the first raids by Hungarians from the east and Arabs from the west. Although his rivals for the kingship had sought and obtained the imperial crown, Berengar himself did not achieve the title of emperor until 915. His reign was characterized by a marked decline in the authority of the central state, a decline hastened by Berengar's own numerous grants of land and legal rights from the royal fisc.

Berengar II

Berengar II (c. 900-966), marquess of Ivrea, had some claim to the

Italian throne through his mother, a daughter of Berengar I. Furthermore, his strong position in a border march in northwestern Italy threatened Emperor Hugh, Because Hugh evidently planned to have him eliminated, Berengar took refuge with the duke of Swabia in 941. But Hugh's position became increasingly insecure, and in 944-945 Berengar led a group of followers over the Brenner Pass into Italy, He gathered sufficient strength to force the abdication of Hugh in 947; Hugh died in 948.

The overthrow of Hugh left Hugh's young son, Lothar II, as king of Italy, and Berengar became the most influential of his counselors. The death of Lothar II in 950 gave Berengar himself an opportunity to be elected (with his son Adalbert) king of Italy.

Berengar II was never crowned emperor, and his reign was not a strong one. He was challenged in 951 by Otto I of Germany. Although Otto was generally successful, the situation in Italy at that time did not allow him to obtain the emperorship, and Berengar II continued to rule (in those parts of the Italian kingdom not held by Otto) until Otto returned at the pope's request in 961. Berengar II and his queen, Wilia, held out at the castle of Saint Leo in the Apennines until 963, when they were captured and sent to Germany, where Berengar died.

Bérengar Frédol

The canonist Bérengar Frédol (d. 1323) was born to a noble house in the

diocese of Maguelonne. He served Boniface VIII as a chaplain, and he was a compiler of *Liber sextus decretalium* (1298), Frédol became bishop of Béziers, and Pope Clement V made him a cardinal in 1305. Clement employed Frédol on diplomatic business, and Frédol took part in judicial inquiries concerning Boniface VIII and the Templars. He also tried, though in vain, to reconcile the Spiritual and Conventual Franciscans. Both Frédol and his nephew—who was also a cardinal and was named for his uncle—were candidates to succeed Clement. Several legal tracts written by Frédol survive.

Bergamo

Bergamo is the chief city in a province that runs a geographical gamut from the fertile plain of the Po Valley to foothills at the beginning of the Alps. The city is more or less at the center of the province in an east-west direction, and it is situated on the first slopes of the "pre-Alps," looking out over the plain of the southern part of the province, with the mountainous hinterland rising up behind it to the north. During the Middle Ages the boundaries of the province were the Adda River on the west, separating Bergamo from the area of Lombardy under Milanese control; the Oglio River, dividing Bergamo from Brescian territory to the east; a shifting line to the south separating Bergamo's territory from that controlled by Cremona; and the true Alps to the north. The area of the province—the medieval diocese and *comitatus*—comprises about 3,500 square kilometers.

The city of Bergamo lies at the mouth of two important alpine valleys: the Brembana and the Seriana. A third valley, the Cavallina,

opened into the Po plain a few kilometers east of the city. Val Cavallina provided a shortcut to Milan for those coming into Italy over the Brenner Pass. In order to guard these valleys and passes, the Romans took the site of an old Celtic city in 197 B.C. and established a fortified garrison on a hilltop just where the plain began to rise toward the mountains. This was a large camp, with about 2½ kilometers of walls. By 49 B.C. Bergamo was important enough to be designated a *civitas*. Later, during the medieval period, its Roman walls served as the foundations for a rebuilding of the civic fortifications, and they marked the urban boundaries until the Venetians enlarged the town with a new set of walls in the sixteenth century.

Political Situation in the Early Middle Ages

Because sources are lacking, it is difficult to learn a great deal about early medieval Bergamo. Bergamo became an episcopal city in the mid-fourth century. It was sacked twice in the fifth century: first in 408 by the Visigoths under Alaric, and again in 452 by Attila and the Huns. Soon after the death of Theodoric, the city was described as well defended, and one can assume that it still possessed its Roman walls and fortified gates. According to local legends, when the city came under Byzantine control in 556 its fortifications were repaired by the new rulers; but there is no physical evidence and no evidence in the surviving sources that these legends are true.

Little is known of politics in Bergamo during Langobard times. From 575 on, Bergamo was an important duchy, extending as far as the eastern shore of Lake Como, and it had close ties with the Isola Comacina. Its territory also grew in other directions. When Cremona was destroyed in 603, its lands were split between Bergamo and Brescia. The Langobards used the city's location to full defensive advantage in their battles against the Franks, but Langobard Bergamo disappeared in 774 after Charlemagne took Pavia and destroyed the Italian kingdom. The Langobard rulers of Bergamo were replaced by Frankish counts in 774 or 775, and the mountainous territories of the *comitatus* were given to two of the most important Frankish monasteries: Saint Martin of Tours and Saint Denis, near Paris. By the time of Charles the Bald

(823-877), the politics of Bergamo, such as they were, were completely imperial.

In the later ninth century and the tenth century, Bergamo remained an important center for the Italian kings, though it was never a docile subject. In 904, King Berengar I conceded the rights of fortification of the city to its bishop Adalbert and its leading citizens (*concives*), making the bishop the de facto military lord of the city. Berengar seems to have made this concession from a position of weakness. The Hungarians' invasion of 902 had wrecked the city's walls and gates, and the king was in no position to rebuild its fortifications. Whatever the precise circumstances may have been, this is one of the earliest known instances when a northern Italian city gained control of these rights. It also marks the beginning of the ascendancy of episcopal power in the town and the eclipse of the secular power of the counts, which had been so important during the Carolingian era. That this was the intention of the bishops is proved by a pair of documentary forgeries. One, dated 968, purporting to be from Otto II, gave the bishop control over all lands up to three miles (about 5 kilometers) from the city. A second, dated 1041 and supposedly signed by Henry III, gave the bishop control over the whole *comitatus*.

The later tenth century in Bergamo was a period of growing sympathy toward the imperial powers, and the Ottonian emperors were directly involved in episcopal elections in the city from the 970s into the early eleventh century. The most notable of the eleventh-century bishops, Arnolfo, who was elected in 1077, was firmly on the imperial side. By the end of the eleventh century, the secular counts too, weakened as they were, had been tied to the empire for many years. In 1092, Bergamo did enter briefly into an anti-imperial league with Milan, Cremona, Lodi, and Piacenza, but it remained something of an outsider and was significantly less developed, economically and socially, than the other members of the league.

What is most important at this period of Bergamo's history is not so much the external sympathies of the ruling classes as the internal manifestations of significant power. The church, and particularly monastic bodies, owned a great deal of valuable land in the *comitatus*. It has been estimated that religious foundations—episcopal and monastic—owned about one-third of all the improved land (that is, land

with buildings on it) in the province. By the end of the eleventh century the bishop was popularly viewed as the real lord of the *comitatus*. This was particularly true among the many people (called *semiliberi*) who accepted ecclesiastical control but were not economically dependent on the church. The close relationship between the borders of the diocese and the early medieval *comitatus* and the similarity of both to the borders of the old Roman *civitas* are strong evidence that there was an essential continuity of administrative structure throughout the early medieval period, whether the actual ruler was a Langobard king, a Carolingian count, or an imperial bishop. Nevertheless, the first clear separation since antiquity of the city from its surrounding *contado* (countryside) occurred under episcopal rule. Beginning with Adalbert's rebuilding of the city walls and gates in the early tenth century, the city of Bergamo came to be seen as more and more distinctly separated, both socially and juridically, from its rural hinterlands.

The ecclesiastical history of Bergamo is interesting but convoluted. External control was a continuous part of the religious presence in the surrounding *contado*. The Frankish monastic influence in the *contado* was replaced by that of several Cluniac houses established in the late eleventh century. In the city, under episcopal control, things were not so simple.

By the late eighth century there were already four important basilicas in Bergamo: the cathedral of Sant' Alessandro (Saint Alexander), located outside the walls to the west of the city; and the churches of San Pietro, Santa Maria, and San Vincenzo. San Vincenzo had been built near the center of the walled city by the Langobard kings as the Arian cathedral, and its construction marked the beginning of double cathedrals in Bergamo. When Charlemagne took the city in 774, he venerated its most important relic, the body of Saint Alexander, and granted donations to the saint's church. The Carolingians' veneration of the saint lasted through ninth century. When Charles the Fat visited the city in 883, he also took time to visit Alexander's relics. At least since the middle of the tenth century there had been a hostel for pilgrims at the cathedral of Sant' Alessandro. From 879 on, a weekly market, under the control of the bishop, was held near the church, outside the walls of the city. But in 908 the bishop transferred the rights for this market to the canons of San Vincenzo. This concession is

further evidence that ecclesiastical power was moving within the walls of Bergamo. About 90 percent of the Bergamasque clergy lived inside the city, and from at least 897 on, the urban cathedral of San Vincenzo was referred to as a *domus*, a term signifying its primacy over the other churches, particularly Sant' Alessandro. Beginning in the eleventh century, squabbles between the bishop and the canons of San Vincenzo over control of the market became more frequent, despite a tradition, by then firmly established, that the canons of San Vincenzo alone, without any voice from the canons of Sant' Alessandro, elected the bishop.

The twelfth century saw the culmination of the struggle for primacy between the chapters of the two cathedrals. This conflict began in the early 1130s and came to a head in 1146, when the bishop was murdered. The eventual results were a lawsuit, which was won by the canons of San Vincenzo, and a decline in the importance of the cathedral of Sant' Alessandro—which ultimately disappeared altogether.

This sordid ecclesiastical history can in many ways be seen as paralleling the political situation in Bergamo at the beginning of the communal period. Storti Storchi (1984) interprets the two cathedrals as representing the pro- and anti-imperial factions in Bergamo. Sant' Alessandro, the church outside the city walls, was the center of anticommunal and pro-imperial sentiment, and it was the church of the local counts and representatives of rural power. San Vincenzo, on the other hand, was staunchly episcopal; this meant that it was the cathedral of the commune, since there were few apparent problems between the bishops and the citizens of Bergamo in the twelfth century.

The disappearance of the church of Sant' Alessandro as a center of power did not, however, mean that the long-entrenched imperial sympathies of Bergamo vanished. The province and the city remained supporters of the emperor and his policies until after the mid-thirteenth century and the collapse of the Hohenstaufen designs on the peninsula. In 1235, following a war with Milan, the Bergamasque church was placed under a papal interdict that would last more than twenty years. In 1236, the commune responded to this exercise of Roman authority by renewing its allegiance to Frederick II. In the 1240s, Bergamo supported Frederick's son Enzo in his war against Brescia; and that decade also saw the revival of imperial *podestà* in the city.

The persecution of heretics in the Bergamasque *contado* in the later thirteenth century and the early fourteenth can be seen at least partly as a result of these lingering sympathies toward imperial power. In the 1260s, the bishop, Erbaro, began to have difficulties with the commune because he felt that the civic statutes impeded his attempts to eradicate heresy. The subsequent additions to the statutes made in 1267 included antiheretical laws drawn from imperial as well as papal sources. But the intensity of the persecution in this region was not simply a result of paranoia among the orthodox. The mountainous alpine hinterland was a popular place for outlaws of all sorts. In the early fourteenth century the infamous Fra Dolcino hid out in the upper reaches of the Bergamasque valleys, and many of his supporters were from the region.

Communal Period

The relations between church and commune in medieval Bergamo involved the city's two most important and powerful organizations. Like many other Lombard cities, Bergamo developed a communal organization early in the twelfth century. The establishment of the commune is usually dated from 1117, but careful readings of the documents have established that consuls are first mentioned in the city in 1108; thus it can be assumed that a consular form of civic government dates from the very early years of the twelfth century. Structurally, the earliest civic government at Bergamo has been characterized as an "aristocratic commune." Jarnut (1980) discovered that before 1100 the city had almost no merchant class of *negotiatores*; this finding corroborates his observation that in the early medieval period the city's social structure reflected a firm concentration of power in an aristocratic urban elite. Although Bergamo had many of the prerequisites for a prosperous mercantile economy in the tenth and eleventh century—its own fair, a weekly market, and good roads to other important economic centers and ports—it did not become one of the economically important cities of Lombardy.

One of the most fascinating sources concerning life in Bergamo during the early communal period also supports the idea that the commune was an aristocratic establishment. Mosè del Brolo's civic

encomium *Liber Pergaminus*, written about 1120, contrasts the *dives* and the *pauper* (the rich and the poor) as two different types of citizens, bound together in a pact of peace.

The imperial leanings of Bergamo lasted well into the twelfth century. In 1158, Bergamo, along with other traditional enemies of Milan, supported Barbarossa's siege of that city; in 1162 Bergamasque troops helped in the partial destruction of Milan. But only a few years later, in 1165, the political situation had changed so dramatically that Bergamo joined with Verona and Padua in an anti-imperial organization, the Veronensis Societas. In April 1167, Bergamo was one of the founding members of the Lombard League, which was established at the monastery at Pontida, in Bergamasque territory. Bergamo then helped with the rebuilding of the walls and gates of Milan, a project which began only three weeks after the foundation of the Lombard League. Another indication of Bergamo's political about-face also came soon after the meeting at Pontida: Bergamo's bishop, Gerard, whose sympathies were staunchly imperial, was deposed by the papal legate, with the support of the citizens. The new bishop, Guala, who was consecrated in 1168, was thoroughly anti-imperial in his outlook and actions. One imperial legacy that was not tossed out, however, was the office of *podestà*, which had first been introduced at Bergamo in 1163 as an imperial administrative post. During the late twelfth century and the early thirteenth the commune alternated between consular rule and rule by *podestà*.

After the peace of Constance, concluded between the cities of the Lombard League and Barbarossa in 1183, Bergamo continued to develop along lines that can be considered largely normal for Lombard communes in the late twelfth century. Consuls of justice (*consules iustitiae*) are first noted in documents in 1186. There is a mention of a *liber statutorum* (book of statutes) in 1198. A communal palace was erected in the center of the city; this palace is first noted in the documents in 1198, but in all probability it was already built in 1195. These are the most obvious innovations in the communal structure after the defeat of the emperor, and all of them had to do with an attempt to establish the rule of law—the chief characteristic of the communal period after the peace of Constance.

The consuls were the most typical feature of the early communal

period in Bergamo. The establishment of the commune in 1108 is identified by the first appearance of consuls in the documents, and the consular council was the chief instrument of government until the imperially appointed *podestà* appeared in the 1160s.

There seem to have been three separate consular assemblies in the early commune. (1) The largest was the *arengo*, a popular assembly of all citizens. It did not meet regularly, and its chief purpose was to approve or disapprove (by acclamation) business brought before it by the smaller councils. (2) Next in size was the general council, the main deliberative body of the commune. This was still a large group: though its membership fluctuated noticeably, it generally consisted of several hundred leading citizens who were representatives of the various sections of the city, the *vicinie*. Storti Storchi (1984) points out that in the Middle Ages Bergamo had an extremely well-developed vicinal organization. The number of *vicinie* varied, but there were generally about twenty throughout the twelfth and thirteenth centuries. Storti Storchi claims that the communal organization of the early twelfth century was mainly a centralized imitation of these more localized administrations. (3) The smallest but most important council was the *consiglio di credenza*, which met regularly and frequently and served as the executive arm of the communal government. It controlled the activities of all the other social organizations in the city.

One of the most substantive changes in communal organization that resulted from the peace of Constance was a transfer of judicial authority from the bishops to the communes themselves. These communal councils, as the only legitimate expression of power and deliberation in the communes, retained exclusive control over, and exercise of, the law and punishment. This fact explains the appearance of the judicial consuls in 1186, and the increasing preoccupation with legal matters and procedures in communal life during the late twelfth century and the thirteenth century.

Since the law was the fulcrum of the new communal life, a crucial requirement was that laws had to be created and preserved in a form which made them accessible, at least in theory, to all citizens. This form was the book of civic statutes, the *liber statutorum*. In Bergamo, such statutes are mentioned from 1198 on, and it is reasonable to assume that they existed in some form before then. Mosè del Brolo, in his *Liber*

Pergaminus, speaks of twelve citizen magistrates whose job was "to examine the holy laws night and day" (*sanctas leges scrutantes nocte dieque*).

The oldest surviving communal statute book, called the *statutum vetus* (old statute), dates from 1248 but includes statutes from earlier in the thirteenth century and survivals from before 1200. Earlier statutes from a private civic organization, the Società del Popolo, were incorporated into the communal statutes in 1230. There are also some surviving fragments of statutes, dated 1237. Additions were made to the statutes in 1253, and in 1267 a completely new redaction was made that included both imperial and papal proscriptions against heresy. In the fourteenth century the statutes were revised continually, beginning in 1307. Surviving compilations date from 1331, 1333, 1353, 1374, 1391, and finally 1422.

The statute book was kept in the communal palace, where it was to be available to any citizen who wanted to consult it. There was also another public book, called *Bos*, that was kept with the statutes. This second book contained all the bans, public edicts, and proclamations of the commune, as well as the fines established for misdemeanors. It thus served as a sort of running set of minutes of communal deliberations.

The communal palace—now called the Palazzo della Ragione—was a new addition to the civic fabric in Bergamo after the peace of Constance. The commune obtained property in the center of the city (by purchase and, apparently, by the exercise of eminent domain) in order to construct a palace that would suitably house the two most characteristic public communal activities: consular gatherings and judicial proceedings. The palace faced south toward the church of Santa Maria Maggiore and, as was to be typical for such communal structures in Lombardy, was very large but architecturally straightforward. It was rectangular and consisted of a large single *salone* over an arcaded ground floor. The ground floor is now open on three sides, allowing passage beneath the palace from one piazza to another, but it was originally open on only two sides—the south and the west. The Palazzo della Ragione is the first building in the city that shows any awareness of the developing Gothic style of northern Europe. Its Gothic quality is hesitant but is most clearly noticeable in the pointed arches of the arcade, and the adoption of the new architectural style for what was

fundamentally a new kind of building seems to have been a conscious choice.

Although the commune is the classic—and most important—example of the tendency of northern Italian city dwellers of the later Middle Ages to organize themselves into associations, it was by no means the only form of association existing in the city. In the late twelfth century, popular new religious societies were already being formed; chief among these was the Humiliati, which first appeared in Bergamo in 1171. A general characteristic of the communal period was the formation of secular or quasi-religious societies that were essentially civic in nature. According to Belotti (1959), there was a rudimentary popular Società delle Armi as early as 1179; it was reorganized in 1206 and again c. 1230. Storti Storchi is not so definite about the beginnings of the Società delle Armi, dating it only from sometime before 1226. It is certain, however, that the statutes of this organization were incorporated into the communal statutes in 1230. Some surviving additions made to the statutes in 1257 mention *societates*, and on the basis of these Storti Storchi argues for the existence of other popular societies during the first half of the thirteenth century. A Societatis Sanctae Mariae Majoris was in existence before 1289, and there was also a Societatis Sanctae Salvatoris in the late thirteenth century.

By the early fourteenth century, public life begins to take on a certain hysterical tone, which is reflected in the formation of still more popular societies. In 1307, a Società delle Armi del Popolo was established with a membership of 500, soon increased to 800. Storti Storchi holds that this society was established "as an extreme act of faithfulness towards the institutional forms of the commune." A new society founded in 1316, again reflecting the ideals of the commune, was the Societas Iustitiae Populi Pergami. As the institutions of the communal period collapsed and were replaced by early tyrannies, these civic societies assumed more overtly religious forms. In 1326, a new organization appeared, the Societatis Manus Christi et Populi, which was not as large as the earlier societies but nevertheless had 400 or more members.

These societies should not be seen simply as expressions of individual or corporate piety or civic-mindedness. They were important attempts by the citizens of Bergamo to prevent the city's aristocracy from twisting communal structures to serve its own purposes. The

aristocratic families—the most important were the Suardi, Colleoni, Rivola, and Bonghi—were held in check to a certain extent by the commune. However, these families were restrained mostly because power was so evenly balanced among them: no single family could exert control over the city for any length of time without suffering a counterattack from the others.

Most of the civil discord from the late twelfth century until well into the fourteenth was a result of, or was at least exacerbated by, the attempts of these aristocratic families to dominate the city. There are reports of civic disruptions as early as 1179, though little is known of the exact circumstances or the protagonists. In 1206, a serious intramural war occurred, with the Suardi fighting the Rivola. This was also a war of the urban nobility against the commune, embodied by the *podestà*. The second half of the 1220s was a period of more or less continual civil war, with the Colleoni and the Suardi pitted against the Rivola, and all the noble families fighting the Società del Popolo.

Despite these internal conflicts, most of the wars Bergamo was involved in from 1230 until the end of the thirteenth century were external. The city consistently took the imperial side. In 1296, though, the most serious intramural conflict of the communal period occurred, initiating a period of civic instability that lasted until 1307. What began as a battle between supporters of the Suardi and those of the Colleoni escalated into an all-out civil war. The Suardi were driven out of the city, only to return immediately with support from the Milanese; the Suardi in turn exiled the Colleoni and their allies.

The Suardi were able to maintain control of Bergamo only with continuous assistance from outside. In 1301, they had to ask Matteo Visconti for help. In 1310, the Holy Roman emperor Henry VII declared the Suardi the hereditary lords of the city, but he neglected to support them beyond this, and two years later they were driven out of Bergamo by the Colleoni. In 1328, the Suardi again gained control of the city, again with the help of the Visconti; from then until the early fifteenth century, except for brief periods, the Suardi maintained nominal control, though essentially acting as creatures of the Visconti.

The end of the commune in Bergamo marks the end of its medieval history. The decline of communal institutions is a sad story, though not unusual in early fourteenth-century Lombardy. Beginning with the civil

war of 1296, urban stability became the exception, not the rule. The revisions of the statutes in 1307 and the formation of new citizens' societies were symptoms of the distressed condition of civic institutions. By the early fourteenth century the bureaucratic structures of the commune had become so complicated and rigid that they no longer functioned effectively, and the commune could no longer fend off attempts by the urban aristocracy to gain control of the city.

Henry VII's entry into Italy in 1310 provided an impetus for the Ghibelline Suardi to set themselves up as the first hereditary lords of the city. This lordship did not survive the reaction of the other powerful families in Bergamo, but it foreshadowed things to come.

In 1315, Matteo Visconti became *signore* of Bergamo, and two years later the city was officially made a subject of Milan. This subjection was short-lived; by the end of 1317 the Visconti's authority in the city had ended, at least temporarily. Over the next few years, it becomes difficult to be precise about events in Bergamo.

Local control apparently did not prove up to the task of governing the city after domination by Milan was rejected. In the early 1320s, Federico della Scala was effectively in control of Bergamo, maintaining what was essentially an unofficial *signoria* which lasted until 1324. At this time the people of Bergamo attempted once again to govern themselves, but without notable success; and in 1327 Louis the Bavarian, who had recently crossed the Alps, was proclaimed *signore*. This new *signoria* was pro forma rather than indicative of any real political change, and in 1328, the Suardi—the most pro-imperial of Bergamo's families—were able to reestablish control of Bergamo. The Suardi may have been able to dominate the other aristocratic families of the city, and the tattered remnants of the Popolo, but they were ineffective against external threats, and in 1329 the Visconti again took power in Bergamo, though this time with a Suardi as putative "protector."

The double burden of control by the Suardi and the Visconti was too much for the citizens of the city, and in early 1331, Bergamo, along with many other Lombard cities, enthusiastically placed itself under the protection of the northern emperor John of Bohemia. Though destined to last no more than a few months, John's reign in Bergamo was a watershed in the city's institutional history. This was the first true

signoria, legally speaking. It is ironic that what had been intended by the city as a last desperate attempt to revive the old communal forms ended with the legalizing of disdain for the law on the part of those in authority. When Azzone Visconti became *signore* in Bergamo in 1332, he was legally exempted from obedience to the laws of the city. In this form, domination by the Visconti continued through the rest of the fourteenth century and into the fifteenth, until the Milanese were replaced by the Venetians as lords of the city in 1428.

Art and Architecture

Physically, Bergamo remains, as the guidebooks say, *molto suggestiva*—very evocative. The upper city especially gives a good idea of what a Lombard mountain town was like at the end of the Middle Ages. The present walls and gates are Venetian constructions of the sixteenth century, and there is much in the city that is Renaissance or pseudo-Renaissance; but if one looks past the Palladian windows, evidence of the fourteenth, the thirteenth, and even the twelfth century begins to appear.

The most famous medieval building in Bergamo is the Romanesque church of Santa Maria Maggiore, whose towers and cupola crown the upper city. It was begun in 1137, and according to an old tradition it was built as an ex-voto for the deliverance of the city from drought and famine in 1135. Equally correctly, however, Santa Maria Maggiore can be seen as a sort of informal communal cathedral, built to serve civic as well as religious functions. This new church was built at exactly the time when the two official cathedrals—Sant' Alessandro and San Vincenzo—were embroiled in a dispute over ecclesiastical primacy in the city. Neither of the two older buildings was really satisfactory as the chief church of a city as important city as Bergamo: Sant' Alessandro was outside the walls and was dominated by the conservative rural nobility of the *contado*; San Vincenzo was too small and too plain to reflect the dignity of communal Bergamo. Once Santa Maria Maggiore was completed, it was made officially a part of San Vincenzo and hence a "cathedral" of the city.

Santa Maria Maggiore is the largest church in the city. It is near the

center of town, just a few feet away from the cathedral of San Vincenzo, and it looks out over the modern lower city and the Po plain stretching off to the south. It has a curious shape for a Romanesque church, with a truncated nave of only two bays. The reason for this abrupt termination is that the bishop's palace stands just to the west of the church and could not be encroached on. This also explains why the church has no western entrance; instead, its entrances are in the south and north transept facades.

The exterior of the church is largely unchanged from its twelfth-century form. There is a fine series of carved capitals spread around the east end of the basilica. The most noticeable additions to the outside of the church are three fourteenth-century Gothic portals, the work of Giovanni da Campione. The most magnificent of the three faces a small square to the north of the church and is dated 1350-1353. The second, a minor portal which opened into the old sacristy (1364-1367), faces the southwest corner of San Vincenzo. The third is a porch, dated 1360, added to the south transept doorway. Above it is a tabernacle by the German artist Hans von Fernach, which was added in 1401-1403.

The twelfth century is also represented in Bergamo by a few towers, the last survivors of forty or so that have been located in the city. Mosè del Brolo had described Bergamo as a city with not many towers (and thus an internally peaceful city, since house-towers were symbols of the powerful families). If there were forty towers in Bergamo, however, its twelfth-century skyline must have been spiky indeed. One of the surviving towers, at the northwest corner of the Piazza Vecchia, came to be used as the communal tower and is still used as a public clock tower; it was a house-tower of the Suardi until it was taken over by the commune in the late twelfth century. Another tower is the Torre Gombito, on Via Gombito, just down the hill to the east of the Piazza Vecchia. The Torre Gombito gives a very good idea of what these towers originally looked like, since, unlike the communal tower, it has been modified scarcely at all.

After the church of Santa Maria Maggiore, the most important twelfth-century structure in the city is the communal palace, the Palazzo della Ragione, just north of Santa Maria Maggiore and facing that church across the present-day Piazza del Duomo (in the communal period the Platea Parva Sancti Vincentii). The palazzo was built c. 1195

and is the oldest substantially intact communal palace in Lombardy. Its northern ground-floor arcade, which allows one to pass underneath the palace from the Piazza del Duomo to the Piazza Vecchia, is a result of a building program during the mid-fourteenth century. That program also produced the present Piazza Vecchia, and a reorientation of the communal palace away from the ecclesiastical Piazza del Duomo toward the secular Platea Nova (now the Piazza Vecchia). The reorientation involved constructing a new stairway at the northeast corner of the palace and a new ceremonial facade on the north face. It is often said that the Palazzo della Ragione was completely rebuilt in the mid-sixteenth century, following a fire in 1513, but this is not true; the form and most of the details of the palace are clearly medieval. The most obvious Renaissance additions are the two windows on the south side and the vaults under the ground-floor portico.

Little else survives from the thirteenth century in Bergamo. An extensive set of frescoes, usually dated to the end of that century, was uncovered in 1937 in the hall connecting Santa Maria Maggiore to the bishop's palace. The frescoes depict the Annunciation, the Last Supper, and an extended cycle of episodes in the Apocalypse. Their style can most kindly be characterized as "provincial," but they are nonetheless interesting because they are so complete.

At the eastern edge of the hill on which the *città alta* (upper city) is built, just inside the Venetian Porta Sant' Agostino but outside the medieval walls of the city, is the former church of Sant' Agostino. The convent was founded in 1290, and the church was consecrated in 1347. Although some rebuilding was done in the fifteenth century, the church, particularly its facade, is a good example of late thirteenth-century Lombard monastic architecture. There are close connections between the traceried windows of the facade and the windows of the north side of the communal palace, which were rebuilt when the Piazza Vecchia was constructed in the first half of the fourteenth century.

The Piazza Vecchia itself, the traditional heart of the upper city, is an important remnant of medieval Bergamo. Though its paving is modern and the handsome fountain in its center is from the eighteenth century, the square as a whole is a fine example of late medieval urban design. It was one of the first purely secular piazzas in northern Italy, focused not on a church but on the Palazzo della Ragione, at the southern edge. It is

ironic that this piazza was created with the communal palace as a backdrop just at the time when the commune was collapsing.

The western side of the Piazza del Duomo, south of the communal palace, is now closed by a gem of fourteenth-century Bergamasque architecture: the baptistery. This was the first of the works done in the city by Giovanni da Campione, and when it was built in 1340 it was located inside the church of Santa Maria Maggiore. By the mid-fourteenth century any distinction that had ever existed between the cathedral of San Vincenzo and the basilica of Santa Maria Maggiore had become blurred, and for all intents and purposes the two churches acted as a double cathedral—San Vincenzo as the summer cathedral and Santa Maria Maggiore as the winter church. Nevertheless, it is extremely rare to find a completely separate baptismal structure built inside an already existing church. The statues of the Virtues, at the angles of the upper part of the exterior, are among the best examples of fourteenth-century sculpture in the city.

The finest medieval tomb sculpture surviving in Bergamo is on the sepulchre of Cardinal Guglielmo Longhi, who died in Avignon in 1319. The tomb, by Ugo da Campione, was originally in the Franciscan church; in the nineteenth century, when San Francesco was destroyed, the tomb was brought to Santa Maria Maggiore, where it now stands in the southern aisle.

Santa Maria Maggiore also contains fragments of two large fourteenth-century frescoes on the end walls of the transepts: in the north transept are a Last Supper and various miscellaneous scenes; in the south transept is a very large Tree of Life, painted in 1347.

The dominant secular aspect of life in the later Middle Ages is represented in Bergamo by two fortresses: the Rocca at the eastern end of the city and the Cittadella toward the west. The Rocca, built on the eastern height (on the remains, some believe, of the *capitolium* of the old Roman camp), was begun by John of Luxemburg in 1331, during his short-lived domination of the city, and was later extended by the Visconti. It served a military purpose until the nineteenth century, when it was used by the Austrians. The very large Cittadella, at the western end of the upper city, was originally the *hospitium magnum* of the Firma Fides, but it was taken over and fortified by Bernabo Visconti beginning in 1355. It too remained in use for military or quasi-military

purposes until the mid-nineteenth century. Restorations carried out in the 1950s have brought back some of the medieval characteristics of the fortress, especially the long portico on the north side of the square.

But it is a mistake to look for medieval Bergamo primarily in a few isolated buildings, fragmentary frescoes, or tombs. The whole upper city remains, to a remarkable extent, medieval in flavor. The layout of the town, and especially its pattern of streets and squares, has not changed noticeably since the end of the Middle Ages, and there are many stretches where one may encounter the twelfth century as easily as the twenty-first.

Bernard of Clairvaux, Saint

Saint Bernard of Clairvaux (Bernard de Fontaines, 1090-1153) was born into a noble family near Dijon in Burgundy. As a young man, he was attracted by the devotion and austerity of the nascent Cistercian order, and in 1112 he entered the recently founded abbey of Cîteaux. Three years later, at the request of Abbot Stephen Harding, he founded his own abbey at Clairvaux. Bernard's extraordinary energy and eloquence soon propelled him to the forefront of ecclesiastical and political activity in twelfth-century Europe. While never less than conscientious in the administration of his abbey, he traveled widely to preach, often to huge crowds, and to advise his fellow Cistercians; he was a valued counselor to several princes and eventually to a pope, Eugenius III, who had been his disciple at Clairvaux; and he was involved in all the major institutional and theological controversies of the time, notably the election of the schismatic "pope" Anacletus in 1130 and the debate surrounding the radical ideas of Peter Abelard in the 1140s. Bernard's output of writing was also prodigious: it included many volumes of sermons (including a famous set of eighty-six on the *Song of Songs*), moral and theological treatises, devotional works, a biography of the Irish Cistercian Saint Malachy, essays on monastic discipline, a manual of advice for Pope Eugenius (*De consideratione*), a rule for the order of Knights Templar, and hundreds of letters. Bernard was canonized in 1174.

Bernard's influence in Italy was considerable. The Cistercian Order arrived in Liguria in 1120, and its ideals—and Bernard's reputation—spread widely in Italian culture through the numerous Cistercian abbeys founded subsequently and through Bernard's own travels in northern Italy in the 1130s. Apart from the widespread dissemination of his own works and of iconography portraying him, there are many references to his writings in the enormously popular *Meditazioni della vita di Cristo*, a *volgarizzamento* (vernacular translation) of *Meditationes vitae Christi* (c. 1256-1263) attributed to Giovanni de' Cauli; also, Dante famously chose Bernard as sponsor of the final vision of Beatrice, Mary, and the godhead in the closing cantos of *Paradiso*. Bernard also had an immense influence, either directly or through intermediaries such as Joachim of Fiore, on the Spiritual Franciscans, especially because of his advocacy of personal and ecclesiastical poverty: Ubertino da Casale in particular drew significantly on

Bernard's works.

Bernardo Da Pavia

Bernardo (d. 1213) was provost of Pavia when he compiled his *Breviarium extravagantium* (c. 1190), an early collection of papal

decretals ordered in books and titles, like Justinian's *Corpus juris civilis*. Bernardo's collection also included, alongside letters of popes such as Alexander III, patristic texts omitted from Gratian's *Decretum*. Later collections of decretals would follow its division into five books, treating judges, procedure, the clergy, marriage, and punishments. By the time his collection was published, Bernardo, a pupil of Giovanni da Faenza, had taught canon law at Bologna for more than a decade. Bernardo served as bishop of Faenza from 1191 to 1198. In that period he composed *Summa decretalium*, an exposition of canon law following the order of his collection. Bernardo was transferred to the see of Pavia, where he remained until his death. While at Pavia, he composed his *Casus decretalium*, summaries of individual canons.

Bernart De Ventadorn

Historically, very little is known of the Provençal poet Bernart de Ventadorn (Bernard de Ventadour, died c. 1195), but he was long considered the most distinguished of the troubadours and is still so regarded by many critics. Since no document mentions him, he must

have been of humble origins. Very likely, as an Old Occitan *vida*, or biography, of the thirteenth century suggests, he was born in the Correze in the castle of the viscount of Ventadorn, Eble II (1106-1147), who was himself a troubadour. Bernart must have stayed at the court of Raimon V of Toulouse (1148-1194), whom he mentions in several poems. According to the *vida*, Bernart—like Bertran de Born—died in the Cistercian abbey of Notre-Dame de Dalon in Perigord. Bernart's literary production seems to fall into the period 1140-1170. The *vida* romanticizes his life to a great degree, reporting, for instance, that Bernart fell in love with the viscountess of Venta dorn, had to leave the castle, and fled to a woman who is described as a duchess of Normandy—actually Alieanor (Eleanor) of Aquitaine, who soon afterward married Henry II of England.

Bernart composed at least forty-one poems, eighteen of which are preserved with the melody; all but two belong to a genre called *canso* that exclusively celebrates the traditional topoi of courtly love: descriptions of spring, the emotional state of a lover meeting the beloved, condemnation of slanderers and the jealous, and so on. He composed according to the strictest rules of the *trobar leu*, in which clarity and simplicity of expression are combined with great sincerity, and he believed that authentic love inspires equally authentic poetry. For him, love and poetic inspiration are united.

Bernart's poems were extremely popular in Italy: they are found nearly complete in the *chansonniers* composed there. The famous verses *Can vei la lauzeta mover/de joi sas alas contra•l rai/que s'oblid' es laissa chazer/per la doussor c'al cor li vai* ("When I see the lark move its wings with joy toward the sun's rays until, forgetting itself, it lets itself fall for the sweetness that goes to its heart") reappear in Dante's *Divina Commedia* (*Paradiso*, 20:73-75): *Quale allodetta che 'n aere si spazia/Prima cantando, e poi tace contenta/De l'ultima dolcezza che la sazia* ("As the lark that soars in the sky, at first in song and then silent, content with the last sweet note that satisfies it").

Bernhard

Bernhard (Bernard, c. 797—817 or 818) was nominally uie king of Italy from 812 or 813 to 817. He was the son of Pepin, who in 781 had been named king of Italy by his father, Charlemagne. This kingship was of a subordinate nature; real authority was in the hands of the Frankish ruler (Roman emperor after 800).

When in 817 Louis the Pious (Bernard's uncle, and successor to Charlemagne) provided for a division of territory among his own sons, Italy was included in the realm of the eldest son, Lothair. What significance this actually had for Bernhard's position was not made clear, but Bernhard and his advisers rebelled against Louis. Their rebellion was put down, and the leaders were taken to Francia. Bernhard was blinded, as a punishment, and died. Louis the Pious later did penance for this act.

Bertran De Born

The troubadour Bertran de Born (c. 1140-before 1215) belonged to a seignorial family whose domains formed the border between Limousin and Périgord; he inherited the castle of Hautefort in northern Perigord. He was a vassal of the dukes of Aquitaine (i.e., of the Plantagenets), and his possessions were adjacent to those of the king of France—an unfavorable position, because his lands were continually devastated by one lord or another. This situation explains Bertran's involvement in contemporary politics and military adventures. He sided first with young Henry, oldest son of Henry II of England, against young Henry's brother Richard, who was favored by their father. An Old Occitan *vida* (biography) reports that Bertran "constantly wanted the father, the son, and the brother to go to war against each other." Young Henry, who was a close friend, inspired Bertran's most famous *sirventes*, or poem of blame, as well as his masterwork, a *planh* (lament) on Henry's death in 1183. The successor to the "young king" (as young Henry was called; he had been crowned while his father was still living, to ensure the succession, but as it happened his father outlived him), Richard Coeur de Lion, seized Hautefort; thereupon Bertran switched sides, supporting the cause of King Henry and Richard, who returned the castle to him. In a moving poem Bertran would later issue a call to arms for Richard's crusade; in another poem he laments Richard's captivity. Around 1194, Bertran retired to the Cistercian abbey of Notre-Dame de Dalon in

Périgord and stopped all his poetic activity. His son Bertran de Born the Younger was also a troubadour.

For later generations, Bertran's image rested especially on his contentious disposition: *No-m tengatzper acusador/si-us voill c'uns rics l'autre azir,/car meill s'en poiran valvasor/et castellan de lor jausir* ("Don't consider me quarrelsome if I want the mighty to hate each other, for the vassals and the castellans will be able to profit from them"). Dante, in *De vulgari eloquentia* (2.ii.9), makes Bertran the representative in Occitan of the poetry of arms, one of the three subjects worthy of the *volgare illustre* (noble vernacular). An episode in *Divina Commedia* (*Inferno*, 28.118-142) is particularly famous. Among the instigators of fights and wars, Dante meets Bertran de Born carrying his head like a lantern, an appropriate punishment for a criminal who pitted son against father: *Di sè facea a sè stesso lucerna,/Ed eran due in uno, e uno in due* (verses 124-125, "Out of itself it made itself a lamp,/and they were two in one and one in two").

Bestiaries

The primary source for all bestiaries is the scriptures—mostly the Old Testament, which has numerous references to animals of all types. The early church fathers, following the Roman legal tradition, used such biblical references in their sermons partly to establish a precedent, in the form of ancient testimony, for the use of animals as symbols. In the *Homilies* of Saint Basil the Great (sermons 7–9) and in Ambrose's *Hexameron* (9, Books 5-6), animals serve as metaphors for theological lessons. A second reason for turning to the Old Testament was the premise that the Judaic traditions contained hidden prophecies foretelling the events of the Christian era. This concept appears in the earliest bestiary, *Physiologus*, which may date from the second century. Encyclopedic texts such as the *Etymologies* of Isidore of Seville (seventh century) and the Carolingian *De universe* of Hrabanus Maurus, and late medieval writings of Vincent of Beauvais (*Speculum naturale*), Honorius Augustodunensis (*Imago mundis*), Hugh of Saint Victor (*De bestiis*), Albertus Magnus, and Bartholomaeus Anglicus, provide extensive lists of definitions, descriptions, and moralizing comments about creatures of the land and sea. These late medieval authors are contemporaneous with the first specialized, mostly anonymous, texts on animals, known as bestiaries, which became popular in the thirteenth and fourteenth centuries.

Some bestiaries are attributed directly to Albertus Magnus; and Hugh of Fouillooy wrote the first aviary, an offshoot of bestiary compendiums. In the twelfth and thirteenth centuries we can note that some authors

attain a new level of objectivity in the collection and presentation of information; for example, in Albertus we see a growing detachment from the more fantastic elements of the bestiaries and even a desire to measure legends against the actual behavior of animals. Nevertheless, certain moralistic portrayals of animals' behavior—i.e, those based on the writings of the church fathers—were accorded great authority, and they continued, through the fourteenth century, to prevail over the naturalistic presentations found in other bestiaries.

An artistic companion to bestiaries begin to emerge during the Gothic period in the form of drolleries in the marginalia of manuscripts and *bas-de-page* illuminations depicting fantastic beasts and other creatures. However, although such fantastic creatures occupied the pages of many manuscripts, they rarely appeared in the encyclopedias or later bestiaries. In the fourteenth century fantastic tales continued to be conveyed in another type of popular text: travel narratives such as those of Sir John Mandeville and Marco Polo. By the end of the Middle Ages, or more precisely after the 1420s, bestiaries ceased to be produced.

Bevagna

Bevagna, a town in Umbria along the ancient Roman Via Flaminia, was damaged during the barbarian invasions, came under the control of the duchy of Spoleto, and later was an object of special attacks by both Frederick I Barbarossa (1152) and Frederick II (1249). By the fourteenth century, it was under the rule of Perugia. Its primary claim to fame is that, according to tradition, Saint Francis of Assisi gave his famous sermon to the birds along a road that leads from Assisi to Bevagna (Saint Bonaventure, *Legenda maior*, 12.3).

Biadaiolo Illuminator

The anonymous Florentine painter identified as the Biadaiolo Illuminator (fl. c. 1325-c. 1335) is so named after Domenico Lenzi's *Biadaiolo fiorentino*, for which he provided nine illuminations c. 1335 (Florence, Biblioteca Laurenziana, MS Laurenziano-Tempiano 3). Like

others of what has been called the "miniaturist tendency," he traced his artistic roots to the Master of Saint Cecilia by way of Pacino di Bonaguida; and, like the Master of the Cappella Medici Polyptych and the Master of the Dominican Effigies, he responded to the siren song of Bernardo Daddi. Although his small oeuvre includes a few panels, he was essentially a manuscript illuminator in practice as well as in temperament, and in this field he excelled. His illuminations for *Biadaiolo fiorentino* are among the finest ever painted in Florence, combining carefully described details with wry observation and an infectious zest for life. Boldly designed vignettes of places and people jostle and jumble and fairly jump off the pages. A splendid but far from pedantically accurate view of the enemy, Siena, where the poor are being driven out, is juxtaposed with a view of Florence, where the poor are charitably fed but kept safely outside the walls. The *biadaiolo* (corn merchant) himself appears in the midst of a transaction, surrounded by barrels of grain, winnowing baskets, an open account book, and money. On market day, huge, continually replenished barrels are ranged across a square (and almost off the page), and a discriminating Florentine matron and two companions inspect, handle, and sniff the merchandise before deciding whether to heed a vendor's urgings to buy. Observing these negotiations, another man can only scratch his beard.

Such piquant observations and such spirited transcriptions of the doings of humanity are hardly encountered in the few other works attributed to this master. Nevertheless, despite the distinction of the *Biadaiolo* illuminations, it is possible—indeed likely—that the works attributed to the Biadaiolo Illuminator actually form part of the output of the prolific but otherwise more tempered Master of the Dominican Effigies.

Bianco Da Siena

Bianco (c. 1345 or 1350-c. 1412) was born in the small Tuscan community of Anciolina and was taken at an early age to Siena, where he was employed as a wool carder. Most of what we know about his life comes from the writings of Feo Belcari (1410-1484), a Florentine poet and playwright who appears to have reconstructed Bianco's biography from information contained in his poetry. In 1367, Bianco joined the Gesuati, a lay order founded by Giovanni Colombini, and lived for a number of years in a monastery of the order in Citta di Castello. He spent the last years of his life in Venice.

Bianco wrote more than a hundred *laude*, which may be divided thematically into two main groups: doctrinal and mystical. Inspired by intense religious zeal, his poetry has its mystical roots in that of Jacopone da Todi, particularly in regard to the theme of divine madness. The immediacy of Bianco's language and the unadorned simplicity of his statements enhanced the popular appeal of his poetry.

A hymn of praise to the Virgin (340 lines in *terza rima*)—*Benedetta sia tu, che nella mente* ("Blessed are you, who in the mind")—recounts her life in fresh, fervent verses. Some poems focus and play on specific words, phrases, and concepts, creating a mesmerizing effect that aptly reflects their mystical fervor: for example, *Luce divina, luce isplendente* ("Divine light, radiant light") and *Amor amor amor, ardimi il core* ("Love love love, burn my heart"). In another *lauda* Bianco describes the ecstasy of mystical love: *Distruggesi 'l mio core* ("My heart is destroyed"). In still another he presents the lament of a soul bereft of divine grace: *Dolcissimo Amore/quando ti parti, mi lasci inprigione* ("Most sweet Love, when you leave, you leave me in prison"). Such themes are reminiscent of Jacopone.

Bible

Not surprisingly, the Bible—considered the word of God—was the most studied book in the Middle Ages. Nor was its centrality limited to schools, to other writings, or to the relatively few people who understood Latin: as the sacred text of the church, the Bible was the

primary source of all authoritative proclamations. Furthermore, it constituted a complex symbolic network that extended far beyond the reach of words. The "people's Bible" was known through ritual, pageant, and drama; in the iconographic programs of church facades and stained glass; in hymn and song; and, most important of all, in the liturgy of the church. The Bible was seen and heard far more than it was read.

For the learned, however, a particular kind of biblical culture stood at the core of the medieval curriculum and informed all three aspects of the traditional clerical education: *lectio*, the reading of scripture with commentary; *disputatio*, the discussion of questions rising out of problematic texts; and *praedicatio*, the preaching of scripture. Such study was based on certain assumptions: that the Bible was divinely inspired; that there was a typological relationship between what was "figured" in the Old Testament and "fulfilled" in the New Testament; and that the interpretation of scripture was fourfold, with the literal text regarded not only as true in itself but as concealing a set of spiritual mysteries. These assumptions were ancient, having roots in the New Testament's reading of the Old. But in the thirteenth century there were also new developments in biblical study to reckon with. Particularly in university circles, scripture was abstracted in a *summa*, or dissected into a multitude of component parts (called *divisiones per membra varia*), or taken entirely out of its original context and used as an illustrative text or as proof. The practice of amassing parallel passages and chains of citations served to reinforce the notion of the Bible as a source that could be divided and reassembled according to a theologian's needs. This notion was reinforced by the development of an increasing number of research tools to help the scholar and the preacher make more efficient use of biblical texts. There was also the "glossed" text of the scripture itself. For a long time, it had been common practice to insert between lines of the Bible a brief definition or explanation of their meaning. Scribes also added lengthier material taken from the *Glossa ordinaria*, the standard compendium of (largely patristic) commentary on the Bible; this material would be placed in the margins or at the top and bottom of a page.

A discussion of scriptural interpretation raises the question of what the medieval Bible actually was. The answer is complicated, because there were many versions of Saint Jerome's Latin (Vulgate) Bible. If one

had had access to the renowned cathedral library in Verona, for instance, the Bibles one found there would most likely have been multivolume editions, usually of monumental size and lavishly decorated. By contrast, however, there was the *exemplar Parisiensis*, developed in Paris in the early thirteenth century to meet the needs of both the student in a university classroom and the Mendicant preacher on a mission. Its innovative compact one-volume edition continued to influence how the Bible would be presented, even in our own time. These texts, small in size and written on thin parchment, standardized the order of the sacred books and, thanks to Stephen Langton (d. 1228), made chapter divisions that are virtually the same as those used today.

Such material transformations suggest changes in the way scripture was read, and by whom. Whereas stable religious communities continued to favor the large volumes in monastic libraries, the new, more portable texts became the Bibles of the traveling Mendicant orders. Many were indeed small enough to be carried among an itinerant preacher's personal effects. The wide proliferation of these "Paris Bibles" also indicates a growing number of individual (rather than communal) readers—an educated lay elite who gravitated to the universities and the Mendicants' schools, filled administrative positions in church and state alike, and actively used their Bibles in what Vauchez (1993) has called a "diffusion of the evangelical word."

We have evidence that in various parts of Italy during the thirteenth century the Bible was being translated into regional dialects. There were early collections of passages that were read at the mass and in the sacred offices of the church; there were also translations of single books, of which Gerardo Patecchio's *Li proverbi di Salamone* may well be the earliest. Throughout the fourteenth and fifteenth centuries one can identify a gradual formation of a *Bibbia volgare* (though not yet a complete translation of the Vulgate). The Florentine Antonio Brucioli produced a fresh vernacular translation of the original Hebrew and Greek scriptures in 1532, two years before Luther's German translation. Others followed suit.

Throughout the Middle Ages, moreover, there were vernacular verse translations of the historical books of the Hebrew Bible. These were read and sung in public, not unlike the secular courtly romances (*romanzi cavallereschi*). The *podestà* (podesta) of Padova, for instance,

made a verse harmonization of the four gospels at the end of the fourteenth century; some fifty years later a Florentine monk achieved a similar feat in Dante's own *terza rima*.

No doubt the most remarkable Italian commentary on the Bible is Dante's *Commedia*, finished shortly before Dante died in 1321. When Dante's writings are considered as a whole, the Christian scriptures turn out to be the source of more references and allusions than any other work: by one count, there are 575 citations of the Bible, compared with 395 to Aristotle and 192 to Virgil. Moreover, calculations of this sort cannot begin to suggest the extraordinary degree to which Dante absorbed the world of scripture. This is most notable in the *Commedia*, where the Old and New Testaments, both in Latin and in vernacular translation, so permeate Dante's language as almost to become one with it. Sometimes Dante will quote the Bible openly or draw specific attention to its relevance; far more often, however, he allows its presence to go unannounced, relying on the reader to catch the biblical reference and make something of it.

How could Dante, a Florentine layman, attain such a degree of biblical knowledge around the year 1300—and develop such facility in the personal appropriation of scripture? To some extent, Dante was a beneficiary of the Fourth Lateran Council in the early thirteenth century, which attempted to counteract heretical movements and turn the disaffected Catholic laity into people of "right favor and good actions." The newly formed Franciscan and Dominican orders undertook precisely this mission, setting out not only to bring the gospel into streets and public squares but also to offer it in the vernacular. A result of this evangelizing zeal was the formation of a new kind of Christian, the *laicus religiosus*. In Dante's Florence, where both literacy and interest in religion were uncommonly high among the laity, such people might choose to join one of the *laudesi*, or devotional groups, that publicly sang the praises of the Virgin Mary and the other saints. Or they might seek out a charitable organization—a *misericordia*—or join one of the many penitential confraternities affiliated with but structurally independent of the Mendicants. Also, the Franciscans and the Dominicans had "tertiary," or third, orders that offered an even closer connection to the spiritual life of their communities and attracted both men and women. In such circles women and men could find a

more intense Christian life than was possible in the ordinary parish church. Preaching was at the center of this experience; laypeople gathered in the new piazzas built in front of churches to accommodate large numbers, or met together in the more intimate setting of confraternities.

Biblia sacra, cum glossa ordinaria. . . . Exodus, columns 475-476. Lyon, 1589. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Thirteenth-century manuals on *artes praedicandi*—preachers' manuals—emphasized that a sermon should be aimed at a particular audience and should reach out to this audience at an appropriate level. Preaching was to be a kind of song, and the preacher was to be as agreeable as a jester and as sharp as a merchant. Apparently, some the Mendicants actually met these high expectations, although the transcriptions that have come down to us largely omit the amusing stories and asides which made their preaching so popular. A case in point is Giordano da Pisa: more than 700 of his sermons survive; all of them were preached in the vernacular at the beginning of the fourteenth century; and all were taken down by anonymous laypeople who wanted to preserve at least the serious essence what would otherwise have been just a passing moment.

By Dante's own account, we know that he had firsthand familiarity with Mendicant "schools of the religious" (*Convivio* 2.12.7). These were most certainly the *studia generate* of the Mendicant orders, in particular the Franciscans at the church of Santa Croce and the Dominicans at Santa Maria Novella. By the end of the thirteenth century, these two houses of worship were among the most important places of learning in their respective communities, ranked second only to the *studia princi palia* at Paris, Oxford, and Cambridge. Established to train clerics, both schools drew teachers as well as students from all over Europe; and as we know from Dante, they were also open to laypeople.

Biblical Exegesis

At least since Constantine's Edict of Milan in 313, which proclaimed the official tolerance of Christianity within the Roman empire, the collection of writings known as the Bible has occupied a central place in western history and culture. In medieval Italy, the Bible penetrated every aspect of culture and thought; indeed, it is difficult for us to imagine how thorough this penetration was. The Bible provided the subject matter for most visual art, poetry, philosophy, and political science and was the authoritative source of religious doctrine and practice.

The Bible itself was a collection of writings produced in widely separate regions over widely separated periods of time, in cultures and languages largely lost to medieval Europe. Thus, as a text, it presented formidable challenges to the interpreter; it became an object of intense scrutiny which attracted the greatest thinkers and required all their hermeneutic acumen. A huge body of both the theory and the practice of biblical exegesis resulted; and it is impossible to approach the place of the Bible in the Middle Ages without considering how the interpretive tradition shaped the way men and women read this book of books.

The Church Fathers

The theoretical and methodological basis of medieval biblical

interpretation was established by the church fathers, whose scriptural interpretations still provided the most common glosses on the Bible during the Middle Ages. For a medieval thinker, truth was not something discovered through independent investigation; rather, it was something confirmed through textual authority. Thus medieval exegetes looked to the church fathers as the sanctioned interpreters of biblical texts. Saints Augustine, Gregory, and Jerome exerted perhaps the most profound and longest lasting patristic influence. Jerome, a historically minded exegete, is best known for his translation of the Bible from the original Hebrew and Greek texts into Latin; this Vulgate text became the standard Latin Bible in the Middle Ages. For Jerome as well as the other church fathers, biblical interpretation was far more than an academic exercise; it was crucial precisely because it influenced their daily lives. Saint Augustine responded to the hermeneutic chaos of the early church with an attempt to develop an "orthodox" hermeneutics, a theory of interpretation which would ensure that all readings of the biblical text accorded with the mainstream of the church. Augustine therefore rejected the overuse of the Greek method of interpretation known as allegory, which was exemplified in the writings of the Jewish interpreter Philo of Alexandria and the Christian interpreter Origen; instead, he considered the historical sense of the Bible the basis of a proper understanding. Augustine (like Gregory after him) based his own writings on a principle of scriptural interpretation pronounced by Jesus. Noting that the first two commandments of the law were the love of God and the love of one's neighbor, Jesus stated that "on these two commandments dependeth the whole law and the prophets" (Matthew 22:40). For Saint Augustine, therefore, all scripture must have a charitable meaning: passages are to be read literally when they accord with this meaning, and only when an exegete is unable to read a scripture "charitably" should he turn to allegory.

The "Spiritual" Meaning of Scripture

Allegorical readings were justified because of the divine authorship of scripture. Since the Holy Spirit had inspired the authors of the Bible, later interpreters could see in a text a divinely ordained meaning that

was unknown to the original human author. In addition, the deeds recounted in scripture were foreseen by God, who had, in his providence, brought them about so as to signify spiritually. That is, in the Bible *res* (a "thing" or "deed") becomes *signum* (a "sign"); mortal, corporeal events take on incorporeal, spiritual meanings and become "types" of later events in the life of Christ or the history of the church. Saint Gregory, strongly influenced by Origen, bequeathed to the Middle Ages this emphasis on allegorical and typological meaning, and it became the hallmark of most early medieval exegesis. Often, the literal sense of a scripture was neglected in order to concentrate on spiritual truths revealed through allegory.

Early on, different kinds of "spiritual" meaning were distinguished, and exegetes proposed anywhere from two to seven different "senses," or forms of meaning. Eventually, the division of biblical meaning into four different senses became most common; this convention was expressed in a succinct mnemonic Latin couplet attributed to Augustine of Dacia:

*Littera gesta docet; quid credas allegoria;
Moralis quid agas; quo tendas anagogia.*

That is, the literal sense (*littera*) teaches us the "deeds," or emphasizes the historical events recounted in scripture; the allegori

Biblia sacra, cum glossa orinaria . . . , Vol. 5: Gospel of John, columns 1015-1016. Lyon, 1589. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

cal sense shows us what we should believe, or the spiritual doctrines revealed through a figurative understanding of the literal sense; the moral (or "tropological") sense informs us of how we should act; the anagogical sense teaches us, literally, about where we "tend" (or aim or are directed) and thus concerns both the eschatological future of human history and our reward in heaven after this life. Of course, in practice medieval biblical exegesis was rarely if ever so neatly schematized, and

interpreters tended to emphasize the various spiritual senses according to their audience and the context of the scripture.

Indeed, the intended audience of a scriptural study had a decisive impact on what kind of interpretation an exegete would pursue. During the early Middle Ages, for example, much of the biblical study took place in monasteries and formed an integral part of the monastic goal of devoting one's life to God. For a monk, the study of the Bible was a *lectio divina*, in which the scriptures were studied and meditated on in such a way that they would be learned and would become an indelible part of his life: this meditative study would change the monk's heart and mind. Thus the monastic exegete Saint Bernard of Clairvaux begins his *Sermons on the Song of Songs* by remarking that his audience of fellow monks demands a message different from one that might be delivered to people outside the monastery; the message for Bernard's fellows must be suited to those who spend their lives in contemplation of celestial realities. The "contemplative" study of the Bible was a crucial component of biblical exegesis throughout the Middle Ages, even when different methods of scriptural interpretation were advanced and gained prominence in other centers of biblical interpretation, most notably the schools.

Scholastic Exegesis

It was in the schools, particularly the cathedral schools of France, that the Bible began to be studied more systematically and became an object of learning as well as of contemplation. In the French cathedral town of Laon, for example, a need was felt for a summary of existing knowledge about the Bible's meaning. Accordingly, Anselm of Laon (d. 1117), his brother Radalphus (Ralph, d. 1133), and Anselm's student Gilbert Porreta (the Universal, d. 1154) began to summarize the exegetical history of the books of the Bible. The result was *Glossa ordinaria*, an "edition" of the Bible that contained a compendium of patristic and medieval interpretations surrounding the biblical text. This summary of biblical knowledge became important in the developing schools where systematic study of the Bible was undertaken.

The movement known as scholasticism—because it existed primarily

in the schools—approached biblical exegesis with the help of some important Jewish exegetes such as Moses Maimonides, and especially with the aid of the new tools of Aristotelian logic and dialectic that had become available when Aristotle was reintroduced into western Europe. Instrumental in this development was Peter Lombard (who came, as his name indicates, from northern Italy but taught in Paris). Peter's *Sentences*, a theological textbook, made extensive use of dialectic; it took on an importance second only to that of the Bible, and its dialectical method influenced how the Bible was taught and read in the schools. Just as Aristotelian thought accorded greater weight to the physical world, this new method of study looked more closely at literal sense so as to make biblical exegesis accord with the new learning.

Thus the greatest of the scholastic theologians, Saint Thomas Aquinas (who came from the Italian town of Aquino but like Peter Lombard spent most of his career in Paris) recognized four principal senses of scriptural meaning (including the three spiritual senses described above) but also held that all theological arguments must be based on literal sense alone. For Aquinas, though, "literal sense" comprised a greater sense of the text's meaning than it comprises for us. "Literal sense" as Aquinas applied it is best understood as the meaning intended by the author, and the figurative meaning of words that were intended to be read figuratively (as in the case of Jesus's parables) formed part of the literal sense.

Franciscan and Joachimite Exegesis

The "literal sense" was emphasized in a fascinating but ultimately very different way by Saint Francis of Assisi and his order. Francis had set out to imitate Christ as "literally"—that is, as concretely—as possible, and he therefore eschewed any allegorical study of scripture, preferring to dwell on the "humble" literal meaning revealed to the poor and the simple. Franciscan preachers shared this emphasis on the immediate message of the scriptures, although, notably, they stressed the moral weight of the historical examples presented in the Bible, particularly the example of Christ.

One of the most important developments in scriptural exegesis in

medieval Italy primarily concerned the final book of scripture: John's Apocalypse. It derived from the writings and preaching of a Calabrian abbot, Joachim of Fiore (c. 1130 or 1135-1201 or 1202), who had a vision revealing the meaning of the Apocalypse. The traditional Christian view of the Apocalypse was based on Saint Augustine's spiritual reading; Joachim's writings changed the view to a much more "historical" approach, in which the book was studied as a literal guide to the world's unfolding history. Joachim predicted the literal coming of the Antichrist and the beginning of a "third age" in history. His apocalyptic concepts had a profound influence throughout Europe, even though they proved controversial (his doctrine of the Trinity was condemned at the Fourth Lateran Council in 1215). They were particularly important to the Spiritual Franciscans in Italy and elsewhere.

During the fourteenth century, biblical exegesis was displaced from the center of intellectual life, as science became the focus of study in the universities. Laypeople, however, still wrote vernacular devotional literature heavily influenced by the Bible; Dante's *Comedy* is the most famous if least typical example. With the rise of humanism, attention was again deflected away from the Bible to focus on the classics of Rome and Greece. Not until the rise of Christian humanism and the Protestant Reformation and Catholic Counter-Reformation in the sixteenth century did biblical study begin to resume something like its former position in European culture.

Bindo Bonichi

The Sienese poet Bindo (c. 1260-1338) was most probably a merchant by profession and was extremely active throughout his life in civic affairs. Between 1309 and 1318, he was elected one of Siena's nine governors on at least two occasions. However, after his participation in the construction of the Duomo in 1322, he turned his energies away from municipal posts and toward the church; he became a lay brother of Santa Maria della Misericordia in 1327.

Although Bindo was a contemporary of the *stil novo* poets, his literary production owes a great deal more to the school of Guittone d'Arezzo. Among Bindo's extant compositions are moral and satiric poems developed in gnomic style; his love poetry, mentioned in *canzone* 18 of Bilancioni's edition, has unfortunately been entirely lost. Bindo consistently gives attention to the practical aspects of daily life.

His didactic poetry is informed more by mercantile common sense than by profound erudition, and his poems include a far greater number of homespun proverbs than literary allusions. Bindo was relatively well received by nineteenth-century scholars, but his reputation has not endured.

Black Death

"Black death" is the name given by historians to a European pandemic of the late 1340s. Mortality rates varied from place to place, but in general the disease is believed to have killed about one-third of the population of Europe. This plague returned from time to time for the next 400 years; it was especially severe during the seventeenth century and did not disappear from Europe until the early eighteenth century.

The people of the Middle Ages had no scientific framework in which

to place such a sudden and terrible disease, the like of which they had never seen before. Many resorted to religious explanations taken from the Bible, asserting that the "day of the Lord"—the heroic return of Christ to rule earth for a thousand years—was at hand. Kings, princes, and church officials also sought explanations from physicians, who posited natural causes but also turned to astrology. In the Italian city-states, municipal authorities, in consultation with university-educated physicians, instituted public health measures, including quarantine, hospitals, and burial grounds. Church authorities arranged processions of relics and other religious observances. After the plague disappeared, as suddenly and mysteriously as it had begun, chroniclers wrote about the terrible misfortune, and it is from these chronicles that historians have gathered most of their information.

The Onset of the Plague

According to the chronicle of Gabriel de Musis (d. 1356), a notary from Piacenza, plague came to western Europe from Asia Minor. Gabriel relates that in 1346 there was a street fight between Tartar soldiers and Genoese merchants, and the Genoese retreated behind the walls of their trading outpost—Caffa, on the Black Sea—which the Tartars then besieged. At some point the Tartars developed what Gabriel calls a "disease both sudden and unexplainable," and so they abandoned the siege; but they catapulted the bodies of the dead over the walls of Caffa in the hope of spreading the disease among their enemies. The Genoese fled the city by sea, and by October of 1347 they had carried the plague to Messina in Sicily. By January of 1348 it had been spread to Marseilles. Later, in 1348, the plague reached England, and by 1349 it had entered the Low Countries, Vienna, Germany, and Scandinavia.

Boccaccio, in his *Decameron*, describes the plague in Florence in 1348. The disease:

. . . began both in men and women with certain swellings in the groin or under the armpit. . . . In a short space of time these swellings spread . . . all over the body. Soon after this the symptoms changed and black or purple spots appeared on the arms or thighs. . . . Very few recovered; most people died within about three days of the appearance of the swellings.

Boccaccio's description and similar accounts led medical historians to diagnose the black death as bubonic plague, caused by the bacterium *Yersinia pestis*, which was first identified in 1894. However, the modern bubonic plague requires transmission from rodents (usually black rats) via fleas to humans, and the medieval accounts do not mention dead rats; thus the retrospective diagnosis of bubonic plague is difficult to maintain. The true nature of the black death is, therefore, an unsettled question, and most historians now confine themselves to its social and cultural consequences.

Medieval Medical Explanations

Many learned treatises on the causes of the plague appeared throughout the late Middle Ages. The most famous of these, known to historians as the *Paris Consilium*, was written by forty-nine medical masters at the University of Paris in October 1348, at the request of King Philip VI of France. The masters in Paris began by saying that the ultimate cause of the plague would never be known—it was beyond human grasp—but, as natural philosophers, they could look back on recent terrestrial and celestial signs to determine why the plague had attacked when it did. They concluded that it had two causes: one distant and celestial, the other proximate and terrestrial. The celestial cause came from a conjunction of Saturn, Jupiter, and Mars, under the moist sign of Aquarius, that had taken place in 1345, following solar and lunar eclipses. According to Aristotle, they said, the conjunction of Saturn and Jupiter brings disaster; and according to Albert the Great, a conjunction of Jupiter and Mars would bring plague. Jupiter, the sanguine planet, was hot and moist, two qualities that led to rotting or putrefaction; and putrefaction in turn led to the plague, which was considered a kind of fever. The terrestrial or proximate cause was poisoned air from noxious gases released during earthquakes. Evil constellations encouraged thunder, rain, and moist south winds, spreading poisonous vapors emitted from rotting carcasses in swamps. The poisoned air entered the body and went to the heart, which was, according to medieval thinking, an organ of respiration naturally containing air. This air contaminated the body's vital spirit and causes

the organs to rot. Plague did not kill everyone, however, because only certain individuals were predisposed to it by their bodily constitution.

Social Consequences

Perhaps the most profound and troubling social consequence of the plague was a reawakening of anti-Semitism in some parts of Europe. Many people, citing the Book of Revelation, asserted that the Jews had caused the plague by poisoning wells; and despite the efforts of the papacy, with the aid of the surgeon Guy de Chauliac of Montpellier, to discourage this belief, Jews were slaughtered by the thousand. There also seems to have been an increase in the frequency and vehemence of predictions of the Last Judgment. However, recent historians have argued that the effect of the plague on Italian city life was not profound or long-lasting. Municipal documents such as records of births, deaths, and marriages indicate that the disruptions caused by the catastrophe might last a few weeks and then would be followed by a stoic return to normality. The effect of plague on the development of charitable institutions such as hospitals is more difficult to determine; this has been the subject of numerous historical studies.

Bobbio

The Lombard monastery of Bobbio became one of the great centers of culture and learning in the early Middle Ages. It was founded in 613 by the Irish monk Columbanus, who had earlier established three flourishing monastic centers in Gaul—Annegray, Luxeuil, and Fontaines—but had been expelled from the Frankish kingdom in 610 because of his criticism of the clergy and the court. Columbanus had then fled to Lombardy, where he won the favor of the recently converted king, Agilulf. He took up residence in the ruins of an oratory near Piacenza and soon attracted many followers. By the time Columbanus died, in 615, a monastery of considerable size had grown up around the oratory. A nearby stream, the Bobi, gave the community its name. Columbanus brought to this new monastery the same high standards of ascetic discipline and learning that he had established at his Frankish monasteries. The rule he wrote remained the norm of life at Bobbio until the early tenth century (with some alterations made in 643 to accommodate Benedictine practice).

Columbanus's immediate successors pursued his ideals with great energy. Attala (from 614 to 627), Bertulf (627-640), and Boboleno (641–654) rigorously maintained the monastery's piety and learning and focused the monks' attention on converting the Lombards from Arianism. The acceptance of Catholicism by the Lombard king and court in 653 led to a significant increase in royal patronage, Bertulf and Boboleno also ensured the stability and independence of the monastery

by obtaining from the monarchy an affirmation of the original donation of land made to Columbanus, and obtaining from the papacy an exemption from episcopal jurisdiction.

Over time, Bobbio developed into a major seat of learning. Its formative cultural influences came from Ireland and Gaul, not only because most of its early monks were northerners but also because the monastery became a place of pilgrimage for Irish and Gallic monks who wanted to visit the tomb of Columbanus. Pilgrims to Rome also used it as a stopover. This northern influence helped make Bobbio—unlike most other Italian monasteries of the time—an important intellectual center.

Bobbio's original library was modest and was stocked only with theological and exegetical works, but it grew steadily, especially under Boboleno. There is no evidence that Bobbio acquired manuscripts from other libraries, as is sometimes maintained. Most additions seem to have been the work of Bobbio's industrious scriptorium. The Irish dominated this early writing school, although Spanish and Gallic influences were also strong. Toward the end of the seventh century profane as well as ecclesiastical works began to be copied, especially glossaries, treatises on grammar and meter, and extracts from philologists and historians. This was due in part to the influence of the Gallic, British, and Irish monks who constantly visited the monastery, and in part to a revival of arts and letters in the schools of Pavia, the nearby Lombard capital. From this point on the library's holdings continued to grow; by the late tenth century there were nearly 700 volumes.

Between the Carolingian Renaissance and the twelfth century Bobbio was arguably the dominant cultural center in Italy, primarily because of its library. It also gained considerable wealth. In 1014, the German emperor Henry II persuaded Pope Benedict VIII to make Bobbio an episcopal see. The ensuing jurisdictional disputes between bishops and monks are sometimes blamed for a gradual decline in spiritual observances and intellectual pursuits at Bobbio. In 1449, the monastery was annexed by the Benedictine congregation of Santa Giustina in Padua. The library suffered serious losses in the seventeenth century and was dispersed by the French in 1795. Some of its manuscripts can now be found in the Vatican Library, the Ambrosian Library in Milan,

and the National Library in Turin.

Bocca Degli Abati

The Abati of thirteenth-century Florence were Ghibelline nobles involved, inter alia, in money lending, and were routinely knights of the Golden Spur. According to the will of his son, Schiatta, Bocca (d. before 1300) was the son of Rainieri Rustici.

After Florence expelled its leading Ghibellines in 1258, Bocca remained behind with other disaffected noblemen, and he rode with the Guelf force against Siena in August 1260 at the Battle of Montaperti. At this point Bocca entered history and local infamy. According to Florentine tradition, represented here by the historian Giovanni Villani (c. 1275-1348):

As the troop of Germans violently clashed with the troop of Florentine knights, whose standard-bearer was messer Iacopo del Nacca of the house of Pazzi of Florence, a man of great valor, the traitor messer Bocca degli Abati, who was very close [to Iacopo] in his troop, with his sword struck the said IacoDO and cut off the hand with which he carried the banner.

(*Cronica*, Book 6)

The Florentine cavalry wavered and then fled, leaving the infantry to be slaughtered. For this deed Dante placed Bocca in the company of traitors in the lowest circle of hell, Antenora (*Inferno*, 32.73-123). Frozen up to his neck, Bocca is accidentally kicked in the face by the poet. The actual Bocca apparently escaped from the battlefield; he appears in

Florentine documents dated 1268 and 1280.

Boccaccio, Giovanni

Boccaccio (1313-1375) is now best known as the author of the *Decameron*; but he wrote many works very different in kind, and in the century following his death he was most famous as a humanist and a herald of the Renaissance. He was the illegitimate son of a businessman, Boccaccino di Chelino, and a mother whose name is unknown to us, and he spent his earliest years in or near Florence. Boccaccino encouraged his son's education, but not along the lines of Boccaccio's own interests. In *Genealogie deorum gentilium* (*Genealogy of the Pagan Gods*), Boccaccio says:

Even in my boyhood [my father] directed all my endeavors towards business. As a mere child, he put me in the charge of a great business man for instruction in arithmetic. For six years I did nothing but waste irrevocable time. Then, as there seemed to be some indication that I was more disposed to literary pursuits, this same father decided that I should study for holy orders, as a good way to get rich. My teacher was famous, but I wasted under him almost as much time as before.... I turned out neither a business man, nor a canon-lawyer, and missed being a good poet besides. (*Boccaccio on Poetry*, trans. Osgood, 1930, 131-132).

Around 1327, when Boccaccio was fourteen, he moved to Naples, where his father worked as an agent of the Bardi bank at the royal court. The French court and the busy port of Naples offered Boccaccio a wide new range of educational experiences to complement the hours he spent in unwanted studies. Cino da Pistoia, who taught him law, may well have encouraged Boccaccio's interest in poetry, showing him writings by Dante and other recent poets. (One of Cino's lyrics appears as a song in Boccaccio's *Filostrato*.) Boccaccio was also befriended by a circle of Petrarch's acquaintances, including Barbato, Giovanni Barrili, and the Augustinian father Dionigi di Borgo San Sepolcro. Paolo da Perugia, the king's librarian, contributed a more classical education; Paolo, with the help of Barlaam's knowledge of Greek, was collecting materials on ancient mythology that later became the basis for Boccaccio's *Genealogie*.

Boccaccio began to try his hand at literature while still pursuing other studies. His apprenticeship in the classics is shown in his earliest endeavors, preserved in his notebooks: *Elegia di Costanza* (in verse), paraphrasing a classical epitaph; and *Allegan a mitologica* (*Mythological Allegory*, in prose), a brief and highly artificial string of mythical references from Ovid used to prefigure Christian history. He turned to Dante's *serventese* as the model for *Caccia di Diana* (1334?)—an ambiguous title which can mean either Diana's hunt or the chasing away of Diana. Here, the verses describe a hunt for various beasts by fifty-nine beautiful women of Naples and their leader, Diana; the women then transfer their allegiance to Venus, who turns the beasts into men. The problem of how to understand Boccaccio's work begins with the start of his career: *Caccia* has been read as an elegant compliment, as Christian allegory, and as ironic satire.

Il Filocolo (1335-1336?), a long, ambitious romance about separated lovers, reveals that many influences were working on Boccaccio. It is filled with idyllic descriptions of Neapolitan gatherings and with plots popular at the French court, but he also includes classical gods, metamorphoses, significant Greek names, and numerous echoes of Dante. Boccaccio presents *Filocolo* as a written version of an oral tale, and *cantari* on Florio's search for Biancifiore do exist; however, Boccaccio frames that story in a broader history of the conversion of Florio, and Europe, to Christianity. The most famous scene is a debate

on questions of love in a Neapolitan garden (4.14-72); two of the questions reappear in the *Decameron* as tales 4 and 5 of the tenth day.

Il Filostrato seems to have been written at about the same time as *Il Filocolo*, perhaps in 1335; however, the language of *Filostrato* is much more fluent and humorous than the artificially elaborate prose of *Filocolo*, and one scholar has therefore suggested a later date. *Filostrato* became the model for Chaucer's *Troilus and Criseyde*. Its nine books of *ottava rima* stanzas tell of the Trojan prince Troiolo's love for Criseida; the seduction, aided by her uncle, Pandaro; her betrayal of Troiolo for the Greek Diomedes; and Troiolo's despairing death. Boccaccio seems to have associated the number nine with tragedy: he also uses nine books in *Elegia di madonna Fiammetta* and in *De casibus virorum illustrium* (*Fall of Illustrious Men*).

Giovanni Boccaccio, *Il Filocolo*. Venice: Lucio Spineda, 1612. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

For *Teseida delle nozze di Emilia* (1340-1341), twelve-book romance-epic, Boccaccio again drew on classical history, this time continuing Statius's *Thebaid*. He described *Teseida* as the first martial poem in Italian. It begins with Theseus's conquest of the Amazons and tells of two Theban knights' rivalry for the love of the Amazon Emilia, whom

they first see from their prison window. Theseus arranges a tournament to decide which one is to marry her. Boccaccio appended notes to educate his readers about Greek myths and customs, and he tried to base his description of the games and the arena on classical accounts. His famous glosses to the temples of Venus and Mars in Book 7 suggest that the work may be read allegorically, since these two deities represent concupiscence and irascibility. The work became a basis for Chaucer's "Knight's Tale."

By the time he finished *Teseida*, Boccaccio had been forced by business troubles to return with his father to Florence (1341). The move back to Florence is described in depressing terms at the end of *Comedia delle ninfe fiorentine* (*Comedy of the Florentine Nymphs*, 1341–1342); Boccaccio remained nostalgic for the cultural brilliance of Naples, and he tried several times to return there to live, but disappointing circumstances repeatedly forced him to abandon this aim. However, the return to Florence did not interrupt his writing. Within a year he had produced two pastoral works. One, a pair of Latin eclogues, would become the first two poems of *Buccolicum carmen*, written over many years and completed shortly before his death. The other was *Comedia delle ninfe fiorentine*. In this allegory, the shepherd Ameto overhears seven nymphs (virtues) tell, each in turn, how they won over their lovers (vices). Then Ameto is stripped of his animal skins and baptized, and he realizes that the nymphs he lusted for are even more desirable as moral virtues. Venus descends, announcing herself as the triune god, while the nymphs sing, in veiled terms, of the mysteries of Christian belief. The title and plot of *Comedia delle ninfe fiorentine*, the use of *terza rima*, and the usual borrowings of phrases show Boccaccio's indebtedness to Dante. Yet Boccaccio's work is radically new in kind, and it was to be a major influence on the uses of the pastoral mode during the Renaissance. Its alternation of prose narrative with verse provided a model for Sannazaro's *Arcadia*.

Boethius's *Consolation of Philosophy* and the *Roman de la Rose* as well as Dante were the major sources for *Amorosa visione* (*Amorous Vision*, 1342). In this dream vision, the narrator must choose between a narrow flight of ascending stairs and a broad doorway into a palace. A heavenly guide follows the narrator into the palace, commenting on the murals he sees painted there—triumphs of wisdom, glory, wealth, love,

and fortune. The notion of a series of triumphs and the catalogs of figures in them inspired Petrarch's *Trionfi* and many Renaissance paintings. In *Amorosa visione* three poems run as an acrostic down the entire length of the work, spelled out by the first letter of each tercet; Boccaccio's own name appears in the acrostic at the point where he sees his beloved painted in love's triumph. Boccaccio circulated a manuscript into which he had copied *Caccia di Diana*, the lyric *Contento quasi*, and *Amorosa visione*, all in *terza rima*.

Meanwhile Petrarch, recently made the laureate at Naples (1341), was stirring the enthusiasm of literary circles. Boccaccio composed a brief Latin life, *De vita et moribus domini Francisci Petracchi* (1341 — 1342), noting that no poet had been crowned at Rome since late antiquity but praising Petrarch's Italian lyrics as well as his Latin endeavors. Boccaccio wrote that if souls were reincarnated, people would think of Petrarch as the reincarnation of Virgil. Clearly, excitement over a revival of ancient culture had much to do with Boccaccio's own enthusiasm.

In 1343–1344, Boccaccio was once again experimenting with a new kind of work; the result—*Elegia di madonna Fiammetta* (*Elegy of Lady Fiammetta*)—has been considered one of the first novels. *Elegia* is narrated by Fiammetta, a young married woman of Naples; she tells of her falling in love, the departure of her beloved, and his failure to return despite his promises. Small events evoke long psychological reactions as Fiammetta's alternating hope and depression lead her ever deeper into despair. Her attempted suicide is foiled, and she writes her book both to warn other women and to glory in her own tragedy. As in the earlier works, descriptions of real life are mingled with mythical references; and psychological realism coexists with hints of a moral allegory about passion and reason. Venus is associated with the Fury Tisiphone, and in a sense we witness Fiammetta's descent into hell (there are echoes of Dante's *Inferno*)—a hell of misery, violence, hypocrisy, and stubborn pride. Ovid's *Heroides* and Seneca's tragedies, especially *Phaedra* and *Hippolytus*, were important sources for this work.

Boccaccio had used the name Fiammetta for his beloved in earlier books (*Filocolo*, *Teseida*, *Comedia delle ninfe*, and *Amorosa visione*); however, her identity changed from work to work—she was a daughter

of the king of Naples from before or after his coronation, a nymph, and a descendent of Aquinas. In *Elegia* she is a middle-class Neapolitan, and her unhappy love mirrors the unhappiness of her lover in the earlier works. His is the pain of unrequited desire; hers the pain of having been seduced and abandoned. Her name will appear once more, in the *Decameron*—where, as a Florentine, she is one of the narrators, ruling the day of love stories with happy endings. It is worth noting that most of these happy endings consist in marriage.

Marriage is also celebrated in *Ninfale fiesolano* (1344-1346?), an Ovidian pastoral narrative about the love of the country boy Africo and one of Diana's nymphs, Mensola. Diana turns the pregnant Mensola into a stream in the Tuscan countryside; and Africo, who commits suicide, gives his name to another stream nearby. Both Venus's advocacy of rape and Diana's insistence on chastity yield before social marriage, however, as Africo and Mensola's son grows up, marries, and sires citizens of the new community, Fiesole. The work ends with a rapid history of the origins of and relations between Fiesole and Florence. As in *Filostrato*, clarity and lightness of language go hand in hand with the use of stanzas of *ottava rima*; if Boccaccio did not invent this form, he established it as a graceful and effective mode of narrative, taken up by poets of the Renaissance. The adoption of Ovidian metamorphoses to mythicize features of the local landscape is another feature that became immensely popular.

The mid-1340s saw political turmoil and violence in Florence, along with the failure of Florentine banks. Perhaps to escape all this, Boccaccio lived for a while (1345-1346?) in Ravenna; he dedicated his translation of Livy's fourth decade to its ruler, Ostasio da Polenta. He next spent a short time (1347-1348?) in Forlì. Naples was then undergoing a period of chaos: the king of Hungary invaded it to avenge the death of his brother Andrew, who had been the husband of the queen of Naples and had been mysteriously murdered. Francesco Ordelaffi, lord of Forlì, wanted to join the Hungarian expedition and nearly took Boccaccio along. Boccaccio wrote several Latin eclogues on the situation in Naples; he was at first critical of the Neapolitans but was later outraged by the brutality of the king of Hungary.

Boccaccio was back in Florence when the dreadful plague of 1348 struck. Both his father and his stepmother died, leaving Boccaccio

responsible for the remaining family and its property. The death of between one-third and half of the population of Florence, and the survivors' fear of contagion, caused a temporary breakdown of Florentine society. Out of this terrible experience came the *Decameron* (1349-1351), whose ten narrators flee the plague, take refuge in their villas in the hills, and tell each other stories for ten days, ending each day with a song. (Activities such as singing and telling comic tales were actually recommended by doctors to preserve the balance of humors and thus prevent disease.) The hundred tales are "retold" by Boccaccio for women who are obsessed by love and unable to distract themselves as men can. (There are echoes here of Ovid's *Remedia amoris*.) By chasing away their melancholy, Boccaccio hopes to restore their mental health. The Dantean journey from the pestilential city to a garden which resembles an earthly paradise suggests a moral as well as a physical meaning. Yet the layering of narrative voices (the real Boccaccio, the inscribed "I", the narrators, and often characters telling tales within tales) complicates the possible interpretations. As with Boccaccio's earlier writings, critics have disagreed about how to read this work. Some have seen it as championing the rights of "nature" against social morality; others as teaching Christian morals; others as rejecting any moral function of literature in favor of aesthetic pleasure; others as intentionally thwarting any possibility of fixed meaning. The *Decameron* has been considered feminist and misogynist, radical and conservative, conducive to the reordering of society after its breakdown and subversive of established order.

In writing the *Decameron* Boccaccio drew on a complex mixture of popular and literary sources. Proverbs and tales from the oral tradition; recent events and anecdotes; evocations of Dante; and classical narratives by Ovid, Apuleius, and Valerius Maximus all merge in a rich work that has been called the "human comedy." Although many of the tales take place in Italian towns in Boccaccio's own time or the recent past, there are also other settings, including the Orient and ancient Athens. Branca (1976) has suggested that the wandering knights of romance have been replaced here by wandering merchants who encounter everything from prostitutes to disguised princesses.

Each day (except days 1 and 9) is assigned a topic, so that the tales interact as variations on a theme, while Dioneo's final tale on each day

often parodies the preceding stories. The topics are also linked: the power of fortune is followed by the achievement of one's desires; unhappy love stories are followed by happy ones; tricks by women against men are followed by the deceits of humans generally against each other; and the final topic, magnanimous behavior, is introduced as a corrective to all that has gone before.

This collection had an enormous influence on prose fiction throughout Europe for the next several centuries. The major themes of the *Decameron*—fortune, love, trickery, the deceits of women, the hypocrisy of clergymen—became those of a genre called the *novella*. Another feature, the framing tale, was also copied, with variations. Dramatists found the *Decameron* a wonderful source of plots. Boccaccio's prose—combining formal Latinate syntax with lively, realistic dialogue—established a standard for Italian prose, just as Petrarch became the model for Italian poetry. However, unlike Petrarch, who denigrated Italian and encouraged writing in Latin, Boccaccio defended Italian as a literary language. His admiration for Dante, whose *Commedia* he sent to Petrarch with exhortations not to scorn it, undoubtedly persuaded him of the potential power and range of the vernacular.

In October 1350, Petrarch came to Florence, and Boccaccio went outside the gates of town to meet him and invite him home. This was the beginning of a deep friendship that lasted to the end of their lives, and many of their letters to each other are still extant.

From 1350 on, Boccaccio became more and more involved in public life. He was given responsible offices within the city and was sent on sensitive embassies abroad, including one to the pope in Avignon in 1354. In 1355, he made one of his disappointing trips to Naples; during this journey, the best beloved of his five illegitimate children died—the little girl whom he affectionately memorialized in his eclogue *Olympia*. (All five children seem to have died very young.) At the rich library of Monte Cassino, he copied a number of classical texts, because he was beginning to work on his own historical volumes: *Genealogy of the Pagan Gods*, *The Fall of Illustrious Men*, and the geographical dictionary *Of Mountains, Forests, . . . and Seas* (*De mon tibus . . .*). All these works took many years to complete. They reflect Boccaccio's more humanistic, scholarly side, which was encouraged by Petrarch and was

highly valued by the humanists of the following century.

In the early 1350s, Boccaccio wrote, in Italian, *Trattatello in laude di Dante* (*Little Treatise in Praise of Dante*) for a manuscript in which he copied all the known poetry of Dante; this collection became a major source for the transmission of Dante's verse. *Tratatello*, which was revised several times (c. 1360 and before 1372), was a celebration as well as a biography, offered in lieu of the ancients' physical monuments to great men. Boccaccio praises Dante as a poet-theologian and discusses poetic theory but also passes on popular anecdotes about Dante and describes his appearance and manners.

Boccaccio's last work of Italian fiction, *Corbaccio* (*Ola Crow*, 1355 or perhaps 1365), is a dream vision in which a mocked lover, the narrator, encounters the ghost of his lady's husband. The ghost reveals the wife as evil, turning the narrator's love into hatred, and urges him to compose a work that will bring the woman shame instead of glory. This misogynistic tirade has left readers perplexed. Some see it as angry, but others see it as humorous—as a work meant to show us the narrator's double error, first in falling in love and then in swerving to the opposite extreme. Still others see it as a moral lesson. On the one hand, the husband has been taken as Boccaccio's mouthpiece; on the other hand, the husband has been seen as an infernal ghost who seeks to bring his rival to harm. The title has been seen as referring to the widow, to the husband, to lust, and to the harsh voiced book as a whole. The form of the book, a dream vision, is reminiscent of *Amorosa visione*, which Boccaccio was simultaneously revising.

Genealogie deorum gentilium (*Genealogy of the Pagan Gods*), first circulated c. 1360 but revised in 1372, contains further reflections on poetry. In its fifteen books, classical myths are organized according to major gods and their descendants. The myths are then glossed; but although they are given natural, historical, or moral meanings, they are not Christianized. Boccaccio had frequently used classical myths in order to formulate Christian meanings, but here he was concerned to discover what the ancients themselves might have meant by these tales. The final two books contain a defense of literature and of the study of pagan writings. The work remained a basic source about mythology for writers and artists of the Renaissance.

De casibus virorum illustrium (*The Fates of Illustrious Men*) was

finished c. 1360 but was enlarged later (1373-1374). It offers a series of examples of the instability of worldly glory, running all the way from Adam through King Arthur to contemporary cases but mainly emphasizing classical history. Inserted among these examples are famous chapters on the praise of poverty, the combat between Poverty and Fortune, the defense of literature, the nature of dreams, and other topics. The work became known in England through Lydgate's *Fall of Princes*.

Boccaccio also took up the case of women, protesting against their neglect by other historians, including Petrarch. *De mulieribus claris* (*On Famous Women*), written and revised several times between 1361 and 1375, presents biographies from Eve to Queen Giovanna of Naples, i.e., it covers the same span of time as *De casibus*. In *Genealogie*, Boccaccio had given historical readings of some myths; similarly, in *De mulieribus claris* he assumes that classical goddesses were human women deified for their contributions to human life; thus Ceres, for example, is considered an early teacher of agriculture. Boccaccio finds far fewer women to praise in his own time than in the past. He celebrates ancient women writers for their intellectual pursuits, exhorting his contemporaries not to let their minds lie idle. Christine de Pizan reworked these histories into her feminist *Book of the City of Ladies*.

During the political crisis in Florence in 1360, several of Boccaccio's friends were exiled or killed. He himself withdrew from Florence to Certaldo c. 1365. In a letter of consolation (1361 – 1362) to his exiled friend Pino de' Rossi, Boccaccio declares the advent of a new era: the path of the ancients, long overgrown, has been cleared by Petrarch, and others may now follow in his steps. This sense of a new opening also appears in Boccaccio's praise of Giotto (*Decameron*, 6.5) for reviving an art long dead. Boccaccio himself also participated in launching this new era, reviving classical forms, themes, and histories. In contrast to his usual humility, *Genealogie* contains his one boast—that he had revived Greek studies (15.7):

Was it not I who intercepted Leontius Pilatus on his way from Venice to the western Babylon [Avignon] . . .? Did I not make the utmost effort personally that he should be appointed professor [of Greek] in Florence, and his salary paid out of the city's funds [1360-1362]? Indeed I did; and I too was the first who, at my own expense, called back to Tuscany the writings

of Homer and of other Greek authors, whence they had departed many centuries before, never meanwhile to return.... I, too, was the first to hear Leontius privately render the *Iliad* in Latin [1359–1360]; and I it was who tried to arrange public readings from Homer.

Devotion to the classics, as Boccaccio argued in *Genealogie*, was in no way anti-Christian. In 1360–1361, the pope gave Boccaccio a full dispensation for his illegitimate birth, enabling him to hold some church office or benefice that probably provided him with an income. Nonetheless, a message in 1362 from the holy man Pietro Petroni, warning Petrarch and Boccaccio to turn from literature to God or risk damnation, caused Boccaccio serious misgivings. His fears were calmed by Petrarch, who argued that although intellectual pursuits are not necessary to salvation, they offer a higher way than simple faith. Petrarch even invited Boccaccio to live with him, but Boccaccio preferred to remain independent.

In 1363, Boccaccio did accept an invitation to live at the court of Naples, bringing *De mulieribus* and probably *De casibus* with him as a gift. His illusion of ending his days comfortably as a great man at the court were quickly shattered, however. In an angry letter, he complained of having been lodged and fed with lowly servants and forced to follow the seneschal, Niccolo Acciaiuoli, around in his constant travels, making study impossible; as a final insult, he had even been left behind by the entourage. After a consoling visit with Petrarch in Venice, Boccaccio returned to Certaldo bitterly confirmed in his preference for impoverished independence. His public duties for Florence resumed in 1365.

Besides Boccaccio's prose and verse narratives, 126 of his securely attributed lyric poems remain. They were written throughout his life on such topics as love, religion, and poetry and were never assembled into any fixed collection. (Nearly fifty poems less surely attributed to him have also been published.) The influence of Ovid, the *stilnovisti*, and Petrarch is recognizable in many of Boccaccio's verses. Around 1370, Boccaccio circulated his completed *Carmen buccolicum*: sixteen diverse Latin eclogues on amatory, political, moral, literary, and religious matters. Three of the later eclogues present a hell, paradise, and purgatory clearly inspired by Dante's. Boccaccio also copied together into one manuscript the eclogues of Virgil, Petrarch, Dante, Giovanni

del Vir gilio, Checco di Meletto de' Rossi, and his own; this anthology of pastoral verse contributed to the subsequent popularity of the genre.

In 1373, Boccaccio was invited to give the first public lectures in Florence on Dante's *Commedia*. These lectures were interrupted by his illness during the following year; moreover, Boccaccio expressed his concern, in several sonnets (122-125), that he might be prostituting the muses by exposing Dante's poetry to the crowds. His written *Esposizioni* (*Commentaries*), divided into literal and allegorical explanations, break off at *Inferno* 17. In the midst of his own illness, Boccaccio received news of Petrarch's death (July 1374), and he mourned Petrarch in Italian verse. Near the end of Boccaccio's life, one of his most devoted friends was Coluccio Salutati, who was to be important to the next generation of humanists. On 21 December 1375, Boccaccio died at Certaldo, leaving his books to the Augustinians of Santo Spirito. He had composed his own epitaph:

*Beneath this stone lie the ashes and bones of Giovanni;
His spirit sits before God adorned with the merits of the labors
Of his mortal life. His father was Boccaccio,
His home Certaldo, his eager study was nourishing poetry.*

Boethius

The Roman philosopher Anicius Manlius Severinus Boethius (c. 480-524) was a near contemporary of Saint Benedict and Cassiodorus. He was born into a famous Roman senatorial family, and on his father's early death was adopted into another at least as renowned, Q. Aurelius Memmius Symmachus took the young boy under his wing and brought

him into a circle of privilege and power. Boethius married Symmachus's daughter Rusticana, with whom he had two sons. Driven perhaps by the Platonic ideal of the philosopher-king, Boethius took a public office as consul in 510. His sense of earthly fulfillment may have peaked in 523, when he was appointed master of the offices (a sort of prime minister and chief of staff) by the Ostrogothic king Theodoric at Ravenna, the outpost capital of the western empire.

Then fortune's wheel took its inevitable turn. Although Theodoric himself was an Arian, his reign had been marked by religious tolerance and deference to the traditions of the ancient Roman senatorial class; now, however, he seems to have grown suspicious of a collusion between Roman aristocrats and the imperial authority in Constantinople. In an atmosphere of fear and mutual recrimination, Boethius's principled defense of a fellow senator led to his own downfall. He composed his famous *Consolation of Philosophy* (*De consolazione philosophiae*, c. 524-526) while he was under arrest in Pavia and awaiting execution. Eventually canonized as Saint Severinus, he is buried (like Saint Augustine) in San Pietro in Cielo d'Oro at Pavia.

In the history of ideas, Boethius is perhaps the most significant of a small handful of thinkers in his time who transmitted the world of ancient Greek and Roman learning to the Middle Ages. One of the last pre-Renaissance intellectuals to command a thorough knowledge of Greek philosophy in the original language, he was convinced of a fundamental harmony between Aristotle and Plato and set out to convey this through a comprehensive program of Latin translations. Today we have his translations and commentaries on Aristotle's logical works (principally *Categories*, *De interpretatione*, and *Prior Analytics*); his original works on the categorical and hypothetical syllogism; and his translation of Porphyry's *Isagoge*, a major work of Alexandrian Neoplatonism that introduced the vexed question of universals into medieval philosophy. Boethius was also very much concerned with the survival of the liberal arts curriculum in Latin. Although his *De arithmetica* was substantially derived from Nicomachus of Gerasa (second century), it includes an illuminating excursus on the profound interrelationship among the mathematical arts: arithmetic, music, geometry, and astronomy—four connected paths of study for which, it appears, Boethius here coined the term *quadrivium*. Like Augustine,

Boethius wrote an influential treatise on music as Pythagorean number theory that became a standard during the Renaissance.

The extent of Augustine's influence on Boethius, and particularly on Boethius's doctrines of the Trinity as expounded in the theological tracts, or *opuscula sacra*, remains a matter of some discussion among scholars; more generally, the precise nature of Boethius's Catholicism is also a matter of scholarly discussion. In his sophisticated disquisitions on classical learning, Boethius seems utterly unconcerned with their relation to the Christian faith; and he writes as something of a detached logician even in his avowedly theological works (among others, *De trinitate*, *De fide catholica*, and a tract against the heresies of Eutyches and Nestorius). His crowning achievement, *The Consolation of Philosophy*, is marked by this same bracketing off of the Christian perspective.

In the *Consolation*, Boethius—like Dante—casts himself as the protagonist. As he languishes in prison lamenting his ill fortune and lost glory, a magnificent lady, Philosophia, appears to instruct and console him by reminding him of the eternal Platonic truths. She chides him for having invested himself in the transient and temporal; she coaxes him toward an appreciation of rational design in the universe; she reaffirms the lasting good of the human soul in contemplative union with divine form. Though reflecting in part both Stoic and Aristotelian science, the *Consolation* makes plain its author's strong Neoplatonic tendencies, particularly in the ninth meter of Book 3, *O qui perpetua mundum ratione gubernas*, a brilliant lyric distillation of Plato's *Timaeus*. At once appealing as moral philosophy and as literature, Boethius's elegant Latin *prosimetrum* (five books of alternating verse and prose) enjoyed huge popularity throughout medieval Europe and was translated into all the major vernaculars, including Italian, by 1500. His personifications of Philosophy and Fortune began a long and colorful iconographic tradition.

Dante, whose *Convivio* echoes the *Consolation* in many places, surely felt an affinity for Boethius as a fellow martyr for the truth and a fellow exile. In *Paradiso* 10, Boethius is shown among the contemplatives in eternal beatitude.

Bohemond of Taranto

Bohemond (or Bohemund; Bohemond I, prince of Antioch, c. 1050 or 1058-1111) was the eldest son of Robert Guiscard by Robert's first wife, Alberada. He developed in the shadow of his father's transformation from a Norman brigand-mercenary to the founder, as duke of Apulia, of a powerful new state in southern Italy. Bohemond emerged early as his father's chief lieutenant, notably during Robert Guiscard's daring invasion of the Byzantine empire in the early 1080s.

Bohemond was bypassed in the succession to his father's Apulian realm in favor of Roger Borsa, Robert's eldest son by his second wife. However, Bohemond forcibly extorted from his half-brother a territorial enclave that included Bari. Beyond that, he had inherited his father's grandiose dream of carving out a realm in the east at the expense of

Byzantium. The great project that was to become the First Crusade was clearly a perfect opportunity for Bohemond. When Pope Urban II called for crusaders to champion Christendom against Islam, Bohemond was among the western barons who responded. He was an archetype of the self-seeking opportunist, hungry for a principality of his own in the east.

Bohemond set out in the autumn of 1096 for Constantinople, where the crusaders had agreed to meet. The Byzantines, who knew him all too well, inevitably suspected that he had ulterior motives; but Bohemond went out of his way to be deferential to Emperor Alexius I Comnenus (Alexios Komnenos). Pledging loyalty, he sought for himself the Byzantine post of *domestikos* of the east, and he became a leading negotiator between the crusaders and Alexius. He accepted Alexius's terms—an oath of fealty and a promise to surrender to the emperor any conquered cities or lands that had previously belonged to the empire—but Alexius had no illusions about Bohemond's sincerity or goals. As the expedition proceeded beyond the taking of Nicaea, Bohemond's self-interest became increasingly evident, and at a very early point he seems to have set his sights on the important Syrian city of Antioch, one particularly desired by Alexius. Bohemond was a leader in the prolonged, brutal siege of Antioch (1097-1098), and by clever manipulation he was able to secure its surrender to himself. He refused to share it with the other leaders, and—by now outspoken in his hostility to Alexius—he made it the center of his own principality. Bohemond remained in Antioch while the rest of the crusaders' forces went on to storm Jerusalem (1099).

Bohemond soon found himself beleaguered by both Byzantines and Turks; he was even briefly taken prisoner by the Turks, and he felt that his hold on Antioch was precarious. Convinced that Alexius was his supreme obstacle, Bohemond developed a characteristically daring scheme of attacking Byzantium directly, in his father's pattern. In 1104, he left behind his nephew and longtime deputy, Tancred, to hold Antioch, and secretly had himself conveyed back to Europe. (A story is told that, to avoid interception by Byzantine squadrons, Bohemond gave out the report that he was dead and then spent much of the voyage in a coffin, along with a dead chicken to add olfactory verisimilitude.) In Rome he convinced the gullible Pope Paschal II of

Alexius's treachery and animosity to the crusade and was given a blessing to organize a force to attack Byzantine lands, disseminating vicious propaganda against Alexius in the process. Bohemond made a landing at Avlona in October 1107 but was quickly contained by Alexius at Dyracchium. Compelled to surrender, Bohemond signed a humiliating treaty with Alexius in September 1108, once again accepting Byzantine suzerainty over Antioch. Bohemond never returned to his hard-won principality; shortly after making this treaty, he died, perhaps in Bari. Tancred refused to recognize the treaty of 1108 and thus initiated an independent Norman rule in Antioch that would last for the next few generations.

Bohemond was buried in a curious tomb, of either Muslim or crusader design, still to be seen outside the *duomo* in the town of Canosa di Puglia. On its bronze door there is an inscription of fulsome praise to this restless but ultimately futile Norman prince.

Bologna

The town of Bologna sits on the edge of the fertile plain of the Po River at its intersection with the Apennines. The site is an important junction of the roads and waterways connecting Lombard/ and the Romagna with the Veneto and Tuscany. Bologna became the home of the most important school of legal studies in Europe and a center of political and institutional innovation for much of the thirteenth century. Remarkably, guilds representing the town's artisans held a share of power for a century, 1228–1327. From the 1270s on, Bologna was torn by factional civil wars. The town faded in size and influence and fell repeatedly to the rule of *signori*, the Visconti, and the papacy. In the fifteenth century the Bentivoglio family established a long-lasting *signoria*.

Early History

Bologna is on the site of an important Etruscan town, Felsina. The Romans established a colony, Bononia, in 189 B.C.; it was destroyed by fire and rebuilt by Claudius in A.D. 53. Bologna was sacked by Alaric and the Visigoths in 410 and became part of the exarchate of Ravenna, under Byzantine rule. The Lombards sacked the town in 727 or 728 and then held it until the Carolingian conquest in 774. Charlemagne conceded the town to the papacy, though it remained under imperial authority and the jurisdiction of Carolingian counts. Bologna was a frontier town during the Carolingian and Ottonian periods and was reduced to a military center of modest proportions. From the end of the tenth century on, there was intensified traffic on Via Emilia, and Bologna enjoyed modest population growth and new construction, including the transfer of the cathedral of San Pietro from a suburb to the center of town.

The twelfth century saw a sporadic struggle for independence from imperial authority. In 1115, at news of the death of Countess Matilda of

Tuscany, the Bolognese tore down the castle that represented imperial and comital jurisdiction over the town and destroyed the records of their obligations. Henry V (king of Germany and Holy Roman emperor) ratified a *fait accompli* when he issued a diploma dated 16 May 1116 pardoning the Bolognese who had taken part in the revolt, including two jurists who were named as leaders. Henry conceded local autonomy and extended imperial safeguards, with provisions that protected the interests of merchants and landed proprietors, including safe navigation of the Po. In exchange the emperor was promised a substantial sum in annual tribute during imperial visits to Italy. The diploma effectively ratified a new, independent commune.

Significantly, the diploma was witnessed by Irnerius, the scholar of Roman law who first gave the Bolognese *studio* its reputation for legal studies. The *studio* gave Bologna special importance; political leaders were quick to perceive its usefulness. When the emperor Frederick I Barbarossa, at the Council of Roncaglia of 1158, sought to restore imperial authority, he drew on Bolognese jurists to define the imperial *regalia*, or jurisdictional rights. On the basis of the opinions of four learned students of Irnerius, he asserted his right to name civic magistrates and consuls.

In their relations with Barbarossa, the Bolognese fluctuated between cooperation and uprisings against imperial jurisdiction as represented by a *podestà* (podesta, or hired city manager). In 1167 Bologna joined the Lombard League and built an enlarged city wall to defend against any attack by the empire. After the peace of Constance, Bologna's autonomy from the emperor was effectively established. Emperor Henry VI allowed the town the right to mint its own coins; his death in 1197 marked the real end of imperial influence.

Consular Rule and the Rise of the Popular Commune

Bologna established a consular regime like that of many other communes. At first, the consuls were elected by acclamation by the *arengo*, or general assembly, but over time systems of indirect election developed. As elsewhere, this regime enabled an elite urban group to dominate most offices; members of the elite served as not only as town

consuls but also as canons of the cathedral, Bologna, like other Italian towns, attempted to avoid factional domination of executive offices by bringing in outsiders as podestas. In 1200-1203, the commune built a Palazzo del Podestà and demolished houses, churches, and towers to construct a large open piazza that was to become the Piazza Maggiore.

In the course of the thirteenth century the political base of government gradually broadened beyond the narrow consular aristocracy: corporations—including shoemakers, drapers, and tailors as well as merchants and money changers—were represented in the civic councils. Guilds were formed from the mid twelfth century on; they appear in documents of 1144 and 1169, and guild statutes exist from the 1240s. In the early thirteenth century the guilds were joined by societies of arms, voluntary associations for mutual protection. These had an improvised, ad hoc quality. Some were based in neighborhoods and overlapped with parish organizations; others brought together interest groups, including outsiders, like the Society of Lombards or the Society of Tuscans. Some arms societies—such as the butchers—were also guilds. The arms societies protected their members: for instance, if a member was involved in a legal case against a powerful opponent, other members might accompany him to court. Some societies worked

with the civic government to police neighborhoods. Twenty to twenty-four arms societies existed; their size varied from more than 100 to as many as 600 men.

By 1217-1219, the leaders of the guilds and arms societies held seats in the *consiglio*, a town council that until then had been made up of the consular aristocracy, including merchants and bankers. However, an aristocratic reaction set in, and the societies were dissolved in 1219-1220. In 1228, against the background of a conflict between Frederick II and the Second Lombard League, the merchant and landowner Giuseppe Toschi led a popular revolt that culminated in an attack on the town hall and the destruction of the statutes and the court and tax records. The armed societies and guilds then claimed and received a share in governance, which they held for more than a century. Popular political institutions were quickly formed: the most important such institution was the *anziani*, or elders, men elected by the guilds and armed societies who together with the consuls of the money changers and merchants formed the podesta's council.

Bologna played a major role in the Second Lombard League. In response to the military threat from Frederick in 1226-1227, the town built a stronghold called Castelfranco and a third set of walls—initially

a ditch, earth rampart, and palisade. Beginning in the twelfth century the Bolognese commune had worked to subject its *contado*, or rural lands, to civic authority, building fortifications, imposing taxes, and gradually reducing the autonomy of rural communities as well as that of seigneurs, including the bishop. Frederick II supported the bishop against the commune, and when war broke out in 1226 the bishop sided with Frederick against the commune and the Lombard League. After the peace, conflict over the commune's appropriation of episcopal jurisdictional rights continued; this led, in 1232, to a papal excommunication of Bologna, which forced a temporary suspension of the university. At the Battle of Fossalta in 1249 the Bolognese army captured Enzo, Frederick's favorite son; Enzo remained a prisoner until his death in 1272. Pini (1993, 1996, 1997) has argued that the division between Guelfs and Ghibel-lines within the town's nobility derived from debates over Enzo's fate.

The economy of Bologna was relatively weak: the *contaa* was small, and much of it was mountainous and unproductive. Ultimately, Bolognese merchants and bankers were not competitive with the Florentines. The town's major economic function was probably to house, provision, and maintain students. The Bolognese communal government made repeated attempts to strengthen the economy, including active efforts to bring in skilled artisans, particularly textile workers. In 1228-1231, 153 wool and silk masters and their families—500 to 600 people in all—were attracted by favorable contracts financed by the commune. Giuseppe Toschi, the leader of the popular revolt of 1228, sponsored twenty-three families. The civic government also sought to control and enhance resources that could stimulate the economy. One example is the canals, which had been begun in 1183 by private monopolistic groups but by 1217 were controlled by the commune. These provided hydraulic energy for grain mills, served the textile and leather industries, and ensured a water supply for the town's population. Public works included the third circle of city walls and a new cattle market. The Bolognese commune also recognized the advantages of porticoes lining the streets, and so it passed statutes systematizing the existing porticoes and requiring property owners to build new ones. In the thirteenth century, Bologna became a city of porticoes.

The town also created new free communities at sites of economic and strategic importance in the *contado* and made efforts to attract immigrant workers from other regions. A political campaign to free Bologna's serfs in 1256-1257 led to the emancipation of 5,855 people on 3 June 1257; their names and the names of their former lords are recorded in *Liber paradisus*. Lay proprietors were reimbursed eight *lire* for serfs under fourteen years of age and ten *lire* for adults. The preamble to the list speaks of restoring the liberty given by God at creation; but since serfs and men married to serfs were exempt from civic taxes, the emancipation was probably also motivated by a desire to increase tax revenues and preserve a rural workforce.

Studio and University

Legal studies were probably pursued in Bologna from the late eleventh century on. Ambitious rulers and emperors called on Bologna's jurists to provide legal justification for their authority. The most important early figure was Irnerius (died c. 1130), a teacher of the liberal arts who turned to the study of Roman law—notably, to the sixth-century *Digest* of Justinian, which had received little attention. As mentioned above, it was Irnerius who witnessed the imperial diploma giving the Bolognese commune autonomy. A series of scholars of Roman law through the twelfth century culminated in the Florentine Accursius, whose *Glossa ordinaria* (completed c. 1228) became the standard textbook. In the thirteenth and fourteenth centuries scholars called "postglossators" applied principles derived from Roman law to contemporary political problems.

Bologna was also a center of studies of canon law; in this regard its most important product was the *Concordance of Discordant Canons* or *Decretum* (1140) by the monk Gratian. The study of canon law was supported by the popes, particularly after the papacy of Alexander III (mid-twelfth century), who was himself a legal scholar.

Rhetorical studies at Bologna began with Adalberto Samaritani, a contemporary of Irnerius. Influential rhetorical and epistolary manuals were written by Buoncompagno da Signa (fl. c. 1195-1240) and Guido Faba (before 1190-1248). Notarial studies were established at Bologna

by Ranieri da Perugia; Rolandino de' Passeggeri's *Summa artis notariae* (c. 1255) became the standard textbook. The other university faculties were weaker: arts and medicine did not emerge until the second half of the thirteenth century, and the theology faculty was not established until 1364.

The formal university was created in 1190, when law students who were not Bolognese but were living in the city formed an association, or *universitas scholarium*, to aid those who were not protected by the civic or church courts. A complex constitution took shape, including for a time four *universitates*, governed by rectors and counselors elected by the students. The university rapidly took over the supervision of teaching, including hiring masters, paying their salaries, and imposing stiff fines if they failed to meet their obligations. Neither the masters themselves nor the citizens of Bologna had a voice. The *licentia docendi* was introduced by papacy in 1219. The university statutes were approved by the commune and papacy in 1252-1253. In its medieval heyday, the university probably comprised some 2,000 students, despite a tradition that puts the number at 10,000. In the fourteenth century the power of the students dwindled, and by 1350 the commune was appointing the masters. Notaries and jurists had a powerful impact on Bolognese politics; an important example is Rolandino de' Passeggeri, a doctor of notarsal arts who became a popular political leader. A few remaining monumental tombs of glossators, jurists, and notaries, including Rolandino, are striking visual evidence of these scholars' role in the medieval town.

Dominicans and Franciscans, Heresy and Inquisition

The Dominican order arrived in the city as early as 1218 and became an important presence; Dominic himself was buried in Bologna. Francis preached in Bologna in 1222; the Franciscan convent was built on land donated by the commune to the order in 1236. The town was a center of the Alleluia, a religious revival of the 1230s. The Dominican preacher John of Vicenza arrived in Bologna in 1233 and played a dramatic role as mediator and prophet; he was even reputed to raise the dead, and bands of his followers marched in streets. John arbitrated a long-

standing dispute between the town and the bishop over the commune's usurpation of episcopal jurisdictional rights, and he was invited to revise the town's statutes. It was John who first encouraged development of a cult around Dominic's corpse.

For a long time, the Cathars were present in Bologna. The registers include extensive documentation of a major Dominican Inquisition held in 1291-1310, during which 103 men and 37 women were implicated in Catharism. Bolognese Cathars tended to be artisans, particularly in leather and textiles, and many were immigrants to the city. In 1299, when two living men and one dead woman were burned at the stake for heresy, the town rioted in protest. The Inquisition also pursued the Apostolici, a group founded by Gerard Segarelli and led by Fra Dolcino.

Geremei and Lambertazzi, Magnate and *Popolo*

During the 1270s, Bologna was weakened financially and became embroiled in civil wars. Elite factions had developed in mid-century or earlier; they were identified with the Geremei and Lambertazzi families and linked to the international Guelf and Ghibelline parties. The city's political instability was worsened by a disastrous and costly war with Venice in 1272-1273 over control of the regional waterways, used to transport grain. In 1274, there was a ferocious battle between the factions. The Lambertazzi, who had ties to the Ghibellines, were expelled along with their relatives and followers, and their goods were confiscated by the town. This was a massive exile: 4,123 families numbering perhaps 12,000 to 14,000 people were driven from the city. In 1279, under pressure from Pope Nicholas III to reconcile the factions, Bologna readmitted the Lambertazzi; but after forty days of violence it expelled them again. In 1287, severe damage was done to 155 houses of the Lambertazzi. The faction was again admitted in 1299 and its goods, its access to civic office, and its privileges were restored. However, a third expulsion took place in 1306.

At the same time as these factional conflicts, antagonism arose between the *popolani* and the magnates, or nobles. Popular leaders, notably Rolandino de' Passesgeri, feared that the mag nates—a group

they described as rapacious wolves—would dominate the town and oppress the mild sheep, i.e., the guildsmen. Beginning in 1271, the Society of the Popolo imposed a series of ordinances that restricted the magnates' political power. The laws of 1282–1284, the *ordinamenti sacratì e sacratissimi*, established a list of about forty families who were considered magnates and limited their access to civic offices. This legislation also broke with tradition by requiring magnates to post a surety of 1,000 *lire* against their possible commission of crimes against the *popolani*; in addition, such crimes by the magnates were to be severely punished.

Significantly, Bologna never developed the rift between greater and lesser guilds that destabilized politics in Florence. The Bolognese popular regime was, by medieval standards, broad-based. Large numbers of men were admitted to public office: 800 sat in the *consiglio comunale*; 600 to 650 sat in the *consiglio del popolo e della massa*; and the 2,000 members of the *consiglio dei duemila*, who represented quarters, were charged with electing civic officials. The college of *anziani* and *consoli* held the real executive power; it was made up of four consuls from among the merchants and money changers and twenty from the guilds and armed societies.

***Signorie* and the Second Communal Age**

From the late thirteenth century on, Bologna—like other Italian towns—suffered a long decline. It was affected by a series of sieges as well as by famine and by successive waves of plague. The population dropped from some 50,000 in 1294 to 43,000 by 1324 and only 20,000–25,000 after the plague of 1348. The economy shrank. The university also suffered, particularly during a papal interdict of 1339 directed against Bologna and its *signore*, Taddeo Pepoli. The independent commune was put at risk after the emperor, in 1278, confirmed papal rather than imperial authority over the region. The banker Romeo Pepoli took over the town briefly in 1320. His son Taddeo was able to establish a *signoria*, or lordship, over Bologna that lasted from 1337 until 1350, when his sons sold the town to the Visconti of Milan. Bologna came to be ruled by Giovanni Visconti (1355–1360) and Giovanni da Oleggio (1355–1360);

then it fell to the papal reconquest by Cardinal Albornoz and was ruled by papal legates from 1360 to 1376. By the 1370s, the town began to recover; in 1371 the population numbered about 32,000. The Bolognese rose up in revolt and drove out the papal legate to establish a second communal age in 1376-1401. Many of the old forms of civic independence were regained, although the new regime was an oligarchy, with power in the hands of an elite and the representatives of the quarters rather than artisan corporations. The surest sign of this revival is the coining of the pure gold *bolognino* in 1380. During this period Bologna built the Palace of the Notaries and the Mercanzia, and in 1390 the town began the great church on the Piazza Maggiore, dedicated to San Petronio—an offer of thanks for its restored liberty. The Bentivoglio family controlled the town briefly in 1401-1402 and then, in 1435, established a *signoria* that was to last until 1507.

Bolsena

Bolsena is close to the site of an ancient Etruscan town, Velsna, near Orvieto in the region of Latium. Bolsena (in Latin, Volsinii) was founded by refugees from Velsna when the latter came under Roman control in 280 B.C. During the early Middle Ages Bolsena was destroyed and depopulated so severely that its bishopric moved to Orvieto. It was for some time under the control of the Lombards and was then absorbed into the papal states. In 1186, it became a possession of Orvieto; it was taken from Orvieto by Frederick II in 1240 but was returned in 1251. The papal states and Orvieto contested for possession of Bolsena, but in 1296 Pope Boniface VIII established joint ownership with Orvieto. The fourteenth century was characterized by continuing struggles, and in 1377, following a popular uprising, the walls of the town were largely destroyed by Pope Gregory IX.

The nearby Lake of Bolsena was well known for its marine life, and particularly for its fine eels; Pope Martin IV is said to have died of a surfeit of them. According to tradition, a miracle occurred in the grotto in the chapel of Santa Christina in 1263—the famous Miracle of Bolsena. It is said that an apparition of Christ's blood during the eucharist refuted the celebrant's doubts as to the truth of transubstantiation, and the priest's bloodied vestment is kept in an elaborate reliquary in the Chapel of the Corporale in the cathedral of Orvieto. The miracle is

commemorated in the fresco cycle by Ugolino di Prete Ilario, also in the cathedral of Orvieto; and in Raphael's famous fresco in the Stanze of the Vatican palace.

Bonagiunta Orbicciani Degli Averardi

Bonagiunta (c. 1220-before 1300), a poet from Lucca who preceded the *stil novo*, is a character in Dante's *Divine Comedy* (*Purgatorio*, 24). Bonagiunta was a judge and a notary; accordingly, in two authoritative manuscripts (Vatican 3793 and 3214) the poet is given the honorific *ser*, and his name is preserved in deeds drawn up between 1242 and 1257. Fewer than forty of his poems have survived: eleven *canzoni*, two "discords" (*descorts*, or disputes), five ballads, and some twenty sonnets. Three of the sonnets are addressed to other poets: one to Guinizzelli (d. 1276) and two to unidentified correspondents. Another two or three sonnets belong to a *tenzone*—a cycle of verses by several authors—initiated by the judge Gonnella Antelminelli with Bonagiunta and a certain Bonodico, all from Lucca. Bonagiunta's themes include, as might be expected, his changing moods (sorrow, hope, joy, disappointment) as an apprehensive lover, and praise of his lady. In some poems, as is also true of Guittone d'Arezzo (c. 1235-1294) and other Tuscan poets of the time, Bonagiunta touches on or develops moral topics: honor versus pleasure; wisdom and integrity versus foolishness; boasters; corrupt judges; how to deal with fortune; and so on.

To ascertain Bonagiunta's place in poetry, and to give him his due in the development of the Italian lyric, three crucial connections must be explored. How can we relate him to (1) the Sicilian school, (2) Guittone d'Arezzo, and (3) the *stil novo*? An adjunct to the third question is this: Why did Dante, in seeking a narrative catalyst to give himself an opportunity to proclaim and define his *dolce stil nuovo* (*Purgatorio*,

24:57), select Bonagiunta and not, as Contini (1960) wonders, Giacomo da Lentini or Guittone?

With regard to question 1, it is easy to reach agreement. Between the Sicilian school and Bonagiunta there is, in fact, a clear path of transfer and continuity; thus we have no trouble in granting, with Contini, that "apart from the very members of the School, Bonagiunta was the real transplanter of the Sicilian poetry to Tuscany."

However, as regards questions 2 and 3, Contini seems to go too far by loosening the connection between Bonagiunta and Guittone in an attempt to establish, instead, a more direct link between Bonagiunta and the poets of the *stil novo*; according to Contini, beneath the cumbersome superstructure of Guittone's *trobar clus* (hermetic style), Bonagiunta elaborated the Sicilian tradition and channeled it toward the results finally achieved by the Florentine *stil novo*. Marti (1973) has toned down this interpretation. *Bonagiuntismo* may have been the state of affairs to which Guittone was reacting in developing his own innovative, pithy writing; but Bonagiunta was no doubt attracted by the younger, more authoritative, and more charismatic Guittone. Although Bonagiunta's own tendency was comparatively archaic and *leu* (free, open), he considered himself a staunch supporter of Guittone. This is revealed in the sonnet directed to Guinizzelli (*Vol, ch'avete mutata la mainera*, "You who have changed the manner"), where he harshly chides Guinizzelli for changing the style then gloriously in force: that is, Guittone's. In addition, Dante perceived—and condemned—Bonagiunta as a Guittonian, in *De vulgari eloquentia* (1.xiii.1) and also in a famous episode in *Purgatory*, 24 (although, we should note, *lato sensu*, i.e., without the benefit of a detailed stylistic analysis).

An even thornier question is whether Bonagiunta might be considered a forerunner or incubator of the *stil novo* (a problem which also arises, for instance, in trying to place Chiaro Davanzati). This question is especially difficult because we do not know when Bonagiunta died or, more important, when he stopped writing. He probably outlived Guinizzelli, but we have no idea how long he remained active as a poet in the last twenty years of the century. However, it is not very likely, given his advanced age, that the features of the *stil novo* which some readers discern in his verses were due to any influence exerted on him by the new school (especially Cavalcanti),

as Francesco Novati was inclined to believe. Considering the continuity and the constraints of the lyrical tradition, one should be cautious in retrospectively applying the term *stil novo*, or even "stilnovistic," to lexical and metric combinations in the work of earlier poets. In such cases the real significance is to be found in the context, both literal and cultural.

For the episode in *Purgatory* 24, then, Dante would have thought of Bonagiunta for several reasons. For one thing, only through Bonagiunta could the lyrical reminiscence of Gentucca be introduced; for another, Dante certainly held Bonagiunta responsible for having blindly exalted Guittone's reputation (*Purgatory*, 26.124-126) over that of Guinizelli, whom Dante considered his own poetic father. Bonagiunta had resented and objected to the novelty of Guinizelli's "sweet style"; let him now joyfully acknowledge, in the unescapable dialectics of *contrappasso*, the messianic renewal that Dante was bringing about.

Bonaiuto of Casentino

The Latin poet Bonaiuto of Casentino (died c. 1312) was originally from Borgo alia Collina, near Poppi in the province of Arezzo. He arrived in Rome during the winter of 1291-1292, and over the next nine years—a period that largely overlaps with the papacy of Boniface VIII—he pursued a successful career as a writer and chaplain at the papal court.

During this time, Bonaiuto produced, in addition to his routine documentary work, a number of occasional poems and other brief texts, not all of which have survived. His *Diversiloquium* (*Varied Discourse*) is a miscellany containing fourteen poems ranging in length from six to 155 lines and an unfinished prose treatise in epistolary form on virtues and vices. These were collected by Bonaiuto's scribe, G. of Romandiola (i.e., the Ro magna), and in most instances the occasion for each work is noted in the prose prefaces that the compiler provided. The datable pieces belong to the period 1292-1297. Several of the pieces celebrate aspects of Boniface's reign or commemorate members of his family, and it evidently because of this aspect of the work that *Diversiloquium* was preserved: the only known copy was already the property of the papacy in 1311. Two religious lyrics in *Diversiloquium* are addressed to Boniface's personal physician and are accompanied, in the manuscript, by musical notation; at least one of these, the sequence *Hec medela corporalis*, has entered the modern performance repertoire of medieval Italian music. Bonaiuto's other surviving literary work, transmitted separately, is a 52-line poem on the first papal jubilee (that of 1300); like *Diversiloquium*, it honors Boniface by name.

In 1301, Boniface appointed Bonaiuto (who was by then a canon of Le Mans and of Aquileia) a papal tax collector for parts of Germany, parts of Austria, the kingdoms of Hungary and Bohemia, the duchy of

Poland, and the marquisate of Moravia. Bonaiuto occupied this position until at least 1309. Bonaiuto's death is assumed to have occurred shortly before 29 April 1312, when Pope Clement V assigned to others property in the vicinity of Bologna that Bonaiuto had willed to the church.

Bonaiuto's poems, most of which have only recently been edited, shed light on certain aspects of curial life and document historical events, and their literary quality is far from negligible. Written in several different styles and forms, including classicizing hexameter verse, leonine hexameters, and accentual lyrics, they reveal the learning, skill, and versatility of their author and bear witness to the artistic culture valued at Boniface's court.

Bonatti, Guido

Guido Bonatti (c. 1210-c. 1297), the foremost astrologer of his century, was born in the Romagna at Forlì. He practiced medicine as well as astrology, both of which he probably learned at nearby Bologna. He spent most of his life in Forlì, where he owned land, but from time to time he left to advise various Ghibelline leaders. In 1248, he warned Frederick II by letter of a plot against him, but Bonatti does not seem to have been Frederick's regular astrologer. He was at the court of Ezzelino da Romano in 1259, attended Guido Novello in 1260-1261, and counseled Guido da Montefeltro during Montefeltro's years at Forlì (1275-1283). There are many anecdotes about Guido Bonatti's legendary astuteness and astrological expertise, but today he is best remembered for his *Liber astronomicus* (after 1277), the most successful Latin textbook of astrology of the period. In *Inferno* (20.118), Dante placed Bonatti among the diviners in hell.

Bonaventura Berlinghieri

Bonaventura Berlinghieri (fl. 1235-1244) painted a gabled altarpiece at Pescia depicting Saint Francis flanked by six scenes of Francis's life and miracles. This work, unusual because it is both signed and dated (1235), is a linchpin in the chronology of Italian painting: it clarifies developments in style as well as in Franciscan iconography; and current analyses have been aided by its restoration in 1982.

The format and style of this work suggest that Bonaventura was the most innovative of the three sons of the Lucchese painter Berlinghiero di Milanese. Documents place the activity of Berlinghiero and his sons—Bonaventura, Barone, and Marco—between 1228 and 1282, primarily at Lucca; a relatively recent attempt by Caleca (1981) to associate the Berlinghieri of Lucca with Volterra has not changed that localization. Although Marco was commissioned to illuminate manuscripts and both Marco and Bonaventura received commissions for frescoes, most of the extant works associated with the Berlinghieri are images of the Virgin and Child and the Passion painted on wooden panels. These works are in a distinctive style, in which the linear Italian Romanesque tradition is transformed by a new and intense familiarity with Byzantine images produced shortly before 1200. On the basis of the resulting angular, expressive facial types and the architectural and landscape settings, a large number of works have been associated with the Berlinghieri family. Several of these have been attributed to Bonaventura Berlinghieri and his followers, including a diptych originally from Lucca but now in the Uffizi in Florence, portions of a Crucifixion in

Tereglio, and a group of works sometimes attributed to a separate "Oblate Cross Master." Together, these Lucchese painters had a profound impact on the style of painters in other Tuscan centers, especially Florence, such as the Bardi Saint Francis Master, the Bigallo Master, the Master of the Uffizi Crucifix 434, and Coppo di Marcovaldo.

Bonaventure, Saint

Saint Bonaventure (or Bonaventura; Giovanni Fidanza, c. 1217-1274) entered the Franciscan order in 1243 and studied in Paris, first in the faculty of arts and then with the theologian Alexander of Hales. While he was in Paris, he prepared a commentary on the *Four Books of Sentences* of Peter Lombard. Bonaventure taught at Paris from 1248 on, successfully if somewhat controversially, until he was elected minister-general of the order in 1257. At some unrecorded point he had acquired the nickname Bonaventure or Bonaventura ("good fortune")—the name by which he is now known.

As leader of the Franciscans, Bonaventure tried to steer a middle course between the growing moral laxity of the order's Official wing and the increasing extremism and anti intellectualism of its fundamentalist Spiritual wing. The *Constitutions of Narbonne*, drawn up under his direction in 1260, were a first step toward healing the breach within the order, although the task was eventually to prove beyond the strength of either Bonaventure himself or his successors. His commentary on the Franciscan rule and his writings about Francis, based on his collection of reminiscences of the saint in the area around Assisi in 1261, are important documents recording his own moderate position. His life of Francis, *Legenda maior* and *Legenda minor*, was accepted by the order as the official biography in 1263; and three years later a general council of the order declared—to the fury of the Spiritual Franciscans—that all other biographies of Francis then in circulation should be destroyed.

Bonaventure's gifts as a conciliator were crucial in ending the lengthy vacancy in the papacy that arose after Clement IV's death in 1268; the election of Gregory X in 1271 was due largely to his influence,

Bonaventure died shortly after making a vital contribution to the attempt at the Council of Lyons to settle the schism between eastern and western Christianity.

Bonaventure's voluminous writings—commentaries, philosophy, theology, history, biography, devotional treatises, and sermons—were widely available and highly influential in the late Middle Ages. As a theologian he adhered substantially to a tradition inherited, through Saint Anselm, from Saint Augustine. Bonaventure was much less receptive than his contemporary and fellow Dominican Thomas Aquinas to the ideas and methodology associated with scholastic Aristotelianism, although the two taught simultaneously in Paris in 1256-1257. In their differing positions and approaches Bonaventure and Aquinas largely incarnated the profound differences between their two orders. Bonaventure's thought as a whole is marked—in a way that contrasts clearly with the essentially rational and philosophical tenets of Aquinas's thinking—by his belief in the value of mysticism as a form of knowledge, and of mystical experience as a means of knowing God. This is the doctrine encapsulated in what is perhaps his most popular and influential work, *Itinerarium mentis in Deum* (*The Mind's Journey into God*), a title in which the choice of the preposition—in ("into") rather than simply *ad* ("to")—is highly significant. *Itinerarium* has sometimes been posited as an influence on Dante's *Comedy*, because Bonaventure recounts a mystical ascent toward visionary experience comparable to that described in Dante's work; but the connection, though not unlikely, has not been conclusively demonstrated,

Saint Bonaventure. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 214r.

However, it is in the *Comedy* that Bonaventure makes his most celebrated appearance in Italian literature, as one of the principal characters in the narrative of *Paradiso* (12.28-145). There, Bonaventure plays the role he occupied in history: spokesman for a moderate and spiritually pristine form of Franciscanism guaranteed by the authority of the order's founder. In an episode that parallels Thomas Aquinas's eulogy of Francis in Canto 10, Dante's Bonaventure first (verses 31–105) speaks at length in praise of Saint Dominic, founder of the Franciscans' great rival institution, and then (verses 112-126) bitterly condemns the failings of his own order in the early fourteenth century, summed up in the Official Franciscans' dwindling devotion to Francis's rule and the Spiritual Franciscans' excessively rigorous application of it. Finally (verses 127-145) he announces his own identity and goes on to list the other souls who appear alongside him: other early Franciscans (verses 130–132) as well as an assortment of Jewish and Christian thinkers—including, paradoxically and perhaps polemically, Joachim of Fiore, the intellectual patron of the Spirituals whom the historical Bonaventure (unlike Dante) disparaged.

Bondie Dietaiuti

Little is known about the thirteenth-century Florentine poet Bondie Dietaiuti, although some conjectures have been made from his surviving works—four *canzoni* and three sonnets—in MS Vaticano Latino 3793. Bondie's compositions are marked by imitations of courtly Sicilian motifs (e.g., the phoenix and salamander found in bestiaries) and themes (love from afar, the physiology of love). Particularly important is Bondie's *canzone d'amtco* (*Amor, quando mi membra*) in response to Brunetto Latini's only extant *canzonetta* (*S'eo sono distretto inamoratamente*), which immediately precedes it in the Vatican manuscript. Avalle (1977) suggests that Bondie's correspondence poetry with Brunetto and Rustico Filippi (two of the seven works) constitutes

homoerotic texts, amounting to subtly coded personal communications between friends.

Boniface, Marquis of Tuscany

Boniface (c. 985-1052) was born in Mantua, the son of Tebaldo of Canossa and the countess Julia. He was a feudal lord, loyal to the German emperors Henry II and Conrad II. His north Lombard duchy included Mantua, Modena, Reggio, Parma, and Ferrara (and perhaps also Cremona, Brescia, and Piacenza); in 1027, the March of Tuscany was added to it by a decree of Conrad II.

Boniface was a strong proponent of the incorporation of the church within feudal structures. One of his allies in pro-imperial causes was Aribert, archbishop of Milan; but Boniface also followed Aribert's anti-imperial sentiments. Boniface accompanied Henry III to his coronation in Rome but refused to support Henry's intervention in papal disputes there. Boniface's first marriage was to Countess Rachilda, daughter of Guilberto degli Obertenghi. His second marriage was to Countess Beatrice, daughter of Duke Frederick of Lower Lotharingia (Bassa Lorena); he and Beatrice had three children, the most celebrated of whom was Matilda of Tuscany. Boniface was killed in San Martino dell'Argine; his death may have been ordered by Emperor Henry III as a consequence of Boniface's power and political autonomy vis-à-vis the emperor.

Boniface VIII, Pope

Pope Boniface VIII (Benedetto Caetani, sometimes Gaetani; c. 1235 or 1240-1303, r. 1294-1303) was born in Anagni, a hill town southeast of Rome that was his family's ancestral home. He is remembered as the last great monarch-pope, an ambitious amasser of power and wealth. He asserted the supremacy of papal authority in the power struggles attending the advent of the European nation-states—struggles in which he was an able player. However, he was defeated in his clash with the French king Philip IV (the Fair) and was tried posthumously. Often, it is from the record of these posthumous proceedings that historians and Boniface's biographers have gleaned details of his personal character; thus it is difficult to know how seriously to take the charge that Boniface was a heretic who openly denied the immortality of the soul and the sanctity of the eucharist. He did surely use his office to increase the wealth of the church and did openly declare that it was a logical impossibility for the pope to be guilty of simony. Dante, for one, begged to differ and proclaimed Boniface's imminent arrival among the simoniacs in *Inferno* 19.

The young Benedetto (Benedict) Caetani began his legal education and his ecclesiastical career at Todi and Spoleto in the 1260s; he gained valuable diplomatic experience as a papal legate in France and England. He was made a cardinal by Pope Martin IV in 1281. The following year,

the uprising known as the Sicilian Vespers transferred control of Sicily from Charles I of Anjou, king of Naples (a papal fief), to Pedro III of Aragon. The struggle between Anjou and Aragon for the control of Sicily was to plague Boniface's entire tenure as pope.

The precise circumstances that led to Cardinal Benedict's accession to the papacy as Boniface VIII remain somewhat mysterious. After the death of Nicholas IV in 1292, the Colonna and Orsini factions in the College of Cardinals could not come to terms, and the conclave, removed to Perugia from malarial Rome, dragged on into the hot summer months of 1294. Benedict, who was now in his sixties and was intermittently unwell, with gout and kidney stones, rested in Viterbo and Sismano. He spent time in the company of a certain Parisian doctor with whom he discussed, rather casually, questions of faith and sexual morality. One witness reported having overheard Benedict say, "Sleeping with women or boys is no more a sin than rubbing your hands together." Meanwhile, the weary conclave finally agreed on an unlikely outsider, Pietro Morrone, a devout eremite of the Abruzzi who was an exponent of the fanatical asceticism that had been sweeping central Italy for a century. Pietro became Pope Celestine V and spent his entire five-month papacy in Naples under the watch of Charles of Anjou, frustrating the Franciscan Spirituals who hoped to make Celestine their long-awaited reformer, and overwhelmed by political demands he could not fathom. Celestine wanted to escape, and although it was unclear whether a pope could legally abdicate, Benedict assured him that abdication was both legal and appropriate. (One of the more wild-eyed chronicles has Benedict haunting Celestine at night, casting his voice into Celestine's cell through a tube and urging him to resign.) Celestine resigned on 13 December, and Benedict became Boniface VIII on the day before Christmas.

Boniface acted at once to reimpose papal authority by invalidating Celestine's appointments, which in any case had been rather arbitrary. During the first few years of his papacy, he intervened deftly in European affairs. By 1296, however, his tense relations with Philip the Fair and with Edward I of England had reached a crisis over the issue of taxation: did secular monarchs have the authority to tax the clergy? In the bull *Clericis laicos*, Boniface soundly forbade taxation of the clergy without the pope's approval. Philip responded by expelling Italian

trading agents from France and outlawing the export of gold bullion. The scene was set for their final conflict.

In 1297, however, there was a commotion closer to home. The Colonna, who were alarmed by the loss of their lands to the Caetani and Orsini under Boniface, at last openly challenged the legitimacy of his election. Boniface declared war, indeed a holy war, against the Colonna and their property, and by late 1298 he had the Colonna at his mercy: they had taken refuge in their mountaintop fortress at Palestrina. These events inform Dante's encounter in *Inferno* 27 with Guido da Montefeltro, a soldier turned Franciscan, an encounter in which the apparently penitent friar provides treacherous advice. In the end, Palestrina was razed, and the Colonna fled to France to bide their time.

Also in 1298, Boniface published an important compilation of canon law. In 1300, he declared the first jubilee. In 1301, he invited Philip's landless brother Charles of Valois to Italy, ostensibly to help him restore peace in Sicily—and in upstart Florence, where dangerous experiments in republican democracy had been under way since the early 1290s and the aristocratic Black Guelphs had been banished from power. By November 1301, Charles had entered Florence, reinstalled the Black Guelphs, and taken what he could for himself; but no peace came of his efforts. The Black Guelphs immediately exiled the leading Whites, including Dante, whose disdain for Boniface as an emblem of ecclesiastical corruption marks the entire *Comedy*.

In the meantime, the tension with Philip had led to open conflict and defiance on both sides. In 1301, Boniface issued the letter *Ausculda fili* (*Listen Here, Son*), an unbridled indictment of Philip; and in November 1302 he issued the famous bull *Unam sanctum*. According to *Unarn sanctam*, it is true that the world is ruled by two swords, temporal and spiritual, but the spiritual must forever guide and judge the temporal; and this must be taken on faith as divine revelation. In April 1303, Boniface recognized Albert of Hapsburg as Holy Roman emperor while reaffirming the absolute supremacy of the papacy in the bull *Patris aeterni*, in which the earlier military metaphors are replaced by astronomy; pope and emperor are, respectively, like the sun and moon, a greater source and a lesser, reflected light. Dante would redefine this traditional imagery in Book 3 of *Monarchist*, where both lights are

declared to be equally dependent on God. In the same month that he issued *Patris aeterni*, Boniface founded the University of Rome.

Through the spring and summer of 1303, Philip the Fair held council with his ministers and the alienated Colonna and drew up formal charges against Boniface, denying the legitimacy of Boniface's rule and demanding that he stand trial. Boniface moved to excommunicate Philip. A contingent of men led by Sciarra Colonna and Philip's minister Guillaume de Nogaret laid siege to Boniface at Anagni and seized the pope during the first week of September. Boniface managed to escape after three days, but he was utterly undone by the episode. He died in Rome on 12 October.

Bonifacio Calvo

The thirteenth-century troubadour Bonifacio Calvo was Genoese but spent the greater part of his life in Spain, at the court of King Alfonso X the Wise. There, Bonifacio mainly wrote *sirventes* (poems of blame) in the style of Bertran de Born. For instance, he tried to incite Alfonso to war on Henry III of England, who was occupying the Gascogne

(Gascony); these particular *sirventes* can thus be dated 1253-1254. A particularly fine piece of work by Bonifacio is a *planh* (lament) on the death of his lady. Bonifacio's stay in Spain was also long enough to enable him to compose two *cantigas de amor* in Gallego-Portuguese; in his love poetry, he imitated Arnaut Daniel.

In 1266, Bonifacio returned to Genoa, where he wrote works in Occitan, including two *descorts* (disputes) with the Genoese poets Scot and Luquet Gattulus. Equally well known is Bonifacio's *sirventes* against the Venetians, which was answered by the merchant troubadour Bartolomeo Zorzi, then (1266-1273) a prisoner of the Genoese. In total, nineteen of Bonifacio's poems and two of his *descorts* are preserved.

Bono Giamboni

The thirteenth-century Florentine Bono Giamboni was famous in his own time as a translator of Latin works; he was also the author of noteworthy original prose works and indeed can be considered one of the fathers of Italian prose. His dates are unknown, but since he was a judge as early as 1261, he may have been born around 1235; the last document to contain his name is from 1292.

Two remarkable *volgarizzamenti* from Latin (translations into the vernacular) bear his name: Orosius's *Historiae adversus paganos* (*Histories Opposing Pagans*) and Vegetius's *Epitoma rei militaris* (*Summary of Military Matters*). They are evidence that at this time in the Middle Ages, although there was not yet any full awareness of different periods of latinity, there was an incipient interest in Rome and the classical world. In translating these works, Bono clearly intended to do justice to their content more than to the letter of the text. The attention to detail, the rhythm and syntactic structure, and the formal elegance of the Italian are uncommon for the period, as is the generally even tone. Bono also translated the austere *De miseria humane conditionis* of Lotario Diacono (Pope Innocent III), as *Delia miseria dell'uomo*. Here Bono reworks his source to suit his own pleasure; he includes the much lighter work of Albertano (Albertanus) da Brescia to create a small book of moral persuasion unusual for its originality and verve.

Bono also used a Boethian pseudo-autobiographical scheme for his major original work, *Libra de' vizi e delle virtudi* (*Book of Vices and Virtues*), in which Philosophy takes the narrator to the palace of Faith and to a battlefield of vices and virtues. This work shows Bono's familiarity with Latin authors, his thoughtful use of sources, and his quest for a noble Italian prose style that could simultaneously teach and

narrate. Its early date makes it a valuable example of contemporary prose, and its content is comparable to that of Brunetto Latini's encyclopedic *Trésor* and even to Dante's *Paradiso*.

During the Middle Ages, dozens of other works were attributed to Bono, perhaps because of the popularity of his own writings or perhaps for reasons that are now unclear to us. Among these attributions is a translation of Brunetto Latini's *Trésor* from Picardian French into Italian, although we cannot document with certainty that Bono could even read French, much less translate it. A recent theory is that Bono was the first translator of the pseudo-Ciceronian *Rhetorica ad Herennium*, and that the otherwise unknown Guidotto da Bologna reworked Bono's translation to produce *Fiore di rettorica*. Still other works may eventually be ascribed to Bono, who is certainly an interesting figure, but we need to approach such attributions with caution.

Bonvesin Da La Riva

Bonvesin da la Riva (c. 1240 or 1245-1313, 1314 or 1315) was the most important figure in thirteenth-century Lombard literature, and his work is so vast and various that he should appear as well in the cultural map

of medieval Europe as a whole. He was probably born in Milan; he spent the first part of his adult life in the nearby town of Legnano, but by 1288 he had returned to Milan, where he later died. Bonvesin was sincerely religious and was deeply involved in charitable organizations (he belonged to the third order of the Humiliati), but he remained a layman and married twice, though he remained childless. He kept private schools in Legnano and Milan, where he taught Latin (*grammatica*) and possibly other fundamentals to the sons of well-to-do bourgeois. He himself was also a member of the industrious middle class—the people who formed the backbone of the commune. (The Humiliati had interests in the profitable manufacture of textiles and in general were known for their economic activities no less than for their works of charity.) Bonvesin lived through a period of social and political upheaval during which the glorious old commune of Milan was undermined and the signory of the Visconti family was established. As a man of law and order, Bonvesin did his best to adjust to these dramatic changes.

Bonvesin's surviving writings consist of nineteen vernacular poems ranging in length from fifty-two to 1,048 lines. They bear Latin titles (either original or analogically reconstructed), and scholars have conventionally designated them by capital letters. In the following list, vv. indicates number of verses.

A: *De Sathana cum Virgine*, vv. 480

B: *Vulgare de elymosinis*, vv. 1048

C: *De quindecim miraculis que debent apparere ante diem iudicii*, vv. 52

D: *De die iudicii*, vv. 396

E-F: *De anima cum corpore*, vv. 532 (this work was at one time mistaken for two independent poems)

G: *Disputatio rose cum viola*, vv. 248

H: *Disputatio musce cum formica*, vv. 276

I: *De peccatore cum Virgine*, vv. 144

L: *Laudes de Virgine Maria*, vv. 528

M: *Rationes quare Virgo tenetur diligere peccatores*, vv. 124

N: *De quinquaginta curialitatibus ad mensam*, vv. 204

O: *Vulgare de passione sancti Job*, vv. 324

P: *Vita beati Alexii*, vv. 524
Q: *De falsis excusationibus*, vv. 276
R: *De vanitatibus*, vv. 128
S (1): *De scriptura nigra*, vv. 908
S (2): *De scriptura rubra*, vv. 448
S (3): *De scriptura aurea*, vv. 752
T: *Disputatio mensium*, vv. 736

To these must be added the following. (The letters U and W are not used.)

V: a translation of the famous *Disticha Catonis*, vv. 600
X (1–3): three fragments of a *De cruce*, vv. 70, 58, 60, discovered in 1979

However, the two manuscripts of V contain a text too corrupted to allow a recovery of the original reading.

The meter to which Bonvesin adheres faithfully is the quatrain of caesured alexandrines; in fact, his verses are more regular and more "literary" than, e.g., those of Giacomino da Verona, showing no tendency toward the decasyllable of the jongleurs. Only in N and in V do the lines rhyme in pairs (aabb); in all the other poems the stanzas are monorhymed (aaaa, bbbb, and so on).

There are eight manuscripts (dating from the fourteenth and fifteenth centuries), traditionally identified with Greek (lowercase) letters. Only manuscripts Alpha (α), Beta (β), and Gamma (γ) contain more than a single poem each, as follows.

Alpha (α): A to the first part of P
Beta (β): D, E-F, I, L, M, O, Q, R, S (1), S (2), S (3)
Gamma (γ): D, N, S (2)

Manuscript Alpha (α) is at the Preussische Staatsbibliothek in Berlin; manuscripts Beta (β) and Gamma (γ) are at the Ambrosian Library in Milan.

N was published (from Gamma, or γ) by B. Biondelli as early as 1847 and was subsequently (1869) reprinted and translated into English by W. M. Rossetti. Meanwhile (1850-1851), I. Bekker had caused something

of a stir among specialists by publishing in the *Berichte* of the Prussian Academy all the poems preserved in Alpha (α). There were subsequent partial editions—such as T (E. Lidforss 1872) and the controversial group Q-S (V. De Bartholomaeis 1901; L. Biàdene 1902)—until the 1930s. At that time G. Contini devoted himself to the task; and in 1941 he was able to offer, under the aegis of Società Filologica Romana, a masterly annotated critical edition of Bonvesin's vernacular poems. This edition was complete except for the three fragments of X and the second manuscript of V, which had not yet been discovered. Contini's edition is either based or modeled on manuscript α , from the early fourteenth century, which records Bonvesin's Old Milanese dialect most faithfully.

Thematically, the poems can be grouped in five categories, which will be discussed in turn:

1. Hagiography (B, L, M, O, P)
2. Religious didacticism (C, D, Q, R, S, X)
3. Secular didactic works (N, V)
4. Religious debates (A, E-F, I)
5. Moral-political debates (G, H, T)

Category 1. As a hagiographer, Bonvesin can be a remarkable narrator. He presents, in the moving tones of a participant, the wrenching sufferings of Saint Job and Saint Alexis; and he introduces numerous *exempla*, full of pathos and suspense, to illustrate the benevolent power of the Virgin Mary and the generosity of almsgivers (whose pity is always lavishly rewarded).

Category 2. In the category of religious didacticism, the central position is held by the "Book of the Three Scriptures," a triptych describing hell, Christ's passion, and paradise (respectively the "Black," "Red," and "Golden" scriptures). Hell and paradise—the two eternal destinations to which humans will be assigned by divine justice—depend on Christ's sacrifice, because Christians will be saved by treasuring the redemption or lost by forfeiting it. Bonvesin divides hell into twelve punishments and paradise into twelve blessings or glories, in order to convey that there are both correspondences and a sharp opposition between the two realms. Thus the stench, the company of devils, and the bloodcurdling screams of hell in S (1) correspond to a

heavenly fragrance, the society of angels, and sweet singing in S (2). Although Bonvesin uses his own descriptive pattern, all the typical ingredients of the genre are present: *exempla ficta*, the cruelties of the devils, the pathetic (and edifying) complaints of the damned, and so on. For paradise, he retains the metaphor of the Heavenly City, whose glory is matched only by the superlative fire of punishment. The rendering of this material, predictably, is flatter and more repetitious. In the section on the passion of Christ, which ends with some stanzas expressing intense pity, the suffering of Christ's mother is also emphasized.

Category 3. In the category of secular didacticism, "the fifty courtesies that must be observed at the table" (N, 1.3) are listed, sententiously but affably. They can surely be seen in the context of medieval courtesy books, and they are a delightful introduction to a late Gothic banquet hall and to the social life of the communal bourgeoisie.

Category 4. As regards the category of religious debates, there is no doubt that Bonvesin was a master of the debate—a rhetorical form which could be applied to love poetry and to didactic and religious genres. In E-F, in a series of speeches and debates, he elaborates on the well-known dispute between body and soul: the creator warns the soul; a "chapter" of members accuses the heart; and souls, both blessed and damned, address their former bodies, first when the bodies are still entombed and again at the resurrection. In I, the entreaties and the arguments of a repentant sinner succeed in mollifying a disapproving Virgin; in A, the crafty, insinuating Satan—one of Bonvesin's best characters—tries to dissuade Mary from intervening on behalf of souls, since her interference makes his job too difficult.

Category 5. In the category of moral-political debates, the term "moral-political" suggests the two different levels of meaning that can be constructed from a literal datum, the fable. These debates reveal Bonvesin's concerns as a citizen. The charming and useful Violet asserts its merits in the face of the arrogance and opulence of the Rose, and at the end, the judge—the Lily—proclaims that there is no winner. Here, allegorically, the communal class confronts the dissatisfied and threatening magnates of the city (G). In H, the hardworking Ant, who is another version of the Violet, vigorously attacks and puts to flight the profligate Fly, who represents a parasitic and anarchic "left" tainted

with heresy. In T, which can be seen as an amplified apologue that makes use of disputation, Bonvesin acknowledges as necessary the charismatic authority of King January over the unruly Months—thus indicating his acceptance of the Visconti's seignory, which he must have considered the only viable alternative to civic discord.

The bulk of Bonvesin's vernacular works can probably be placed in the 1270s and early 1280s, when he was still living and teaching in Legnano. His three Latin works are usually placed in subsequent decades; however, the prose of *De magnalibus Mediolani*—a fascinating panegyric to Milan discovered and published by Francesco Novati in 1894—may be dated with certainty to the year 1288. *Carmina de mensibus* (*Song of the Months*, in 430 hexameters, published by Leandro Biadene in 1901), is Bonvesin's own translation of T from the Italian. Some scholars hold that the Latin text of *Carmina de mensibus* might have been the original version of the poem, but this idea does not seem very credible. *Vita scholastica*, a long poem in elegiac couplets (w. 936), is a handbook meant for students but also useful to teachers; here the old *grammaticus* applies his rich personal experience. *Vita scholastica* was transmitted by more than thirty codices (fourteenth-fifteenth centuries) and twentytwo printed editions (fifteenth-sixteenth centuries) and apparently was a success from the beginning.

The medieval poets of Lombardy were on the whole confined to the limbo of the archives, where they were seldom visited; not until the mid-nineteenth century did linguists and historians start looking for them. There were at least two reasons for this neglect: first, the literary Florentine dialect spread to northern Italy beginning in the late fourteenth century; second, the literary and academic tradition was firmly centered on Florentine. (Later, Boiardo tried to write his heroic poem in Florentine; and Poliziano, in *Favola d'Orfeo*, had already used the northern vernacular, by then a dialect, to achieve a sense of "otherness.") Today, the Lombard poets—unquestionably headed by Bonvesin—have been retrieved from oblivion by perceptive philologists and may finally be taken into account by critics who are unhindered by linguistic or aesthetic prejudice and are seeking an organic reconstruction of the literary civilization of Italy.

Bookkeeping, Double-Entry

During the Middle Ages, Italian bookkeeping led all of Europe in technical achievements. Although we may assume that merchants had kept account books in earlier times, the oldest remaining fragment of such a book dates from 1211: in it, the debtors' and creditors' accounts of a Bolognese client of a Florentine bank are written out in *volgare*, i.e., the vernacular. During the second half of the thirteenth century, we find an increase in the number of surviving records; and c. 1300 we find not only parts of account books but also complete books: those of the Fini, Farolfi, Peruzzi, Bardi, and Del Bene. Starting in the 1360s, we have the account books of Francesco Datini of Prato, which include many auxiliary and subsidiary books (until 1410, a total of almost 600 books). Without these resources, any analysis of the accounting systems would have to be based on presumptions.

Most of the account books that survive from before 1350 were written by Tuscan merchants. The first extant book of this period is from Milan in the second half of the fourteenth century (bank of del Maino, Marco Serrainerio company). These books are written in Latin, but with regard to bookkeeping and accounting they are structurally almost identical to Tuscan account books written in the vernacular. Not

until the fifteenth century do we find evidence of account books from other regions of Italy (for example, an account book of 1436–1439 of the Venetian Giacomo Badoer).

The entries of the accounts consisted mostly of one or several full sentences, skillfully set forth on a page divided into three columns. An entry started with the name of the debtor or creditor: the first letter of his name was placed in the left column. After the phrase *dee dare* (shall give) or *dee avere* (shall have), a statement of disposition followed the reason for the entry, with a short description of the business transaction, which often included an exact description of the trade goods. In older account books this was completed with the names of witnesses or guarantors who were present during the business transactions. Here the sentence was made up in such a way that the quantity of the traded goods—as well as the first letter of the client's name—could be written in the left column. At the end of the sentence or entry, the amount was noted so that it could easily be placed in the right column.

Italian merchants used Arabic numerals in calculations as early as the thirteenth century; but in their account books Roman numerals predominated—though with decreasing frequency—until the late fifteenth century. The page numbering and dates were increasingly written in Arabic numerals, as were notes, often appearing as intermediate totals or subtotals. However, the number of traded goods (placed in the left column) and the noted amount (in the right column) were written only in Roman numerals. This prolonged use of the "old" writing style was mostly due to a widespread belief that Roman numerals were forgery-proof.

For a long time, especially in notebooks, debits and credits were placed not side by side but rather one on top of the other (this was called a *sezione sovraaposto* entry). If a debt had been paid, it was written below the debit entry or entries. The entry was written as a whole sentence similar to the format described above; but instead of *dee dare* and *dee avere*, it used the words *ha dato* (has given), *ha avuto* (has gotten), or *abbiamo dato* (we have given). During the fourteenth century, account books were divided, on the whole, into one debit part in the front and one credit part at the back. The direct line-up of debit and credit was not established in Tuscany until nearly the end of the

century, although it may have been practiced somewhat earlier in Venice. At first, both the left page and the right page of two open sheets in the accountant's ledger were used (this format was called *alla veneziana*); later, a single page was divided into two parts by a vertical line.

Merchants kept different books for various areas of their businesses. Thus a *libro di entrata e uscita* (book of income and expenditures) served as a cashbook, whereas large quantities of goods traded over long distances were noted in a *libro di balle mandate* (book of bales dispatched). The income and profits of the *socii* (members or partners) as well as agreements made by the management, including elaborate business contracts, were recorded in a *libro secreto* (secret book). The ledger, in which debtors and creditors were recorded, was called the *libro grande* (by Datini), *mastro*, *campione*, *libro dell'asse*, *libro dei debitori e creditori* (by the Medici), or *libro reale* (in Arezzo). Because a great amount of information had to be recorded, several successive account books of the same type were required. In the beginning, such successive books were differentiated only by terms such as *libro nuovo* for the most recent book and *libro vecchio* for a book already completed. Quite soon, however, a system of identifying account books with single letters, colored bindings, or both was established. For example, one of Datini's ledgers is called *libro grande o giallo, segnato A* (large or yellow book, marked A).

In addition to classifying books by type of business or chronological order, merchants took into consideration whether the books contained original entries, which were then indicated as the first note for a transaction, or whether the lots were based on entries previously written in other account books. As shown in Datini's early account books from the 1360s and 1370s, rough chronological drafts—called *ricordanze*—were used even before the introduction of double-entry accounting. The entries for debtors and creditors in the *ricordanze* were then copied into a *memoriale*, a book which had been divided into a front section for debits and a back section for credits. Here, various entries for a particular person could be summarized. In order to condense information further, the entries in the *memoriale* were copied out again in the ledger.

Only in large companies do we find merchants whose main task was

keeping the account books. Typically, several employees would make entries into the different account ledgers more or less continuously. Quite often, there is evidence of more than one hand on a single page in an account book.

Not until sometime during the first half of the fifteenth century was "bookkeeping" taught by teachers or in schools. Before that, although calculation with Arabic numerals was taught in schools, a young merchant would study accounting as part of his education in his company's shops (*botteghe*). Nonetheless, a relatively homogeneous kind of bookkeeping was established because traders had strict contracts among themselves. A merchant from, say, Genoa or Milan could write a letter to his business partners in Tuscany asking them to enter his expenditures for purchased goods in his account in their books, and vice versa.

It is probable that from the beginning, commercial bookkeeping had to serve several simultaneous functions. A primary function was the legal security of the client, the *socii*, and the associates. Thus in the book dating from 1211 we find, in addition to the guarantors, the names of witnesses who could, if necessary, confirm business transactions; and after the bankruptcy of the Peruzzi in 1343, their books were examined by a communal committee. Moreover, there was a growing acceptance of commercial activity in general, and specifically of the widening practice of noting the proceedings; as a result, during the second half of the fourteenth century account books came more and more to be considered valid evidence in courts of law. Baldo degli Ubaldi granted a ledger (which he called *codex rationum*) almost the same evidential value as a notarial document. About 1400, Francesco Datini sent for the account books of his branch in Avignon because he planned to use them in a legal dispute at the Court of the Guild. Furthermore, in some books we find notes (called *ricordanze*) indicating that someone had prepared a legal document regarding one or another business transaction. However, merchants generally did not—as the monk and mathematician Luca Pacioli proposed in 1494—submit their accounts to guild committees or municipal offices for authentication.

Another function of bookkeeping was control over employees. Cashbooks and *spese di casa* books, especially, had to be designed in a way that would make it hard for an unsophisticated employee to

embezzle money. If the balances of cash and cash income corresponded, one could assume proper management. Still, we should note that cashbooks were not always kept with the necessary continuity.

A third function was to maintain exact and quick balances of business transactions, as an indicator of success. In fact, scholars and researchers assumed for a long time that bookkeeping in the Middle Ages served mainly this function, as is the case today; accordingly, they interpreted the further development of bookkeeping as an early indication of a capitalistic, profit-focused mentality among Italian merchants. Double-entry bookkeeping was considered a particularly sensible method of maintaining balances: every financial event had to be entered twice, once as a credit and once as a debit; together, these events formed a sort of closed system with at least five different types of accounts (de Roover 1937,270). In the 1920s, the German sociologist Werner Sombart was one of the first to link capitalistic profit-focused thinking with the abstract concept of enterprise as such (in contrast to a concrete concept of the merchant), and with the method of double-entry bookkeeping. Italian researchers (particularly Melis) also subscribed to this view, and they used surviving fragments of account books to argue that it was applicable in very early times.

The first generally accepted evidence of double-entry bookkeeping derives from the communal account books of the city of Genoa in 1340; and it is stated in these books that they are being kept *ad modum banchi* (in the manner of a bank), so we can assume an earlier use of the method among private merchants. However, the method did not become popular among Italian merchants until the 1380s, and even thereafter it spread relatively slowly. In 1383, Datini changed the bookkeeping of almost all his *fondaci* to the new system; but by the end of the fourteenth century it had been introduced by the Bank of del Maino in Milan for only a short period. The earliest evidence of a "journal" dates from the 1390s; this was not a necessary element of double-entry bookkeeping, but it was a rather important auxiliary book in which the entries were formulated for the assignment of sums to specific accounts. The first actual descriptions of double-entry booking are to be found in *Il libro dell'arte di mercatura* (1459) by the merchant Benedetto Cotrugli and in a chapter of *Summa de arithmetica, geometria, proportioni, et proportionalita* (1494) by Luca Pacioli.

Summa was once believed to be the earliest description; this was not true, but the explanations in *Summa* are more extensive than Cotrugli's and, having already been printed, were disseminated more quickly (Cotrugli's writings were not printed before the mid-sixteenth century).

The rather slow spread of double-entry bookkeeping and its rather late use in tractates suggest that during the fourteenth century the method was considered less advantageous than scholars and researchers may have assumed. Yamey has pointed out that, owing to the rather inconsequential manner in which the method was used by merchants in the Middle Ages, it could hardly have been seen as a suitable instrument for determining gains and losses. Even in the fifteenth century, most of the "balance" sheets of the Medici did not balance, and there is no evidence of efforts to find and correct the mistakes. Therefore, when we consider the world of medieval merchants, the importance of double-entry bookkeeping in particular—and, more generally, bookkeeping as an indicator of success—must be seen in relative terms.

We have so far noted three functions of bookkeeping: legal security, control of employees, and the maintenance of balances in order to indicate gains and losses and hence success. A fourth function—memory—is usually identified as a basic and very old motive for establishing account books. In Italy, moreover, the practice of selling goods on credit (something that was not done by German merchants) made it necessary to note debtors and also creditors, i.e., suppliers. This explains why personal expenditures of that kind were recorded so early and so frequently. In the second half of the fourteenth century, these accounts, kept as memory aids, apparently still formed the core of bookkeeping. For this exclusive purpose, the first company whose accounts were recorded almost completely—a company led by Francesco Datini and Toro di Berto, founded in Avignon in 1367—noted, within a period of less than six years, more than 10,000 lots for several hundred clients. Such a large amount of information can hardly be given an orderly structure ad hoc, and so it needs considerable revision to ensure that the layout of the entries is clear and that no entry can be inadvertently overlooked. The necessary revision of entries written for the purpose of memory was the main reason for copying entries from the *ricordanze* into the *memoriale* and ultimately into the ledger as

described above. In other words, in this context the inevitable restructuring of material had to do mainly with a need to establish a usable base of information by copying entries from a very large number of notes into a new account book. The first steps toward elaborate bookkeeping may have resulted from the function of the method as an aid to memory, and from the necessity of revision.-In any case, for some time the element of bookkeeping that was kept up most consistently was the running of debtors' and creditors' accounts. This is understandable, because a forgotten entry of a debtor most certainly meant a loss of money for the company, whereas a carelessly kept cashbook, for instance, would entail a loss of money only if dishonest employees were involved.

Many connections may be drawn between account books and the *libri di famiglia* in which merchants noted "private" events. There are numerous parallels, including the style of writing (*mercantesca*, which developed from notary italic during the fourteenth century); the names of books (*ricordanze* and *libra segreto* are found in both types of texts); and the structure of entries (births, marriages, and deaths in *libri di famiglia* are frequently listed like entries in an account book in paragraph form). Probably, these similarities arose because merchants used account books so extensively. Furthermore, "personal notes" may be found in business books, and large sections of *libri di famiglia* quite naturally contained commercial transactions.

Bookmaking and Book Production

Three great figures stand out in the world of books in Italy at the beginning of the Middle Ages: Cassiodorus, Benedict of Nursia, and Gregory the Great.

Cassiodorus (c. 490-c. 583) was perhaps the first to have recognized a need to conserve ancient books and texts. He was born into the ordered life of a patrician elite that still maintained the traditions of empire, and he served the Ostrogoth king Theodoric in a number of increasingly important positions. However, Cassiodorus withdrew from politics after Theodoric's death and the subsequent struggles between the Goths and the Byzantines for control of Italy. In later life he witnessed the Lombard invasions which destroyed the last vestiges of the empire in Italy and its ancient culture. During the Gothic conquest, the Roman aristocrats had maintained themselves by becoming a valued bureaucracy for their illiterate masters, and this bureaucracy came to control writing, government documents and records, and books. The Lombards, by contrast, had no use for such services or for the class that provided them. Cassiodorus could look back to a time when the empire

had supported a flourishing book trade, but now, with the collapse of the larger economic system and the social and cultural structures that would support a large-scale secular book trade, book production came to a halt. At about the time of his retirement from public life in about 540, Cassiodorus established his celebrated monastery at Vivarium (though he did not take up permanent residence there for another fifteen years) and began the process of collecting books and making new copies. Book production was at the center of this monastic community, as detailed in *Institutiones* (c. 562), in which Cassiodorus sets out his instructions for scriptorial procedures and practice. Unfortunately, Vivarium did not endure after Cassiodorus died, but his vision of reviving book production in a monastic setting did endure, with great and positive results.

Benedict of Nursia (c. 480-547) is important to medieval book production because of his authorship of *Regula sancti Benedicti*, which became the basis for western monasticism. Actually, books and bookmaking have only a small place in the *Regula*, and the contrast between the early Benedictine community at Monte Cassino and Cassiodorus's Vivarium is striking. But even so, Benedict recognized the necessity of books—both for private study and for public reading—and from that small beginning the Benedictines would go on to create great monasteries across western Europe containing large scriptoria and extensive libraries. It was as if Cassiodorus's vision of a book-centered monastic community had been adopted by the Benedictines. However, the vision that reshaped the Benedictine movement and gave books and book production a central role was not Cassiodorus's but that of Gregory the Great (c. 540-604).

When the monastic community founded by Benedict at Monte Cassino was forced to flee in the face of the Lombards' attacks, the monks sought refuge in Rome. Here, in Gregory, they found friendship and the support of a fellow monk. As pope (590-604), Gregory began to emphasize bookmaking as a significant and important part of monastic life. Books were essential to Christianity; and Bibles, liturgical works, and other patristic books were required for the church to function. These books had to be supplied, and in addition Gregory was a prolific author who wanted his own works to circulate. Whatever might have been left of the old secular book trade in Rome, it was insufficient to

meet Gregory's needs. His solution was to put his fellow monks to work copying books, an act that permanently changed the nature of Benedictine monasticism. Wherever the Benedictines went and established new monasteries, they brought books and bookmaking. In Italy this was particularly true in Farfa, San Vincenzo at Volturmo, San Salvatore, and the restored Monte Cassino.

At this time books had several forms. The most common format was the codex, but rolls and wax tablets continued to be used. Each format had its appropriate use. The roll, which had been the dominant format in the ancient Greek and Roman worlds, was used for documents in the Vatican archives well into the Middle Ages. Likewise, the wax tablet—usually consisting of several wooden tablets hollowed out on one side, filled with wax, and then joined together with thongs, like a notebook—remained a common writing surface through much of the medieval period for initial composition, correspondence, notes, or business memorandums. Wax was a medium that allowed for exceptionally quick writing, using a stylus; and later the surface could be easily smoothed for reuse. At the time when Gregory was reviving book production in Rome, the wax tablet, the papyrus roll, and the parchment codex each had a specific and integrated role in bookmaking. Gregory's *Moralia*, a commentary on the Book of Job, is a case in point. Before becoming pope, Gregory had served as papal ambassador in Constantinople, where he preached a series of sermons on the Book of Job. These sermons were taken down in shorthand by a stenographer on wax tablets, in a highly abbreviated cursive script. Soon afterward, the text was transferred, still in an abbreviated cursive form, to papyrus rolls, and the wax tablets were smoothed over for reuse. Thirty-five papyrus rolls were used for *Moralia*. After Gregory became pope, the text was transferred to parchment codices, six in all, written in a careful set uncial script using few abbreviations beyond the *nomina sacra* (holy names). While the codex was certainly the end product, the wax tablet and the papyrus roll played important and integrated parts in the production of the text. Papyrus rolls may have continued to be used in this manner for some centuries, but as papyrus became expensive and difficult to acquire, the small quantities of available papyrus were used for more permanent purposes. Wax tablets, on the other hand, continued to be used for initial composition for

many centuries to come, and it was only with the rise of scholasticism in the eleventh and twelfth centuries that authors changed from the ancient mode of dictating to a secretary who wrote using a wax tablet to the modern mode of composition by the author using a pen and parchment (or paper).

As important as the Benedictines were to the survival of books in the early Middle Ages in Italy, other monastic influences were also present. In particular, the great Irish missionary monk Columbanus (d. 615), after having established a series of Irish monastic houses, including Luxeuil and Fontaines in Gaul, spent the last months of his life in Bobbio, a monastery on the Trebbia River in Northern Italy. Bobbio, like the other Irish establishments on the continent, soon became an active center for book production. However, it has been celebrated particularly for its extensive reuse of older manuscripts: these palimpsests preserved within their primary texts several ancient works that would otherwise have disappeared. Although the Roman and Celtic churches disagreed on a number of doctrinal points, particularly on calculating the date for Easter, they were in complete agreement on the importance of book production. When the Celtic houses were subsumed by the Benedictines, many things changed, but not the central place of books and bookmaking in the life of the community. Bobbio became one of the greatest Benedictine houses in northern Italy.

Monastic book production was relatively uniform across Italy and indeed much of the rest of western Europe, although a distinctive Italian script developed in the eighth century and survived for many centuries in the south (where it is called Beneventan), beyond the reach of Carolingian reforms. In the Benedictine houses the scriptorium, where book production was undertaken, was generally a large room that might also have served as the library (which more often than not was simply a chest full of books). The librarian—the *amarius* or *bibliothecarius*—was often in charge of the scriptorium. Depending on the size of the monastery and the scriptorium, there might be several classes of scribes, though such distinctions varied with place and time. Scribes might be distinguished as senior (*anti-quariti*) and junior (*librarii*). There might also be rubricators, miniators (or painters), illuminators, and correctors. Before the twelfth century, scribes were almost always monks, but after this time there began to develop a class

of professional scribes, often employed by monasteries. Monastic scribes generally worked about six hours a day copying. Copying and their religious duties accounted for all the daylight hours; artificial light was rarely used. Silence was imposed on the scriptorium in the sense that conversation was forbidden, and in order to communicate the monks devised an elaborate system of hand signals. But the copying itself was not silent. Silent reading was a development of the eleventh and twelfth centuries. Before that time, each scribe essentially dictated to himself, and the scriptorium was filled with a dull murmuring.

Beyond a text to copy, bookmaking required parchment (later paper), ink, and pens. Parchment, usually thick and rough, has traditionally been made from sheepskin; and vellum, thinner and finer, from calfskin—though in practice it is difficult to determine the origin of any finished skin. Skins were usually soaked in a lime solution for three to ten days, washed in water, and then stretched on a frame and scraped. Parchment, or sheepskin, was scraped only on one side; vellum, or calfskin, was scraped on both sides. When the skin was dry, it was wet slightly again, and then it was pounced (rubbed with pumice) to smooth the surface and remove blemishes. The skin was then completely rewet and dried again under tension. Finally it was finished again by pouncing, and perhaps by rubbing chalk or some other compound into it to give the skin a smooth white surface which would take ink but would allow no bleeding.

An alternative to parchment in the later Middle Ages was paper, which had the advantage of being much less expensive, although it was not as durable. Paper was introduced into Italy in the eleventh century by the Muslims in Sicily. By the first half of the thirteenth century paper mills were active in Fabriano (where paper is still made today) and in the hills above Genoa. Italian papermaking was a departure from the traditional techniques used by the Muslims. The Italian papermakers used large hammers embedded with nails to pulverize the fermented rags (usually linen); rigid molds made of wires (which allowed an innovation, the watermark) with removable deckles that were immersed into vats of suspended rag pulp to create sheets of paper; new drying techniques; and sizing (an additive which kept the ink from bleeding). From these small beginnings we can trace the origin of western paper manufacture. Within fifty years after the introduction

of paper, many mills were operating in the hills of central Italy and in the north, producing paper of exceptional quality, and soon Italian paper was being exported throughout Europe and the Mediterranean. By the fifteenth century, mills were operating in France and north of the Alps; these curtailed the demand for Italian paper to some degree, though Italian paper always enjoyed the reputation of being of the first quality.

Having selected a writing surface, the scribe might need to prepare ink. Iron-gall ink was made by mixing pulverized plant galls with ferrous sulfate (commonly known as copperas) and gum arabic to give it viscosity. More often than not, the ink was already prepared for the scribe, and at most he might need to mix the powdered ink with water.

The third requirement was a pen. This was a reed in the Middle Ages, and a quill later.

With the appropriate materials before him—the parchment or paper (or perhaps both), ink, and pen—the scribe first produced a quire, or a gathering of leaves. This could be accomplished in two ways. The more traditional way was to take four sheets of parchment or paper, fold each once, and then nest one inside the other, thus creating a booklet or quire. This was naturally the easiest method with large books. With smaller books, it was easier to use the folding method. By folding the sheet twice, one obtained a quire of four leaves or eight pages; by folding it three times one obtained eight leaves or sixteen pages—the standard quire size during the Middle Ages (though this varied with place and time).

For the parchment book, it was essential that the sheets be positioned so that the hair, or outer, side of the skin always faced another hair side—and likewise that the flesh, or inner, side of the skin always faced another flesh side. The hair side of a skin is yellower and rougher than the flesh side, which is often milky-white. For aesthetic reasons, it was essential that at any opening of the book the reader would see only one color and texture of skin. If the sheets were arranged properly the reader was never even aware of a difference in the sides of the skin, but should hair face flesh the difference could be jarring. If the quire was constructed by the folding method, it would automatically form the correct pattern of hair and flesh. Naturally, however, there were unsolvable problems in arranging the hair and flesh sides when it was

necessary for textual or other reasons to add an extra leaf, or bifolium.

The next step was to prick the quire. This produced a series of small, almost invisible, holes which acted as guides for ruling each page. In addition to pricking along the side margins, it was also usual to place several prickings along the top and the bottom so as to delineate the textual frame. The quire might be pricked folded; this was the most efficient method, as it required prickings down only one side of the leaf. Or the quire might be pricked flat; this method required prickings in both outer margins. After the quire was pricked, it was ruled. There were three major modes of ruling. The first, usually associated with the early Middle Ages (though also commonly found in humanistic manuscripts of the fifteenth century whose writers adopted Carolingian practice in the belief that it was Roman), was the use of a stylus that created a furrow as it was pulled across the surface. This method produced nearly invisible ruling and had the advantage of producing multiple rulings, on both sides of each sheet stacked in a pile. It was, however, rather unsuitable for paper, as the stylus could easily rip or tear the surface. The second method of ruling, usually associated with the middle of the medieval period, was to use lead plummet, an early form of pencil. The third method, most common at the end of the Middle Ages, was the use of pen and ink. No doubt this was a result of the increased use of paper in book production during the period. Both lead plummet and ink were far less efficient than drypoint ruling, as each side of each sheet had to be individually ruled.

Now the scribe was ready to write. In the ancient world dictation to a group of scribes had been quite common, but medieval scribes copied individually. The desk was at an angle, and often the scribe would write with one hand and hold a penknife in the other to keep the writing surface in place; the knife was also useful for making erasures by scraping off the wet ink. The normal method of writing was to begin on the first page (the recto of the first folio) of the quire and copy the text straight through in its natural order. The scribe had to pause after finishing each recto (except for the middle bifolium) before going on to the verso in order to let the ink dry. As the scribe finished each page, he would take a fine-nibbed pen and lightly write instructions in the margin on how to fill blank spaces with rubrics, decorations, capitals, pictures, and the like. These instructions have rarely survived, because

they were usually trimmed away by the binder.

After the scribe had finished copying a quire, it was often checked by a corrector. The corrector's job was to compare the exemplar with the copy and make sure there were no errors. When errors were found, they might be erased by scraping off the ink with a knife, or by applying a lightly acidic solution to loosen the ink. The corrector could then supply the proper reading. In many instances the corrector simply lined through the error and supplied the correction interlinearly or marginally.

Rubrication, the next stage, was almost invariably red (*rubrica* is red earth or red ocher). Typically, it consisted of chapter headings or, in more specialized texts such as commentaries, the word or phrase being glossed. In addition, the rubricator might supply colored paragraph marks and highlight capital letters in the body of the text.

The decorating, painting, and illumination could be a complex process involving several scribes and artists. After a base coat was applied, the next step was usually to make an outline in pencil (lead plummet) and then ink. If there was to be any illumination, or gilding, it was done before paint was applied, so that the paint could cover any rough edges. Each color was applied in turn and allowed to dry; the final step at this stage was the application of stipple, or white highlighting.

The end of the bookmaking process was binding. The binder would make sure that the sheets or quires were properly assembled and ordered. The gatherings were placed in a sewing frame and attached with linen thread to several leather thongs, flat or twisted strips of vellum, or cords—known generally as bands once they had been sewn to the text block—which give medieval books their characteristic "ribbed" appearance. A binder might supply a bifolium, of vellum or paper, which would serve as a pastedown and a free endpaper, or he might supply several bifolia that functioned as flyleaves. The book might be soft- or hardbound. A softbound book was usually covered in vellum, though stiffened leather was also used. A hardbound book was bound in stout boards and covered in leather or pigskin. During the medieval period, the boards were made flush with the text block because books were stored on their sides. As a protective measure for books that were laid flat, medieval binders added metal bosses and

metal corners to the covers. Titles were written on the fore-edges but not on the spines, and covers were usually held together with metal clasps. The covers might be decorated with simple tooling, more detailed panel stamping, or even elaborate metalwork laden with jewels. Yet most ordinary medieval books had only modest bindings with little decoration, and indeed many books had no bindings at all beyond a protective piece of parchment that was wrapped around the quires of the book and might or might not be loosely attached.

With the Gregorian reform of the eleventh century, there was a shift away from the monastic scriptoria, as cathedral and abbey schools became more important and as cities and merchants developed notarial needs. The newly established mendicant orders of the Franciscans and Dominicans were often associated with the new universities and obtained their books from the book trade in Bologna and other Italian university cities. The universities created a new reading public that required new texts, reference works, and commentaries. The new secular book trade became a licensed appendage of the university (before the end of the thirteenth century in Bologna); this trade consisted of stationers, scribes, parchment makers, papermakers, bookbinders, and others associated with making books. They enjoyed certain rights, such as an exemption from taxes and the right to be tried in university courts. The same book tended to be sold and resold through many generations, and it was the stationer's responsibility to sell a book, buy it back, sell it again, and so forth. He could buy and sell only under certain conditions: he had to advertise the titles he had in stock; prices were fixed; and students and professors received discounts.

In order to produce the large numbers of textbooks required by students and maintain their textual accuracy, the *pecia* system of copying was instituted. The system began in Italy c. 1200 and ended c. 1425-1450. It existed in at least seven universities in Italy and many others across Europe. The stationer held one or more exact copies (the exemplar) of a text in pieces (hence *Pecia*), usually a gathering of four folios (sixteen columns) or perhaps six folios. Each column had to have a standard number of lines (usually sixty), and each line a standard number of letters (usually thirty). Each part was rented out for a specific time (a week at Bologna) so that students or scribes could copy it. In this way a number of people could be copying parts of the same

book at the same time. Stationers were required to rent pieces to anyone who requested them, and the charges were fixed (e.g., at Treviso in 1318 the charges were six pence for copying, and two pence for correcting).

In thirteenth-century Italy, there was no single center of book production that provided an authoritative model for the whole country (as Paris did for France). Monte Cassino still maintained the old monastic customs, as was also true in Rome and Tuscany. Bologna had developed its own style of script and bookmaking, which was adopted in the universities of Padua and Naples. The aristocratic courts in the cities of the northeast eagerly consumed locally produced deluxe copies of Provençal lyrics and French epic poetry and romances. But even though no single style of book was dominant in Italy, certain trends were evident. During this period books became smaller, script became more compact, and the number of abbreviations increased. The two-column format became the norm, and ornament was almost abandoned on all books except those for the luxury trade. Scholastic texts became more complex, and this complexity was reflected in the organizational design and layout of books. In this regard, the developments included dividing the text into chapters and subchapters and adding tables of chapter headings, alphabetical tables by subject, and running heads. New forms of punctuation, such as colored paragraph marks, were introduced. Quotations were underlined in red, marginal notes were added, and diagrams were supplied. The resulting multistructured apparatus, perhaps most commonly seen in a glossed Bible or Psalter, was visual and was meant for a reader, not a hearer. Soft bindings tended to replace wooden boards, and parchment became progressively thinner as the number of folios per gathering increased. Ultimately, paper replaced parchment altogether.

By the end of the thirteenth century another reading public was emerging in the cities of Italy, comprising merchants, artisans, civil servants, and women. The commercial book trade that developed in Milan, Florence, Venice, Rome, Naples, and other Italian cities catered to these customers and therefore specialized in vernacular books, written in common everyday scripts such as *littera mercantesca*. Spurred on by a demand for books of hours, a particular favorite of women, the new urban book trade completely replaced the monastic

scriptoria as producers of deluxe illuminated books. Books of courtly poetry, which had been produced in Provençal for traditional aristocratic readers, were now translated into Italian for the new urban readers. And of course vernacular prose and poetic works from such great Italian authors as Dante (1265-1321), Petrarch (1304-1374), and Boccaccio (1313-1375) soon filled many volumes. It was in these volumes, especially those of Petrarch, that a new model for Italian books emerged. Petrarch rejected the medieval Gothic book, particularly because of its ugly, cramped script and its awkward size. He advocated a much more legible and less abbreviated script based on Carolingian minuscule, which he believed to be the script of the ancients. He also advocated a much smaller and more manageable book that would easily fit the hand and make reading an easy and comfortable act. He was ultimately concerned with the book as an extension of the authorial persona. In Florence at the end of the century, Niccolò Niccoli (1364-1437), a merchant and scholar; Poggio Bracciolini (1380-1459), a young scribe; and the statesman Coluccio Salutati (1331-1406) created the mature model envisioned by Petrarch. Though it was not the small, intimate book Petrarch had hoped for, it was nonetheless elegant, legible, and authoritative. The humanist book of the fourteenth century is a hallmark of the Renaissance and remains today an unquestioned model for fine bookmaking.

Botany and Botanical Lore

Like animals, plants of every imaginable kind made their way into early Christian literature, which eventually became a source for the herbals and medical texts of the late Middle Ages. Among the earliest church fathers to gather information about plants systematically was Melito, bishop of Sardis (d. 190), whose *Clavis scripturae* (*Keys to the Scriptures*) was composed of several books: *De bestiis*, *De lignis et floribus*, *De avibus*, and *De mundus*. In the section *On Wood and Flowers*, Melito offers brief symbolic attributes of plants based on the scriptures. This approach to the natural world was later amplified in works such as sermons by Ambrose, bishop of Milan (Saint Ambrose, d. 397; *Hexameron*, "Paradise," "Cain and Abel"), and the early church

father Basil (c. 329–379; *Homilies*). These were followed by the encyclopedic, theological, and narrative texts of later medieval writers such as Saint Aldhelm, abbot of Malmesbury (d. 709, in *Aenigmatum liber*, or *Book of Riddles*); Hrabanus Maurus (c. 784–856, in *De universo mundi*); Hildegard of Bingen (c. 1099–1179, in *De physica*); Petrus Comestor (eleventh century, in *Historia scholastica*); Herrad, abbess of Landsberg (c. 1130–1195, in *Hortus deliciarum*, or *Garden of Delights*); Albertus Magnus (bishop of Ratisbon, 1193–1206); Bartholomaeus Anglicus (fl. c. 1220–1240, in *De proprietatibus rerum*, or *On the Properties of Things*); and Petrus de Mora (in *De rosa*).

Very early in medieval botanical literature we find comments and commentaries on plants that diverge from the the early church fathers; these follow instead the Aristotelian approach of documenting natural phenomena, as exemplified in *Theophrastus (On the Enquiry into Plants)*. From the Aristotelian tradition emerged the first compilations of plant descriptions and lore that had medicinal value. For example, Pliny the Elder's *Natural History* (second century B.C.) was a major source of plant lore in the Middle Ages. Aemilius Macer Floridus's *De viribus herbarum* (*Rufinus's Herbal*, c. 16 B.C.) was copied frequently during the ninth through twelfth centuries, when it was sometimes called *Materia medica* or *De viribus herbarum*. A version under the title *De viribus herbarum* was one of the first printed books. In this apotropaic tradition, the work that was most famous and most frequently copied and cited was by Apuleius Barbarus Sextus (c. 400); it was known under several titles: *De medicaminibus herbarum*, *Herbarius Apulei Platonici*, *Herbarium se Sextus Apuleius Barbarus*, and *De herbarum virtutibus*. A notable example of medicinal herbals is a Greek herbal by the physician Dioscorides Pedanius of Anazarbos (c. 40–90); the earliest surviving manuscript is the beautifully illustrated *Dioscorides* of Anicia Juliana (512). Walafriad Strabo's *Hortulus* (c. 840) deals with plants strictly from a gardener's and poet's point of view, offering no symbolic analogies but some lore about the medicinal value of each plant mentioned.

In the late Middle Ages there was an infusion of Arabic texts on the medicinal value of plants, particularly in and around Arabic-Italian communities of southern Italy such as the one at Salerno, and a type of medical book combining eastern and western lore emerged in the

thirteenth century. Among books of this type is *Circa instans* by Matthaes Platearius (c. 1130-1161), a larger version of the Salernitan texts, which were usually small books called *Pocketbooks of Health* (*Taccuinum sanitatis*) or *Pocketbooks of Salerno* (*Taccuinum salernitatum*). These books purported to be based on secret knowledge of curative and poisonous attributes of plants.

The encyclopedists often integrated apocryphal lore with references to scripture and to the sermons of the church fathers; following their works, another form of commentary on plants emerged in popular literature and travel narratives. These texts include *L'acerba* (c. 1314) by Cecco d'Ascoli (1269-1327); *Mirror of Human Salvation* (*Speculum humanae salvationis*, anonymous), which was probably based in part on *Mirror of Nature* (*Speculum naturale*) by Vincent of Beauvais; and various "leg-ends"—of Seth, the infancy of Christ (*Protoevangelary Infancy*), Adam and Eve, the unicorn, and the oak. Other works in this vein include Herrad of Landsberg's *Hortus deliciarum* and the *Golden Legend* (*Legenda aurea*) of the prelate Jacobus da Voragine (1228 or 1230-1298). Popular Italian poetry dedicated to the Virgin, though based on prototypes found mostly in Psalms, abounds in references to Mary as a rose, a violet, a *hortus conclusus* (enclosed garden), and a wreath of flowers (*ghirlanda*).

By the fourteenth century, a significant amount of information on plants had been accumulated, including apocryphal lore, symbolic commentaries, and medicinal herbals. Each type of information was treated in its own separate category and used for some particular end—therapeutic, homeopathic, symbolic, poetic, or practical (as nourishment).

In the fifteenth century, there was a brief nourishing of plant symbolism that would continue to have an impact for the next two centuries; but this symbolism was of a different character from that in the Middle Ages and included another ingredient: legends from classical literature. Much later, in the eighteenth century, this large body of plant images and lore would be transcended by a rationalistic approach, and the documentation of Linnaeus would supersede ancient and Christian traditions in an attempt to achieve completely objective observation and scientific classification.

Brescia

Brescia occupies a strategic position at the mouth of Val Trompia on the road from Verona to Bergamo. It was originally the capital of the Cenomani Celts of Cisalpine Gaul. It became an ally of Rome in 225 B.C. and an imperial colony under Augustus in 27 B.C. The rectangular city plan preserves traces of the Roman plan, and significant remains erected by Vespasian in the first century after Christ survive. By tradition Brescia was the main suffragan see of Milan, and according to legend, the first bishop was consecrated by Barnabas, the companion of the apostle Paul. The city was certainly an episcopal see by the end of the fourth century, when Gaudentius (died c. 410) is recorded as bishop.

Brescia was sacked by the Huns under Attila c. 450 and conquered by the Lombards in 596. According to Paul the Deacon, it became the seat of several Lombard noble families, and by 601 it was the seat of a duchy under Rothari (d. 652), later king of the Lombards. Desiderius, the last Lombard king, was duke of Brescia before he obtained the crown in 756. His wife Ansa founded the Benedictine monastery of San Salvatore, which subsequently became one of the most powerful monasteries in northern Italy as a result of royal patronage. Early in the Carolingian period, the Frankish Supponid family obtained comital privileges in Brescia. Through royal gifts and fiefs the Supponids assembled extensive holdings in Lombardy and western Emilia. In the succession crisis following the death of Louis II in 875, they were crucial supporters of their kinsman Berengar I (d. 924), duke of Friuli, who became king of Lombardy in 888. During Berengar's reign, a threat of Hungarian raids led to the fortification of the city and its suburbs.

By the beginning of the eleventh century, Brescia was part of a trading network that included several Lombard cities to which it was linked by the Oglio River. A growing prosperity was reflected in the construction of a new cathedral over the sixth-century basilica of Santa Maria Maggiore, of which floor mosaics survive. The cathedral, known

as La Rotonda because of its central plan, is a good example of Lombard Romanesque. Sources of this period refer to a count of Brescia, but the bishop appears to have been the dominant political figure. There is evidence that the citizens conducted diplomatic negotiations as early as 969; and in 1038 an association of 154 citizens forced Bishop Uldericus to concede jurisdiction over territory adjacent to the city. The bishops nevertheless remained powerful well into the twelfth century. In 1139, Bishop Manfred (d. 1153) secured from Innocent II the condemnation and exile of Arnold of Brescia (d. 1155), whose teachings on poverty and church reform supported a citizenry independent of the church's control.

The first reference to a commune and a citizens' assembly dates from 1120. By 1127, the commune was appointing magistrates called consuls, drawn from powerful local families. The Brescian commune allied itself with Milan, Bergamo, and Mantua against Emperor Frederick I and joined the first Lombard League in 1167. In the mid-twelfth century, a senior consul appears to have exercised authority over a college whose number varied, while merchant consuls oversaw trade, perhaps in connection with the establishment of a new market in 1173. After 1182, consuls alternated with a *podestà* (podesta, a chief magistrate). The

influence of Milan over Brescian affairs was reflected in the appointment of the Milanese Guglielmo de Osa as the first podesta. Several buildings survive from the communal period. The Torre del Popolo at the northern end of the Piazza del Duomo dates from the eleventh century. The adjacent palace of the commune, the Broletto, was begun in 1187 but was not completed until 1235. The defensive walls were enlarged in 1184-1186 and again between 1235 and 1249; the Castello that dominates the city from the Cidneo Hill was rebuilt by the Visconti in the fourteenth century. The Romanesque churches of Santa Giulia and Santa Maria in Solario were built in the twelfth century. Though much altered in the fifteenth century, the Romanesque-Gothic church of San Francesco retains its thirteenth-century plan and facade.

By 1200, Brescia was dominated by armed aristocratic factions whose conflicts reflected the quarrels between Guelfs and Ghibellines in Milan. After 1227, Brescia sided with the Milanese Guelf faction of the della Torre against Frederick II, who unsuccessfully besieged the city in 1238. The commune's victory was short-lived: beginning in 1258 Brescia was held in succession by the Ghibelline *signori* (lords) Ezzelino da Romano, Oberto Pallavicino, and Buoso da Dovara, passing finally to the Guelf Charles of Anjou in 1266. The growth of the *popolo*, a broader-based association of citizens, was reflected in this period by the expansion of the communal council to 2,000 members, the establishment of popular institutions parallel to those of the commune, and the construction of a Palazzo del Popolo in 1285. These developments, however, coincided with a rise in factionalism that perpetuated the domination of the city by a succession of *signori* in the second half of the thirteenth century.

In 1311, Brescia was captured by Emperor Henry VII and incorporated into the Veronese empire of the della Scala. Reconquered for the Guelfs in 1316 by Robert of Anjou, the city was forced to seek protection against Ghibelline exiles by placing itself under the lordship of John of Luxemburg, king of Bohemia, in 1330, only to be taken two years later by Mastino della Scala. In 1339, Azzone Visconti, who had been elected *signore* of Milan, captured Brescia. Thereafter, except for a short period under the Malatesta early in the fifteenth century, the city remained under the control of the Visconti until 1426, when it was conquered by the Venetians.

Brindisi

Brindisi, in a sheltered inlet beyond a natural harbor on the Adriatic coast, has been an important port city since its origins. According to various legends it was founded by the Greek Diomedes, returning from the Trojan war, or by Cretans from Knossos; but it seems to have developed by the seventh or sixth century B.C. as a port town used by a local people, the Messapians, in their trade with neighboring Greek settlements. For a long time, it competed with the important Greek city of Taranto (Tarentum) for domination of the "heel" of Italy. However, the true significance of Brindisi began in 266 B.C. with its incorporation into Roman Italy, and with its eclipse of Taranto when that city fell to Rome during the Pyrrhic war. Brindisi formally became a Roman colony in 244 B.C. as Brundisium. It was rewarded for its steadfast loyalty to Rome after the battle of Cannae, and it became the chief Roman naval base during the Punic war and the wars against the Illyrian pirates.

Meanwhile, the Via Appia, running to Taranto and terminating at Brindisi, was completed in the late third century B.C.; its completion made Brindisi the Mediterranean gateway for Rome and the principal port for traffic to and from Italy. Brindisi also offered a junction with Via Egnatia, which extended from Aquileia in northern Italy across the Balkan Peninsula and connected to Thessaloniki and eventually to Constantinople; thus Brindisi soon became the counterpart of Durazzo (Dyracchium or Epidamnus, modern Durres in Albania) across the Adriatic. In 49 B.C., Caesar attempted to bottle up his rival Pompey in Brindisi, and nine years later Brindisi was the venue for the *foedus brundisium*, a brief reconciliation between Mark Antony and Octavian; both events suggest the importance of the city. After peace was restored, Horace described the journey from Rome to Brundisium in a famous satire; and here, on 21 September 19 B.C., the weary Virgil died upon returning from Greece—according to local tradition (and a plaque), the house by the harbor where he died, or at least its site, can be identified. Brindisi became even more accessible when Trajan constructed an alternative coastal road, Appia Traiana, opened in 109 A.D.; its terminus at Brindisi's harbor was marked by two columns, one

of which still stands. Under the Romans, Brindisi remained prosperous for generations, as travelers of every stripe, from emperors to slaves, passed through it to enter or leave Italy by sea.

Tradition dates the beginning of the Christianization of Brindisi to Saint Leucio in the second century, and it became the seat of a bishopric. But with the disruption of Roman rule, Brindisi began to decline. After being held for a time by the Ostrogoths, it was retaken by the reconquests of Justinian and was used as a command post by Byzantine generals in their struggle with Totila. In the second half of the seventh century it passed into the hands of the Lombards, becoming the southernmost holding of the duchy of Benevento. It was devastated repeatedly by raiding Saracens, who briefly occupied it until 868, when the Frankish emperor Louis II destroyed it. With the restoration of Byzantine government in Puglia (Apulia) in the late tenth century, Brindisi was revived, and its bishopric—which had been removed for some time—was not only restored but elevated to an archbishopric, under the see of Constantinople. Nevertheless, Brindisi suffered in recurrent wars between the Byzantine rulers and the dukes of Benevento. Then it became a prey of the Normans, who finally occupied it in 1071, when they also took Bari. The victorious Robert Guiscard awarded Brindisi to his brother Godfrey, but it became a crown possession under Roger II (1095-1154), the son of another brother of Robert Guiscard. Under Roger and his successors the city was a pivot for the Normans' naval operations. At the same time, the revival of maritime traffic in the Mediterranean, the recurrent passage of crusaders, and the rapid expansion of pilgrimages all made Brindisi once again a lively and significant port and commercial center.

Until the 1150s, the Byzantines made sporadic efforts to recover the city, culminating in the machinations of Emperor Manuel I, but without real success. (By tradition, some of the city's churches were allowed to retain the Greek rite.) In contrast, Brindisi was one of the strongholds of the last Norman king, Tancred of Lecce, in his struggle with the Hohenstaufen claimant, Emperor Henry VI. Henry's son Frederick II (1194–1250) granted Brindisi numerous privileges, but he also built one of his strong fortresses there, and passed it on to his own son Manfred.

With the coming of the Angevins, Brindisi received new fortifications, an arsenal, expanded port facilities, new churches, and

further privileges. But the price was a disruptive involvement in the dynastic wars that plagued the Angevin realm during the fourteenth century. Brindisi was sacked in 1352 by Louis the Great of Hungary, of the Durazzo branch of the Angevins; and in 1383 by Louis I of Anjou, of the Neapolitan branch. The sack of 1383 was followed by the stormy lordship of Raimondo Orsini del Balzo and the ravages of his policies of war.

During one phase of Aragonese rule, efforts to protect the city from Turkish attacks prompted alterations of the port entries that nearly destroyed the harbor. In 1456, an earthquake badly damaged the city; Ferdinand of Aragon sponsored its rebuilding. For a brief time (1496—1509), Brindisi was held by the Venetians. The reestablishment of Spanish rule initiated an era of decay and decline that was not arrested until 1869, when the opening of the Suez Canal revived Brindisi's commercial prospects.

The city today still preserves a number of fine medieval monuments. The Romanesque cathedral, which incorporates elements of earlier construction, was first dedicated by Urban II in 1089, and work on it continued until 1132. Frederick II celebrated his marriage to Yolanda of Jerusalem at the cathedral in 1225. Although it was considerably rebuilt in the eighteenth century; it still preserves noteworthy sections of mosaic pavement dating from 1178. Particularly interesting is San Giovanni al Sepolcro, a large circular baptistery built by the Knights Templar in the late eleventh century on the remains of an early Christian structure and later passed from the Templars to the Hospitallers (Knights of Saint John). Its horseshoe-shaped ambulatory has columns with some finely sculptured capitals, and its walls are decorated with thirteenth- and fourteenth-century frescoes.

Another early Romanesque church, San Benedetto (1080), has imaginative interior and exterior sculptural decoration and a lovely cloister. The Romanesque church of Santa Lucia preserves interesting architectural and decorative features, although it has been repeatedly rebuilt and altered. The crypt (1225) is especially fine, and the church itself retains fragments (twelfth-fourteenth centuries) of what must originally have been extensive fresco decoration. The small thirteenth-century Chiesa del Cristo (del Crocifisso) has a richly decorated facade, and the interior preserves a thirteenth-century wooden crucifix of unusual significance.

The Swabian castle (1227) is largely a construction of Frederick II, with subsequent additions by Ferdinand of Aragon (1481) and Charles V (1550). The Palazzetto Balsamo is notable for its charming sculptural decoration (early fourteenth century).

Just outside the old city are two more monuments of interest, the Fountain of Tancred and Santa Maria del Casale. The Fountain of Tancred, along the main road to the west of the castle, is said to have been built in 1192 to commemorate a political marriage: that of Eirene Angelina, daughter of the Byzantine emperor Isaac II Angelos, to Roger, the ill-fated son of the equally ill-starred Tancred of Lecce, the last Norman king. (After Isaac and Tancred were defeated, Eirene was married off by the victorious Hohenstaufen emperor, Henry VI, to his

brother, Philip of Swabia.) Tradition has it that the Fountain of Tancred was a favorite stopping-place for pilgrims and crusaders on their way into the city.

About 3 kilometers (1.8 miles) north of the city center is the impressive church of Santa Maria del Casale, an ambitious structure in mixed Romanesque-Gothic style erected in the late thirteenth or early fourteenth century by Philip of Anjou, prince of Taranto. Its facade is decorated with elaborate geometric designs in two-color stone mosaic. There is also handsome sculptural work, and the interior has unusually fine frescoes: a grand Last Judgment, signed by Rinaldo da Taranto, plus a full cycle of supplemental scenes, all in the Byzantine revival style of the early fourteenth century.

Bronze Doors

Bronze (an alloy of copper and tin) was one of the most prestigious materials in antiquity, and the casting of doors in bronze, requiring considerable technical expertise, was highly prized. Bronze doors still survive from antiquity and can be seen, for example, at the church of San Giovanni in Laterano in Rome. These are plain, without figurative illustrations.

In the Romanesque period bronze doors became a fashionable and costly feature of prestigious programs of church decoration, especially in the Italian peninsula. The principal difference in their design, in comparison with antique doors, was in the introduction of narrative illustrations, usually scenes from the life of Christ or scenes having to do with local saints. Narrative is one of the key elements of Romanesque art.

Italy in the eleventh century did not have a tradition of bronze casting comparable to that developed in Germany at the end of the tenth century under the Ottonian rulers, or to that found in the Byzantine empire. One option, therefore, was to commission and import doors wholesale from elsewhere. An early example of this practice can be seen at Amalfi in southern Italy, where the doors for the cathedral were imported from Constantinople. Their design consists of incised figures with inlaid silver heads, hands, and feet (most of the silver has, however, been removed). These doors have an inscription giving their date (1066) and the name of their donor, Mauro, who came from the Mauronne family of Amalfi—wealthy merchants with trading links in Constantinople. Saint Mark's in Venice has similar doors, which were obtained from Constantinople; its central nave door, however, was commissioned locally by Leo da Molino (who is himself represented on them, prostrate before Saint Mark) in or c. 1112 and is generally thought to have been made in Venice.

In contrast, it is thought that a team of itinerant metalworkers from Saxony in Germany were hired to produce the original doors for the church of San Zeno in Verona, in northern Italy. These are very different in style and technique from the Byzantine doors discussed above. They are unusually wide for church doors, probably as a result of enlargement at the end of the twelfth century. These doors have forty-eight bronze panels attached to a wooden backing, with figures set off in high relief. Two distinct styles have been distinguished in their execution: the earlier of the two styles is roughly contemporary with

the construction of the church in the 1130s and was probably produced by the team of Saxon artists; the later additions belong to the late twelfth century and appear to be the product of local artists, as their figure style is very close to that of the portal sculpture. The doors have illustrations from both the Old and the New Testaments as well as from the life of the titular saint, Zeno.

In the second half of the twelfth century bronze casting in Italy began to flourish, and indigenous workshops arose. Two distinctive artistic personalities stand out: Barisano of Trani and Bonanno of Pisa. In an age when artists are usually anonymous, the fact that they are identified by means of inscriptions is an indication of their status.

Barisano of Trani was responsible for executing the doors of the cathedral in Ravello (which bear the date 1179) and at Trani. He worked closely within the Byzantine tradition, although using low relief rather than the silver inlay technique favored by the Byzantines. The doors at Ravello may be taken as representative of his work. They contain largely single-figure subjects, principally the apostles, but also narrative scenes from the New Testament such as a Deposition. Barisano appears

to have reused molds, as subjects identical to those found at Ravello recur in other works by him. Barisano later worked on the most prestigious artistic commission of the period, the great monastic church—later the cathedral—of Monreale, near Palermo, which the last Norman ruler of Sicily, King William II, commissioned as a dynastic mausoleum. Barisano was responsible for the doors on the northern side of the church, which provide an entrance to the nave and are usually dated between 1185 and 1189. These doors are in low relief and have largely single-figure subjects.

Bonanno of Pisa's style and technique may be aligned with the German tradition found at San Zeno in Verona, grafted onto indigenous artistic traditions. His most important commission was for the doors of the west facade of the cathedral of Pisa, which were completed in 1180 but were destroyed by fire in 1595. Bonanno's doors for the south transept (the Porta di San Ranieri), however, survive. They contain narrative illustrations from the life of Christ, beginning at the bottom left with an Annunciation and ending at the top right with an Ascension, and, above that, a double panel representing Christ and the Virgin Mary enthroned. Between these narrative scenes are interspersed figures of prophets. A noteworthy feature in certain scenes on these doors is the presence of palm trees, which give a sense of place. Bonanno of Pisa also worked at Monreale, where he was responsible for the doors for the west portal, which bear the date 1186 and are far more ambitious in design than those by Barisano in the north portal. They are the largest bronze doors to survive from the Romanesque period—about 26 feet (7.8 meters) by 12 feet (3.7 meters)—and they contain an extensive iconographic program of illustrations from the Old and New Testaments.

White (1988) has demonstrated the importance of Bonanno's doors at Pisa and Monreale, with their clear, legible designs, for later developments in *Trecento* narrative art. They were an important source for Andrea Pisano in the design of the south doors of the Baptistry of the cathedral in Florence, which were commissioned in 1329 by the Calimala (wool importers) guild. The bronze doors of Romanesque Italy rank among the greatest artistic and technical achievements of the period.

Brunetto Latini

Brunetto (c. 1220-1294) was active in Florentine public life as a *notaio* (notary) or lawyer by 1254. In 1260, he was sent as ambassador by the Florentine commune to King Alfonso X el Sabio (the Wise) of Castile, with the aim of enlisting Alfonso—a Guelf—in the struggle against Manfred and the Ghibellines. Brunetto was returning from this embassy, according to his *Tesoretto* (verses 123-162), when he met at the Pass of Roncesvalles a student from Bologna who told him of the Guelfs' defeat at Montaperti (4 September 1260). Brunetto then spent six years of exile in France until the defeat and death of Manfred at Benevento (28 February 1266). During his exile Brunetto visited friars at Montpellier (*Tesoretto*, 2539-2545); wrote notarial letters at Paris (September 1263) and Bar-sur-Aube (April 1264); and composed his two most important didactical works: the prose *Livres dou trésor* (*Book of the Treasure*) in the Picardian dialect, and the verse *Tesoretto* (*Little Treasure*) in his native Tuscan. In France Brunetto also wrote his *Rettorica*, an Italian translation of and commentary on the first seventeen chapters of Cicero's *De inventione*. After returning to Florence, Brunetto held a series of important public offices and was frequently consulted by the Florentine government. He introduced the *stilus altus* (high style) of the imperial chancery into Florentine letters; he also continued his efforts toward public education by translating a

number of Ciceronian orations into Italian and composing his *Sommetta*, a collection of letters for teaching *ars dictaminis*. Brunetto was married and was the father of a daughter and two sons. He was buried at Santa Maria Maggiore, Florence.

In both *Trésor* and *Tesoretto*, Brunetto strove for a compendium of diverse technical information, but any closer association that he may have intended for these works remains unclear. Since he decided to write in the vernacular, both works are aimed at a secular readership, although in different ways: in *Trésor* he transposes Latin learning into a flourishing Romance koine for popular use, whereas *Tesoretto* fosters Italian as a *vulgaris illustris* (refined vernacular). Brunetto followed the example of the *Roman de la Rose* (c. 1225-1230) of Guillaume de Lorris—predating the continuation of the *Roman* by Jean de Meun (Jean Chopinel, Jean de Meung, c. 1269-1278) and beginning an interest in this great allegory of love that would absorb four or five generations of Italian poets. This early italianization of the *Roman de la Rose* proved to be rough going: the narrator of *Tesoretto* repeatedly interrupts himself to lament that its heptasyllabic couplets impose constrictions on his burgeoning material.

Tesoretto opens with an adulatory dedication to an anonymous *valente signore* (skillful lord), a man peerless in all the arts of peace and war, surpassing even the respective virtues of such figures as Solomon, Alexander, and Cicero. The narrative introduces the political turmoil that occasioned Brunetto's embassy to Alfonso the Wise; but then the student's calamitous news and his own exile cause his thoughts to turn inward, he loses his way in a forest, and the historic-biographical scene modulates into a visionary landscape. There his thoughts revive, and he observes the vast spectacle of Nature, a personification closely akin to figures in two other influential models for *Tesoretto*: Boethius's *Consolatio philosophiae* (*Consolation of Philosophy*) and Alanus de Insuii's *De planctu naturae* (*Lament of Nature*). Nature instructs Brunetto in the history and metaphysics of creation, in human psychology and physiognomy, and in astronomy and geography. Carrying Nature's *insegna* (banner) to guard against evil, Brunetto moves from cosmology to ethics: he proceeds to the court of the empress Virtue, who, with her four daughter-queens, is encircled by magnates and scholars. He overhears the practical advice—mostly

concerning interrelations of honor and finance—given to a knight by Larghezza (Largesse), Cortesia (Courtesy), and Prode-ffa (Prowess, who counsels the knight to hire a lawyer before opting to avenge a tort bodily). The narrator then decides to seek Fortune, parting from the knight and going to the right along a forking road to arrive at a fair meadow, the Kingdom of Love. There follows an excursus on the psychology of pleasure until the narrator, exasperatingly, falls subject to Cupid's power; suddenly, however, he sees Ovid, who teaches him self-mastery in matters of love. He next journeys to the friars at Montpellier, where *Tesoretto* closes on a note of penitent introspection and reopens (verse 2427) in the *modus dicendi* (style) of a personal letter. Now acutely conscious of the ambiguity of this world, and of its characteristically slippery language, Brunetto is disposed to ask his *fino amico caro* (dear friend): *Nonsai tu ke lo mondo/Si dovria dir "non mondo"?* (2457-2458, "Don't you know that the world/Itself should be called impure?"). The glorious personages invoked in the dedication are now seen to have been vanquished by death, and Brunetto's previous investment in fame is retracted through an exposition of the seven deadly sins, with pride foremost. Brunetto is then sufficiently penitent to take up his journey to the seven liberal arts, forgoing his search for Fortune. Finally he finds himself on Mount Olympus, where he meets Ptolemy; the poem breaks off (2944) just as Ptolemy is about to respond to a question on the interlinking of the four elements.

Tesoretto has recently been characterized as an Ovidian "art and remedy of fame"; be that as it may, Dante Alighieri evidently found Brunetto himself in need of therapy. The hunger for knowledge that inspired *Trésor* and impels Brunetto through *Tesoretto* informs—more or less directly—the controversial depiction in Canto 15 in Dante's *Inferno*, where Brunetto appears among the sodomites, bitterly cursing the Florentines for not overcoming their savage origins. Dante's Brunetto believes that the published treasure of his learning (*mio Tesoro*) can effect a kind of worldly immortality, and Dante honors him for teaching *come l'uom s'eterna* ("how man makes himself immortal," 85). However, it remains to be answered why Dante damned his Brunetto, his former teacher, to this part of hell. The grammar teacher as pederast was, often, little more than a common trope; thus critics have been skeptical about the idea that Dante was imputing

homosexuality to Brunetto—either they deny the notion (for which, in fact, there is no evidence) or they contextualize it, correctly identifying the medieval use of "sodomy" as connoting various forms of behavior, sexual or not, that signify violence done to nature. In this sense, Dante could also be implying that Brunetto betrayed his heritage by seeking renown through his French writings and thereby committing an unnatural act against his mother tongue (cf. *Convivio*, 1:10-13).

Tesoretto survives in sixteen manuscripts. Its influence, though considerable, was confined mostly to *Trecento* Italy. Boccaccio was sufficiently inspired by it to extend its general enterprise in his *Amorosa visione*, adapting French narrative models to Italian conditions for expressly didactic purposes.

Bruno of Segni

Bruno (c. 1040 or 1050-1123) was educated at the schools of Bologna, which were becoming increasingly important during his time. In 1079, he was sent to Rome for a synod on the eucharistic doctrine of Berengar of Tours. There, reportedly, Bruno's vigorous denunciation of Berengar carried the day and won him the friendship of Pope Gregory VII. That same year, Bruno was consecrated bishop of Segni.

Bruno traveled regularly in Gregory's entourage and was an outspoken supporter of the pope. In 1082, Bruno was briefly imprisoned by Count Aynulf of Segni, a partisan of Emperor Henry IV. Bruno later served actively under popes Victor III (r. 1086-1087) and Urban II (1088-1099), and he attended several councils, including Clermont (1095).

In 1103, Bruno entered the abbey of Monte Cassino; in 1107, despite his prolonged absences, he was elected its abbot. If Bruno saw this as a possible step toward the papacy, he was right: John of Gaeta, who had been a monk at Monte Cassino, became Pope Gelasius II (r. 1118-1119). However, Bruno himself, after vehemently criticizing Pope Paschal II (r. 1099—1118) for signing the Concordat of Sutri (1111), was forced to return to Segni, where he died.

The great number of Bruno's extant works, including homilies and scriptural and liturgical commentaries, testify amply to the high regard his contemporaries had for his skill as an exegete. His work is more innovative as political allegory than as theology, and it offers the historian valuable insights into the rhetorical battles of the reform movement.

There are no critical editions of Bruno's works, with the exception of one letter available in *Monumenta Germaniae Historica, Libelli de lite*; however, the manuscripts have been examined by Grégoire (1965).

Bruno's extant works are contained in *Patrologia Latina* (Vols. 164-165).

Buffalmacco, Bonamico

The fourteenth-century Tuscan painter Bonamico Buffalmacco was celebrated by fabulists for his great wit but remains one of the more obscure characters in the history of late medieval Italian art. Some scholars argue that Buffalmacco participated in the decoration of significant projects, including an important (and highly controversial) Pisan fresco, but little documentation has been unearthed that might either confirm or disconfirm his contribution to the visual arts.

What we know with certainty about this elusive figure can be summed up briefly. In archival sources, there are three references to a painter named Bonamicus. In 1320, he is mentioned as a member of

Giotto's workshop. He appears in a Pisan document in 1336, promising to return to a priest five gold florins paid as an advance on an unfinished altarpiece. In 1341, Bonamicus is named as the painter of a fresco (now damaged) in the bishop's chapel in the Duomo at Arezzo. Beyond these meager traces, nothing of substance can be said about the life or work of Bonamicus.

Thanks to the musings of Boccaccio, however, specialists in the trecento are confronted with a tantalizingly complete, although unsubstantiated, biography of this Bonamicus. A "Bo namico," with the surname Buffalmacco added, is featured in four stories in Boccaccio's *Decameron* (8:3, 6, 9 and 9:5). This character is presented as a clever, astute, and keenly observant painter, but easily distracted and more interested in playing pranks than in creating pictures. His foil in two stories is Calendrino, a halfwit who manages to endure both a stoning by Buffalmacco and the consumption of dog ginger dipped in sweetened aloe. There is absolutely nothing to suggest that Buffalmacco is anything more than a figment of Boccaccio's active imagination, just as there is no evidence to suggest that Calendrino (or Pampinea or Filomena, for that matter) was a living Florentine. Perhaps Boccaccio's Buffalmacco, whose name derives from the Italian word for humor or joke (*buffo*), is merely a stereotype of trecento painters.

Not surprisingly, however, Boccaccio's account caught the attention of later writers. Franco Sacchetti (c. 1330–1400) included Buffalmacco in novella 161 of his *Trecentonovelle*, where the painter again appears as a wisecracking savant; and both Ghiberti and Vasari worked strenuously to create a body of work for the man. More recently, some scholars have tried to reconstruct Buffalmacco's supposed career, using the three archival references to the mysterious Bonamicus as the basis for their conclusions.

Perhaps the most elaborate attempt to reconstruct Bufralmacco's career was Beilosi's (1974). Bellosi not only elevated Bonamicus to the status of a major master but also identified him as the painter responsible for the important fresco *Triumph of Death* in the Camposanto in Pisa. Although the archival entry of 1336 places Bonamicus in Pisa at a convenient, albeit early, time, Beilosi's theory is problematic, for there is no consensus on the date of the *Triumph of Death*: Longhi and Meiss believed the painting to have been executed

after the black death, but Bellosi (1974) and De Benedictis (1974) have argued that it was done before the plague. In either case, though, there is still no hard evidence that Buffalmacco was its painter, or even a real person.

In the end, all we can safely say is that Bonamicus Buffalmacco's biography and works are shrouded in mystery because of an irritating lack of documentation. We know so little about him that it is impossible to say anything more substantial.

Bulgars

Among the peoples of late antiquity called barbarians were the Bulgars, originally seminomadic Central Asians speaking a probably Turkic language. Many Bulgars moved into the eastern Danube provinces of the Roman empire in the late fifth century; some served with the Roman (early Byzantine) army, mostly as mounted troops, and some of these may have seen combat in Italy when it was being reconquered for the empire. Gregory the Great has a story in Book 4 of the *Dialogues* involving a Bulgar soldier on Narses's staff speaking the (exotic) Bulgar tongue in the city of Rome in the 550s or 560s. Paul the Deacon (c. 720-c. 799) tells us that Bulgars formed part of the ethnic

assortment brought into Italy by the Lombards in their migration of the late 560s and that the Bulgars had left their mark in the names of villages still in use in his own day. An organized group of Bulgars said to have been part of a large diaspora from the qaganate of Great Bulgaria to the northeast of the Black Sea entered Roman territory in the exarchate of Ravenna c. 660 and were settled in the Pentapolis. Not long afterward, a sizable Bulgar military force accompanied by the soldiers' families offered its services to the Lombard king Grimoald I. This force was sent to the duchy of Benevento, and its members were given lands in present-day Molise, where their leader, Alzec, became a local *gastald*. In Paul the Deacon's time their descendants still used their original language but also spoke Latin. Human graves dated c. 650-700 indicating practices associated with steppe culture (including horse burials) have been found in the part of Molise where these Bulgars are said to have settled; the graves may well document this element of the ethnic mix in early medieval Italy.

Also in the later seventh century, many Bulgars settled in the lower Danube region in areas still nominally Roman; the qaganate they formed there is the ancestor of modern Bulgaria. Over time they were assimilated into the general population and became Slavic-speakers. In contemporary sources, their Slavic descendants and successors are also called Bulgars; this usage of the term really specifies a region of origin. Eugenius Vulgarius, a Campanian poet and churchman of the late ninth and early tenth century whose culture was both Latin and Greek, may have had such Bulgarian antecedents. Most of the presumably Bulgar place-names attested to in medieval Italy do not appear in the records before the eleventh century, although the district in northern Lombardy called Bulgaria or Burgaria is a prominent exception. These place-names are now usually thought to reflect local Bulgarian settlements (known to have occurred at various times) or the presence of Bogomils (members of this originally Bulgarian sect were often called Bulgari) but not that of earlier, unslavicized Bulgars. Some too may have completely different etymologies unrelated either to Bulgars or to Bulgarians.

Buoncompagno Da Signa

Together with Bene da Firenze and Guido Faba, Buoncompagno (or Boncompagno, c. 1165-c. 1240) was among the leading representatives of the Bolognese school of the rhetorical *ars dictaminis* (art of prose composition) during its heyday in the thirteenth century, and of these three he was by far the most versatile and colorful. He was born in Signa, near Florence, sometime between 1165 and 1175. He began his studies in Florence and probably completed them in Bologna. By 1194, he had begun his career in Bologna as a teacher (*magister*) of rhetoric; eventually he became the preeminent doctor of that discipline, which served largely as a propaedeutic to the study of law. (At the time, law predominated in the university at Bologna.) After 1215, he worked in Venice, Reggio, and Padua; he returned to Bologna by 1235, but in 1240 we find him in Florence. The chronicler Salimbene of Parma also

reports that Buoncompagno tried, unsuccessfully, to obtain an appointment at the papal curia in Rome in 1240. Buoncompagno died, apparently in poverty, in the hospital of San Giovanni Evangelista in Florence.

Buoncompagno's writings centered on *ars dictaminis*, and his most influential work in this genre is the *Rhetorica antiqua*, or *Ancient Rhetoric*, also known as *Boncompagnus* (1215, revised 1226). This is primarily a vast collection of sample letters, arranged according to the social positions of writers and recipients, and covering a wide variety of situations from students' requests for money from home to correspondence with popes and emperors. It had been preceded by smaller works in the genre. *V tabule salutationum* (*Five Catalogs of Salutations*, c. 1194) gave a systematic overview of epistolary greetings, to which *X tabule* (*Ten Catalogs*) added instructions, now lost, for composing letters, privileges, orations, and wills. *Tractatus virtutum* (*Treatise on Virtues*, c. 1197) discussed virtues and vices of style. *Notule auree* (*Golden Notes*, c. 1197) provided suggestions for openings of letters, a subject revisited in *Breviloquium* (*Summary*, c. 1203). *Palma* (c. 1198) gave general rules for the main parts of a letter—salutation, narration, and petition—as well as for some secondary parts, such as the introduction (*exordium*), appeal for goodwill (*captatio benevolentiae*), and conclusion; it also discussed prose style. *Ysagoge* (1204) provided systematic instruction on salutations, the parts of the letter, and introductions. *Rota veneris* (before 1215) was a collection of sample exchanges of love letters, i.e., letters for initiating, maintaining, and ending amorous relationships; it thus was part of a tradition of *ars amatoria* exemplified by Ovid and Andreas Capellanus. In *Rota veneris*, Buoncompagno in effect constructed satirical (epistolary) *novellae*, anticipating aspects of the narrative art of Giovanni Boccaccio.

Buoncompagno's interest in prose composition extended beyond letters to various types of legal documents; thus he included within *ars dictaminis* elements of *ars notaria*, which received particular attention in the legally-oriented professional climate of Bologna. He published brief works on the writing of privileges and confirmations (*Oliva*, 1199), statutes (*Cedrus*, 1201), and wills (*Mirra*, after 1201).

While Buoncompagno's work reflects a general shift toward written composition in medieval rhetorical studies, he did not entirely neglect

the traditional focus of the discipline: oratory. His historical work on the siege of Ancona (c. 1172), *Liber de obsidione Ancone* (written between 1198 and 1200), echoes the rhetorical traditions of classical historiography both in its emphasis on the moral lessons of history (in this case the encouragement of the heroic defense of Italian liberties against a foreign oppressor) and in its inclusion of several orations during the course of the narrative. Moreover, Buoncompagno's second major treatise, *Rhetorica novissima* (1235), was devoted to training advocates in rhetoric for their oral pleadings; it represented an attempt (unsuccessful) to replace classical works such as Cicero's *De inventione* and *Rhetorica ad Herennium*, which continued to be used for such instruction in the Middle Ages. *Rhetorica novissima* also includes brief remarks on the conduct of negotiations and popular assemblies.

Rivalry with Cicero is also a theme of Buoncompagno's two philosophical tracts: *Liber de amicitia* (*Book of Friendship*, c. 1204) and *Libellus de malo senectutis et senii* (*Little Book on the Evils of Old Age and Decline*, c. 1240). In *Liber de amicitia*, Buoncompagno distinguishes twenty-six types of friends; since many of them are less than admirable, he is here undercutting more uplifting works such as Cicero's *De amicitia*. *Libellus de malo senectutis et senii*, Buoncompagno's pessimistic last work, is based on his sad experience of his own decline; here, then, he is undermining Cicero's paean to the blessings of old age, *De senectute*.

Many of the characteristics of Buoncompagno's writing that make it interesting to the modern reader—such as his lively flights of narrative fancy, his pervasive sense of irony and satire, his fondness for quirky digressions into obscure erudition, and his quarrelsome insistence on his originality—allow a strong individuality to emerge from his work. However, these same traits limited its practical impact in his own time, compared with the more mundane efforts of his less colorful contemporaries. Nevertheless, Buoncompagno's advocacy of a more direct and less artificial style of letter writing, in contrast to the classicizing and ornate approach favored by the Orléans school of *dictamen*, ultimately carried the day.

Buondelmonti Family

The Buondelmonti, an ancient Florentine noble family, first appear in records of the mid-eleventh century. In 1135, the Florentines destroyed the Buondelmonti's castle of Montebuoni in the Valdigueve, which had dominated the route to Siena. The family relocated to the city (see Dante, *Paradiso*, 16.66, 133-135), establishing a stronghold in Borgo Santi Apostoli. Members of the family served the imperial government of Frederick I Barbarossa in Tuscany, two as viscounts.

In February 1216, Buondelmonte de' Buondelmonti was murdered by Schiatta Uberti and Oddo Arrighi, after an insult at a banquet and a subsequent breaking of a betrothal; this killing set off a full-scale feud between the Uberti and the Buondelmonti. The Uberti and their followers, who supported the empire, took the name Ghibellines; the Buondelmonti and their followers, who supported the papacy, took the name Guelfs. (According to a chronicler, this was "the first time the new names were heard.") The resulting family feud lasted well into the fourteenth century.

In 1247, the Buondelmonti led the Guelfs' resistance to the imposition of Frederick of Antioch as Tuscan vicar-general by his father Frederick II. Their effort failed, and, along with other Guelfs, they fled the city. The Scolari branch of the family remained loyal to the emperors and went into permanent exile after the battle of Benevento (1266). Other Buondelmonti established strong ties with the Angevin court of Naples; the Florentine merchant Manente, for instance, married the sister of the seneschal Niccolò Acciaiuoli and became a royal chamberlain. Though the family was banned from office by the Ordinances of Justice of 1293, many Buondelmonti served in office and on missions, including Benghi (d. 1381), who married the daughter of the Alberti count of Certaldo. Benghi held important military captaincies and was also the *podestà* (city magistrate) of Prato. He was exiled during the Ciompi tumult of 1378 as a member of the Guelf ruling oligarchy. At this time, other Buondelmonti changed their name to Montebuoni.

Byzantine Empire

Byzantium is too readily dismissed as the "eastern empire" or even the "Greek empire"—something alien to Europe and the Christian Middle Ages. In fact, however, Byzantium was no more and no less than a direct and uninterrupted medieval continuation of the Roman empire. The capital of Byzantium was the great metropolis of Constantinople; and the Byzantine empire evolved with its focus on the eastern Mediterranean, following the loss of the western provinces to various Germanic regimes in the fifth century and the detachment of the southeastern lands by the Arab conquests of the seventh century. Its recovery, and its predominance, reached a pinnacle by the eleventh century; but soon thereafter Byzantium fell into internal decay, accelerated by pressures from the stirrings of western Europe (culminating in the disastrous Fourth Crusade) and the menace of new Turkish regimes (Seljuk and Ottoman). Nevertheless, Byzantium continued to survive, evolve, and flourish even as it declined, until the Ottoman conquest of Constantinople in 1453.

As the western Roman court crumbled during the fifth century, the government in Constantinople maintained an interest in Italy, sending what help or intervention it could. Emperor Zeno (r. 474-491) apparently encouraged the remarkable German ruler Theodoric the Ostrogoth to invade Italy and destroy the regime of Odovacar, but during Theodoric's later years his relations with Constantinople deteriorated. After Theodoric died, Emperor Justinian pursued the recovery of Italy in his own Gothic wars (535-553), at first with the brilliant general Belisarius as his commander. Imperial government had barely been restored, under Narses, when much of Italy was overrun by the Lombards. In the ensuing stalemate, imperial power was preserved

mainly in the south—in Campania, Lucania, Apulia, and Calabria. In the north, all that remained was the enclave around Ravenna, which became Italy's imperial capital, under the regime of the exarchate, and would remain the capital until the resurgent Lombards took it in 751. In 663, Emperor Constans II (r. 641-668) personally led campaigns against the Lombards; then, for the last years of his life, he established his residence and court at Syracuse in Sicily. By the end of the seventh century, the southern Italian regions were reorganized as *themes*, or military provinces.

By the eighth century, the religious policies of Iconoclasm promulgated by the sovereigns at Constantinople had alienated their Italian subjects; and in any case the Italians felt little loyalty toward overlords who expected obedience and revenues but were unable to provide any help against the Lombards. Emperor Leo III (r. 717–741) punished the Roman popes by transferring their jurisdiction over the territories of Sicily, southern Italy, and Illyricum in the Balkans to the patriarchate of Constantinople. Disillusioned with subjection to Constantinople, the popes of the latter eighth century placed themselves instead under the protection of the Franks. This epochal realignment of power in the west culminated in the powerfully symbolic coronation of Charlemagne as emperor of the Romans in 800—a title that the Byzantine court bitterly contested.

The ninth century brought a new blow to the tenuous Byzantine presence in Italy: the Arabs' seizure and conquest of Sicily, actually a process that went on throughout the century. From this new and independent corsair regime, the Arabs' raids gravely menaced not only Byzantine territories on the mainland but the survival of Christian rule in Italy; indeed, for a brief period an Arab emirate was established in Bari. Nevertheless, during the latter ninth century, especially under Basil I (r. 867-886) and his successors in the new Macedonian dynasty, the Byzantines improved their situation in Italy in a number of ways. The resourceful patriarch Photios brilliantly beat off the efforts of Pope Nicholas I to intervene in the Constantinopolitan church and reclaim the lost ecclesiastical provinces. Following Nicholas's failure, the papacy declined to its notorious era of degradation (the "black night"). Above all, new assertions of power in the Adriatic and in southern Italy restored Byzantine control in these areas, where the Greek culture and

population were already being reinforced by refugees from Iconoclasm and from Sicily. As a result, southern Italy was effectively reincorporated into the Byzantine world, and its administrative *themes* were eventually placed under a single commander (the *katepan*) whose headquarters were in Bari. Religious and cultural life in southern Italy became strongly oriented toward Constantinople, and Italian scholars, churchmen, and monks regularly journeyed to and from eastern Byzantine regions.

Byzantine control weakened once again during the tenth century, however. Remnants of old Lombard principalities, cities around Naples and beyond (under various princely or republican regimes), and regional grandees—many of them theoretically dependents of Byzantium—pursued their own independent, often conflicting and dissident, policies, although there were periodic alliances against the Arab menace, and some of these alliances included the papacy. That menace continued for some time, but by the early eleventh century the Arab regime had been weakened and was in retreat from the stirring Christian power in the western Mediterranean. A new era was promised by the stern military emperor Basil II (r. 976-1025), who brought Byzantium to its zenith as the preeminent power of the western world in general. After successes elsewhere, Basil II planned the reconquest of Sicily; in preparation for this, he sent the able commander Basil Boioannes to restore firm control on the mainland. Boioannes defeated the local rebel Melo, paving the way for the formidable emperor to reach his goal; but then Basil II died. Sicily remained in Arab hands, and Byzantine control again seemed about to unravel amid local revolts and dissent from indigenous groups who were not always assimilated into Greek culture.

During this unstable period, the first Normans began to trickle into the territory as mercenaries. From c. 1020 onward, as circumstances allowed, they served local regimes, dissidents, and even imperial commanders. After the death of Basil II, the court in Constantinople slipped into corruption and general incompetence, and the Italian policies of Byzantium became even more muddled. In 1038, an effort was made to renew the Sicilian reconquest that Basil II had been unable to complete; this project was entrusted to the brilliant general George Maniakes, whose forces included Byzantium's Varangian Guard.

(Among them was the formidable Norse warrior Harald Haardraade, who, however, fell out with the commander and left the campaign.) Maniakes made a good beginning, landing in Sicily and taking its eastern coast, including Messina and Syracuse. But intrigues against him at court resulted in his recall to Constantinople and his imprisonment there. He was given a second chance in 1042, when his target was the depredatory Normans. Once again, however, there were intrigues against Maniakes in the corrupt capital, and, exasperated, he proclaimed himself emperor, led his troops out of Italy, and took the road to Constantinople. Along the way, in 1043, he was killed in an unexpected battle.

Maniakes's death left a vacuum in southern Italy, but this was filled by rebels and by Norman freebooters, whose presence became increasingly disruptive. Melo's son, Argyrus, attempting a new

rebellion against the Byzantines, found his movement taken over by these ambitious warriors, and he fled to Constantinople. There he became an intermediary in negotiating an alliance of convenience between the Byzantine court and the new reformist pope, Leo IX. Though the two parties shared an opposition to the Normans, the alliance soon foundered over clashes of court and ecclesiastical interests; in 1053, all hope of halting the Normans' progress was dashed when the Normans defeated and captured the pope at Civitate. Reluctantly, the papacy condoned the Normans' conquest of Byzantine southern Italy and of Saracen Sicily, legalizing the invaders' status and in effect making them the awkward new champions of Roman Christianity against both Orthodox Christianity and Islam.

The ambitious Hautville chieftain Robert Guiscard, as duke of Apulia, assumed paramount leadership of the Normans against all opposition. He completed his triumph over Byzantium by taking the empire's last toehold, the port city of Bari, in 1071. Robert thereafter assisted his younger brother, Count Roger I, in a successful conquest of Arab Sicily (1060-1091). As a result of the creation of powerful new Norman regimes by the end of the eleventh century, southern Italy was no longer a Byzantine satellite but became a menace to the empire. Robert Guiscard, who craved control of both sides of the Adriatic, undertook a daring assault on the Byzantine Balkans in the last four years of his life; he nearly succeeded, but he was distracted by an obligation to recover Rome for Pope Gregory VII (1083), and then he died (1085). Robert's ambitions in the east were to be the heritage of his son Bohemond, who became a thorn in Byzantium's side: Bohemond was involved in the First Crusade, and then in a Norman attack of his own in the Balkans in 1107. The direct Norman menace abated under Robert Guiscard's heirs in Apulia, but it was redefined when Roger II melded his Sicilian realm with the Norman territories on the mainland, creating a formidable new kingdom by 1130. Roger's threat to the empire reached a height in 1147, when, taking advantage of the international confusion caused by the Second Crusade, he launched a devastating maritime raid on areas of Greece, carrying off to Sicily literally the entire Byzantine silk industry—workers, technology, tools, and all.

Byzantium meanwhile faced another threat in Italy, from the enterprising mercantile republics. Merchants of Bari and Amalfi were

subjects of the empire and had special trading opportunities within the tightly controlled Byzantine economy. But Venice, long prosperous as a Byzantine dependency, achieved considerable strength as the dominant naval power in the Adriatic, so much so that by the eleventh century—a pivotal period—it could deal with Byzantium as an ally of almost equal status. Emperor Alexius 1 Comnenus (Alexios I Komnenos, r. 1081-1118), fighting off Robert Guiscard's invasion, obtained the aid of the Venetian navy in exchange for granting Venice sweeping exemptions from Byzantine tariffs and trade control in the empire (1082). Alexius's successor, John II (r. 1118-1143), tried but failed to nullify these concessions; he then resorted to a policy of playing the Venetians off against their mercantile rivals from Genoa and Pisa. In the process, Byzantium's lucrative commerce was largely taken over by the Italian entrepreneurs.

Whether or not the Byzantine emperors after 1071 had any intention of recovering territory in Italy, such a policy was recklessly undertaken by the third Comnenian sovereign, Manuel I (r. 1143-1180), who was perhaps influenced by the memory of Justinian. Manuel professed to support the Italian cities and the pope against the German emperor Frederick I Barbarossa, and actually sent an expeditionary force in 1155. That force seized from the Norman realm the entire coast of Apulia from Taranto to Ancona; but in 1156 the Norman king William I (r. 1154-1166) recovered these territories, revealing the weakness of Byzantium's reach. Manuel attempted further intrusions into Italy, in the form of diplomatic schemes, but the upshot was his total humiliation, as all the other parties in Italy resolved their quarrels with no reference to him. Moreover, his dramatic expulsion of the Venetians from the empire in 1171 deepened the hostility of Venice toward Byzantium. The collapse of the Comnenian regime brought a massacre of other Italians in Constantinople by a Byzantine mob in 1183. Two years later, the massacre was used to justify a Balkan expedition of the Norman king William II (r. 1166-1189); William's force collapsed, but not before it had subjected Thessaloniki to a savage storming and a horrific occupation. The new regime of the Angelan dynasty was incompetent and corrupt; it cowered before the threats of the German emperors Frederick I and then Henry VI while internal decay mounted and Byzantium became more and more discredited and vulnerable

internationally. The climax came in 1203-1204, when a complex mixture of circumstances and personalities—above all, the formidable Venetian doge Enrico Dandolo—prompted the forces of the Fourth Crusade to intervene in an Angelan dynastic quarrel and then take Constantinople by storm. From its share of this conquest, Venice was able to build a vast new maritime empire that gave it a significant advantage in its commercial rivalries.

But Byzantine society and culture, far from being degenerate or moribund, proved resilient and survived the shattering blow of 1204, if tenaciously, in the form of several splinter states. The most effective of these states was based in Nicaea. One of its rulers, John III Vatatzes (1222-1254), cultivated a diplomatic friendship with the Hohenstaufen sovereign Frederick II and married one of Frederick's daughters. Eventually, in 1261, the Nicaean government was able to recover Constantinople from the decrepit Latin regime there. The emperor of the restoration, Michael VIII Palaeologus (1259-1282), faced the menace of Charles of Anjou, the powerful successor to the Hohenstaufen in the Norman realm. To obtain support against Charles, Michael pursued a disastrous policy of promising the popes to unite the Byzantine church with that of Rome. Michael played one last Byzantine game of grand diplomacy by throwing his influence, and his gold, into an alliance with Aragon that brought about the smashing of Charles's power in an episode called the Sicilian Vespers (1282).

Byzantine's restored empire lasted 170 years more, during which its culture and art thrived and were a powerful influence. But these years saw the empire itself reduced to a pathetic regional power. Italian and other princes with hereditary claims to Byzantine lands had to be bought off in various ways, while the spiraling rivalry between Venice and Genoa diverted virtually all Byzantine commercial traffic and left Constantinople continually caught in the middle of their recurrent wars. Two reigning emperors (John V in 1360-1370, and his son Manuel II in 1400-1402) included Italy when they visited western regions to seek aid against the Turkish threat. It was, however, the birth of humanism in the mid-fourteenth century that opened the way for a final connection between Byzantium and Italy. From the late fourteenth century onward, emigré Byzantine scholars brought their learning and resources to Italian intellectual centers, making classical Greece—its

language, authors, texts, and philological traditions—once again accessible in the west, and a major contribution to the Renaissance.

C

Caccia

The *caccia* is a poetic form with no fixed meter or structure. It is perhaps better known as a musical form that originated in thirteenth-century France and spread to Italy in the first half of the *Trecento*. Because the poetic *caccia* uses a wide variety of meters, lively dialogue, and onomatopoeia, some scholars have associated it with the *frottola*, which was also often set to music.

Traditionally, the term *caccia* has two meanings, indicating distinct theories of its origin. According to musicologists, *caccia* was synonymous with "canon," the staggered iteration of voices which could be described as a polyphonic "chase." According to this definition, the *caccia* is primarily a musical form. There are only twenty-six Italian *cacce* in existence—very few, in comparison with other poetic and musical forms. This small number of extant *cacce* might be attributable to the difficulty of composing and performing in the canon form.

In contrast to the musicologists, the nineteenth-century poet and scholar Giosuè Carducci believed that the origins of the *caccia* were primarily literary. He attributed the term to the prominence of venery as subject matter in *cacce*, which treated the theme of amorous pursuit metaphorically. Indeed, the fourteenth-century Italian *caccia* vividly depicts either a "hunt" or a busding social scene; for example, in the *cacce* of Franco Sacchetti women pick flowers in a meadow (*Passando con pensierper un boschetto*) and bathe in a river (*State su, donne*), and gregarious men are about to engage in chivalric sport (*A prender la battaglia giuso al piano*). Carducci also believed that the Florentine Niccolò Soldanieri had probably been the first Italian to compose poetic *cacce* (*A poste messe, Chi caccia e chi è cacciato, Per un boschetto fra pungenti spine*), one of which (*A poste messe*) was set to music by Niccolò del Proposto. Carducci's conclusions were based on stylistic aspects of these three *cacce* and on the fact that Soldanieri represented

exclusively hunting scenes.

The musicologists, William T. Marrocco and Nino Pirrotta, however, rejected Carducci's philological argument for the *caccia's* literary origin. Marrocco dismissed the issue of subject matter, saying that "a poem ... is a *caccia* only when it is set to the musical device of canon. Contrarily, a hunting episode does not necessarily imply a musical setting in canon form" (1961, xi). Pirrotta observed that the fundamental attributes of the poetic form were determined almost entirely by the polyphonic compositions to which the poems were set (1946, 308). Still, neither Marrocco nor Pirrotta excluded the possibility that the *caccia* was an autonomous poetic form. In this regard, Brasolin (1985) made a taxonomical study of the poetic *caccia*. She found a correlation between the grouping of verses in two or more stanzas and the length of verses. Today, musicologists and philologists emphasize the relation between the canon form and the poetic features of the *caccia*, viewing the *caccia* as an instance of *poesia per musica*.

Whatever its origin and development, the *caccia* gained great favor among the virtuoso composers and performers of *ars nova*. We can perhaps attribute the popularity of the poetic *caccia* among musicians and the public during the *Trecento* to its fluid, adaptable rhythm and to its mimetic representation of joyous social interaction, which accorded with the conviviality of aristocratic-minded audiences.

Caetani Family

The first record of the Caetani in Rome is found toward the end of the eleventh century, but at that time the family played a more important role in the small city of Anagni in southern Latium. The house of the Caetani owed its rise among the baronial nobility of Rome to its first cardinal, Benedetto (d. 1303), who became Pope Boniface VIII in 1294. He and his family immediately exploited his new office and used political marriages to enlarge their territories and interests in areas south of Rome and in southern Tuscany (Campagna, Marittima). Through their systematic purchases of castles, the Caetani soon became the most powerful lords in these areas. The centers of their control were Anagni and Sermoneta. Pope Boniface also induced the king of Naples to transfer fortresses and earldoms in his kingdom in fief to the pope's great-nephews. Moreover, members of the Caetani family were made cardinals and were given important posts in the state administration of the church. The expansion of the Caetani in Latium came primarily at the expense of the local and Roman nobility.

The bitterest enemies of the pope's relatives were the Colonna, against whom Boniface VIII began a remorseless campaign in 1297. The Colonna, driven into exile, conspired with King Philip IV of France (Philip the Fair), who had himself been provoked to oppose the pope because of Boniface's abuses of power. With the support of Sciarra Colonna and other local nobles, the French emissary Guillaume de Nogaret arrested the pope in Anagni (Boniface's native city) on 7 September 1303 and held him for three days; this episode is known as the "humiliation of Anagni." Although the pope was soon released, the incident left him a broken man, and he died on 11 October. After

Boniface's death, the Caetani had to defend themselves against their enemies in several armed encounters; and not until King Robert of Naples offered mediation in 1329 could their hostilities with the Colonna be settled.

In the following decades, however, it was internal conflict that weakened the Caetani family, which was now divided into four main lines. During the second half of the fourteenth century, a prominent member of the family was the earl of Fondi, Onorato I (d. 1400). Onorato had been a foe of the Avignonese popes, but he then became a friend first of Gregory IX and then of Clement VII (who had been elected in Fondi), in opposition to Urban VI. As a partisan of the antipope, Onorato became one of the chief instigators of the Great Schism of the west. Without him, Clement VII would have lost southern Latium—the vantage point from which Clement his followers were always able to threaten Rome. Only shortly before his death did Onorato once again become obedient to Rome. Antonio (d. 1412), the son of Onorato's brother and heir, Giacomo (died c. 1423), was made a cardinal by Boniface IX.

Caffaro Family

The Caffaro, a family of viscounts, took their name from their region of feudal possession in Val Polcevera, a mountain valley northwest of Genoa, dotted with small parish churches, protective castles, farms, villas, groves, and vineyards. The Caffaro family was prominent in the early Genoese republic; its members included elected consuls, merchants, feudal lords, ambassadors, and military captains, and they participated in commercial conquests of the Saracens and Pisans in the Mediterranean and in crusades to the Holy Land.

The most famous member of the family was Andrea Caffaro (Caffaro di Caschifellone, c. 1080 or 1081-1166), the son of Rustico di Caschifellone (Castrofino). Andrea began a long, illustrious line of secular chroniclers who wrote in Genoese Latin and then in the vernacular; these were the first official Italian chroniclers, recording (and thus helping to define) major public entities in the early communes. The late medieval chronicle tradition marked the beginning of early modern civic life, anticipating the civic humanist traditions of written communal history in the Renaissance.

A distinction is sometimes drawn between chronicles and histories, but Andrea's annals might be called "chronicle history" because of their thematic focus on the crusades and related public events shaping the civic experience in the late Middle Ages, Andrea proceeds in chronicle form, year by year (though with many gaps), beginning with the First Crusade to Jerusalem and Caesarea in 1099-1101 and ending in 1163, shortly before his own death. Whether the chronicle was dictated or actually written by Andrea, its narrative voice suggests a remembrance of things past, and some events are recounted in vivid detail, indicating that the author was a direct participant rather than a passive observer. Thus, the life of this civic chronicler is closely interwoven with his narrative.

At age twenty, Andrea embarked with other Genoese on the First Crusade; this was a defining moment for his career and his annals. He probably witnessed the crowning of Baldwin I as king of Jerusalem and took part in the Christian crusaders' worship of the relics at the Holy Sepulchre—a touchstone for the competing European kingdoms, the

Italian commercial city-states, and their Mediterranean empires. Andrea fought under the command of Guglielmo Embriaco in the successful siege of Caesarea by the Genoese in 1101, a campaign that began a long process—recorded meticulously in his annals—of carving out trade colonies and taking sacred and temporal spoils from the Byzantine empire and the Islamic kingdoms. Genoa vied fiercely with Pisa and Venice for the lucrative silk and spice trade routes connecting medieval Europe to the advanced global economies of China, southeast Asia, and central Asia. This youthful experience was significant for Andrea, serving as the inspiration for his chronicle and the first event recorded in it. Furthermore, the First Crusade began a tradition of private communal contracts (*compagna communis*) between territorial family trading associations in Genoa, a fact that underscores the fourfold purpose of Andrea's account; patriotic, sacred,, commercial, and communal.

During the next two decades, Andrea pursued his education, and his fortune as a merchant in the Mediterranean trade, before beginning his political career as ambassador to the papal court of Calixtus II in Rome in 1121 and 1123. At the papal court he argued for—and won, partly through bribery—Genoa's elevation to an archbishopric, in rivalry with Pisa for supremacy over Corsica. Andrea pursued this alliance between the church and the early commune as *console del comune e dei placid* (consul of the commune and neighborhoods of Genoa) in 1122. That office was the first of his eight consulships (the others were in 1125, 1127, 1130, 1141, 1144, 1146, and 1149) and is an indication of his political stature. During this period he also held naval commands and had ambassadorial duties and financial responsibilities, participating in fighting the Saracens and Pisans in the Tyrrhenian Sea and forging critical alliances with the courts of Castile, Aragon, and Rome.

Andrew wrote two minor works in the 1150s: one was a retrospective account of Genoa's role in the First Crusade (by then half a century in the past); the other was on the recent capture of Aleria and Tortosa from the Muslims in Spain. He was sent on two final embassies to Frederick I Barbarossa, in 1154 and 1158, shortly before he retired from public life. He presented his *Annali* to the Grand Council of the Republic in 1163. Ironically, this first major chronicle history, celebrating the formation of public life in the consular republic, ended

at a point of political crisis and family factionalism. No other member of the Caffaro family ever achieved the prominence of Genoa's first historian.

Calixtus II, Pope

Pope Calixtus II (Guido di Borgogne, d. 1124, r. 1119-1124) was a

powerful member of the high aristocracy and distantly related to the Salian house, a German royal dynasty. His brother, Hugh III, was archbishop of Besançon. Their father, Count William of Burgundy, was a faithful vassal of Emperor Henry IV. Even after Henry was excommunicated by Pope Gregory VII in 1076 and was being widely shunned, William received and entertained the king over the Christmas holidays, providing him with servants for his winter journey across the Alps.

Guido was elected to the archbishopric of Vienne in 1088. He did not hesitate to resort to forged documents in order to obtain primacy for Vienne in its rivalry with the see of Arles. He also had dynastic ambitions in Burgundy, on behalf of his family; these ambitions were at least partly responsible for his clashes with Emperor Henry V, and indirectly with Pope Paschal II (1099-1118), after the turn of the twelfth century (Stroll 1980). As papal legate Guido conducted a synod at Vienne in 1112 that protested against the lay "investiture privilege" of April 1111, extorted by Henry V from the imprisoned Paschal II, and excommunicated Henry. In a letter informing Paschal II of the synod's decisions, Guido threatened the secession of the French church unless Paschal accepted those decisions as binding and confirmed them explicitly. After the death of Pope Gelasius II (1118-1119) at the abbey of Cluny, the cardinals present elected Guido as his successor, and Guido took Calixtus (or Callistus) II as his papal name.

As pope, Calixtus changed his policy toward the emperor. He sought contacts with Henry; but the negotiations over investiture at Mouzon in 1119 collapsed, primarily because of semantic problems and mistrust between the parties, leading to another excommunication of Henry by the synod of Reims (October 1119). Calixtus gained entry into Rome in 1120 and defeated the antipope Gregory VIII a year later. Renewed attempts to mend the schism created by the struggle over investiture ended successfully with agreements exchanged between Henry V and the papal legates at Worms on 23 September 1122. The Concordat of Worms, as the agreements later came to be known, was reluctantly ratified by the Lateran Council of 1123. These agreements were brief charters embodying concessions and assurances by each party to the other. Henry renounced the investiture of bishops with ring and crozier, thus permitting canonical election and consecration. The pope, in turn,

conceded to German bishoprics and abbeys elections in the presence of the king or his representatives. Moreover, the king was to have the right to intervene in disputed elections, and—most important—he could invest candidates for German sees before consecration with the *regalia* (a term that was left undefined but generally meant secular rights and properties), using the scepter instead of the ring and crosier. In Burgundy, which was at least nominally under imperial suzerainty, and in imperial Italy, *regalia* were to be transferred to the prelates after consecration. In Germany, therefore, Henry certainly retained some rights regarding elections. The Concordat of Worms was very close to the conditions of agreements made with England and France during the pontificate of Paschal II, and it agreed even more precisely with the better-documented negotiations between Henry V and Paschal II in the winter and early spring of 1111. As pope, therefore, Calixtus II continued the policies of Paschal II. It had become evident that the Roman church could no longer revoke the recognition, given at Sutri in February 1111, of royal rights to the *regalia*, even when those were in the hands of the church as ecclesiastical temporalities.

Caltabellotta, Treaty of

The treaty of Caltabellotta of 29 August 1302 was negotiated in Sicily by Charles of Valois between Frederick of Aragon, the ruler of Sicily, and Robert of Anjou, the vicar (later king) of the Regno. It established peace between Charles II of Naples, Pope Boniface VIII in his capacity as overlord of the Regno, and Frederick of Aragon. Frederick was recognized as "king of the island of Sicily" for life, but on his death the island was to revert to the Angevins and Frederick's descendants were to be compensated with the kingdoms of Sardinia and Cyprus. In addition, Frederick was to marry Charles's daughter Eleanor. Boniface, who had subsidized the Angevins against the Aragonese, disliked the treaty—he saw it as dismembering the Regno—but in 1303 his problems with the king of France forced him to ratify it, with the modification that Frederick was to be known as "king of Trinacria" while Charles II retained the title "king of Sicily."

After the peace of Anagni of 1295, which ended the involvement of France and Aragon in the war, James II of Aragon had taken the Angevin side against Frederick. James now ratified the peace, and his son Sancio married Charles II's daughter while his daughter married Charles II's son Robert.

Although the treaty concluded at Caltabellotta would be broken when Frederick died in 1312, it briefly established a much needed peace in the south, and its provisions were not substantially altered by subsequent fighting until the fifteenth century.

Camaldoli

Camaldoli is a hermitage established in the early eleventh century by Saint Romuald (Romualdo, c. 950-1027); it is situated approximately 50 miles (80 kilometers) east of Florence, and high in the remote Tuscan Apennines in the Casentino national forest. Camaldoli became the original house of the Camoldolese Benedictines, an ascetic order.

Romualdo's biographer, Peter Damian (1007-1072), one of the later abbots of the hermitage, chronicled the saint's words and actions rather than merely cataloging his miracles. According to Damian, Romualdo was converted to a hermit's life when his father was involved in a bloody duel and Romualdo retired to a monastery to do penance for his father's sin.

The early history of Camaldoli is inextricably linked to the monastic reform radiating from Cluny and to a shift in emphasis, both within and outside the Benedictine movement, away from the fully communal monastic life and toward a more individualized monastic piety. The architecture of the hermitage, which originally consisted of five separate cells and a church, reflects the tension inherent in this newer monastic ideal. The new concept—whose most eloquent spokesman was Peter Damian—involved not only a more individualized monasticism but also a strict emphasis on poverty; accordingly, the founders were determined to refuse the customary gifts and benefactions. The first rules of the order, drawn up in 1080 by the hermitage's fourth prior,

Rodolfo, emphasized contemplative solitude as the individual's path to God but also portrayed the solitary life as a necessary preparation for life in a monastic community. Thus not only did Camaldolese hermitages represent the origins of medieval monastic individualism, but in initially refusing gifts and benefactions they also reflected power struggles on a larger institutional and geographic scale: i.e., a conflict between lay patronage and ecclesiastical independence. In 1113, the papal bull that established the congregation noted the existence of three hermitages and twenty-five other monastic institutions, including a convent for nuns near Florence. In the mid-twelfth century, severe conflict broke out—internally, over the relative importance of eremitic (individual) and cenobitic (communal) monasticism; and externally, over the issue of the hermitage's independence from both secular and ecclesiastical potentates.

By c. 1250, Camaldoli had more than 300 monks and administrators. As the power of the Guidi counts fragmented and declined, the monastery reclaimed much of the land that it had lost in earlier political struggles. Although the activities of the monastery are somewhat sparsely documented, it had an extensive reach in the fourteenth and fifteenth centuries as a landholding institution, and this has provided valuable evidence about landholding patterns and relationships between monastic landlords and their rural tenants in the later Middle Ages. From the early fourteenth century to 1500, the number of farms administered by the monastery more than tripled. Moreover, these farms covered such a wide area that the monastery had to employ several middlemen, or factors, to oversee the buying and selling of grain, wine, and wood. By the fourteenth and fifteenth centuries, sheep herding and cattle raising were typical activities of the monastery in the Casentino during the summer, and during the winter the cattle were brought to pastures in the Maremma on Tuscany's coast, a hundred miles to the west, to escape the snow.

Among the more notable monks of Camaldoli were the canonist Gratian (fl. 1140), the painter Lorenzo Monaco (1375-1420), and the humanist Ambrogio Traversari (1386-1439). Fittingly, Cristoforo Landino's dialogue *Disputationes Camaldulensis* (late fifteenth century), modeled after Cicero's *Tusculan disputations* on the active and contemplative life, conveyed both the setting and the name of an

institution that for nearly half a millenium had fused radical individualism, voluntary poverty, active life within a community, and the contemplative ideal of the desire for God.

Camaldoli was also the name Florentines gave to districts of silk and wool workers near the parishes of San Frediano and the Carmine on the south bank of the Arno. In the fifteenth century small clusters of immigrant workers, especially from German-speaking areas, lived there and worked in the cloth industry.

Camerino, Duchy of

The ancient city of Camerinum (in the modern region of the Marches) became allied with Rome in 310 B.C. and was an important center in Roman Umbria. According to tradition, it was besieged by Alaric in a.d. 409. After the period of Ostrogothic rule, it became part of the exarchate of Ravenna in 553. It was seized by the Lombards in 592 and became the seat of a duchy. Under Charlemagne it was a regional capital of the March of Camerino. By the time of Innocent III it became subject to the Roman church but retained its autonomy. A commune developed in this period and had its own coinage. Camerino, which was strongly Guelr, resisted attacks by Frederick II and King Enzo, but in 1259 Manfred ordered its destruction. The city was reconstituted and rebuilt by Gentile da Varano, who was acclaimed as its founder and recognized as its lord by Pope Alexander IV. Gentile initiated the *signoria* of the da Varano family, which lasted for almost three centuries, with only a short interruption by the Sforza family (1434-1444), until 1545, when Camerino definitively became a part of papal territory. There were extensive construction projects during the regime of the da Varano family, but very little of these projects survives. The church of Saint Francis, built in the thirteenth century, was substantially altered in subsequent periods.

Campaldino, Battle of

On 11 June 1289, a Florentine Guelf army defeated a Ghibelline force from Arezzo on the plain of Campaldino near Poppi in the Casentino. Aiding the Florentines were other Guelf communes, including Bologna, Siena, and Pistoia. The battle was an important episode in a series of wars fought sporadically from 1288 to 1292 between Florence and its Ghibelline rivals, Pisa and Arezzo. The Florentines' victory at Campaldino was the dramatic end of a short war against Arezzo. It helped consolidate the Guelf regime in Florence, protected vital commercial and military arteries to the Romagna and the lower Arno valley, and edged Florence closer to regional hegemony in Tuscany. The war was unpopular among many Florentines. Indeed, in 1293, its memory helped generate a political backlash against the nobles (or magnates) who were leaders in the war against Arezzo.

In 1287, Ghibellines in Arezzo expelled the Guelts, who quickly found sympathy from their counterparts in Florence. In 1288 an Aretine force, allied with Florentine Ghibelline exiles and encouraged by the imperial vicar at San Miniato al Tedesco, apparently began to raid Florentine territory along the Arno. The decision to make war against Arezzo was not unanimous, especially among lesser guildsmen. Nevertheless, encouraged by the Parte Guelfa (the Guelf party organization), the commune decided to send an army of about 10,000 infantry and 2,000 cavalry through the Consuma Pass in the Apennines to attack Arezzo from the north. Both Villani (c. 1275-1348) and Compagni (c. 1255-1324) offered accounts of the ensuing battle.

The Florentines were victorious for several reasons: their numerical superiority, their ability to choose favorable terrain, and their superior strategy. A Pistoiese reserve force attacked the Aretines from the flank to end the battle. The commander of that reserve was the fiery Florentine Corso Donati, the future leader of the Florentine Black Guefs. Scholars disagree about whether Dante Alighieri was present at Campaldino; however, there is a specific reference to the battle in *Purgatorio* 5 (91-93).

Campione, Bonino Da

The sculptors of Lombardy from the *Duecento* through the *Trecento*, who are often referred to as the *Carnpionesi*, worked primarily in stone, in a style generally characterized by compactness, simplicity of form, and directness of expression, sometimes enlivened by a narrative richness. Only one member of the group, Bonino da Campione (d. 1397), has an identifiable artistic personality; but this is based less on two signed works—the tomb (of rather mediocre carving) of Folchino degli Schizzi (d. 1357) in Cremona and the monument of Cansignorio della Scala (d. 1375) in Verona—than on a series of anonymous works that are idiosyncratic yet appealing. In 1388 Bonino was consulted regarding work on the *duomo* of Milan, and he apparently died in March 1397. Given these few facts, many carvings and at least one other major sepulchre, the monument of Bernabò Visconti (d. 1385), have been attributed to Bonino. There have been tortuous attempts to encompass within a single artistic personality the vastly different stylistic characteristics of these works: the rigid equestrian figures of Bernabò and Cansignorio; the ostentatious richness of the architecture of Cansignorio's monument; and the serene, amiable sculptures of the Madonna and Child, with their emphasis on simple masses.

The anonymous works attributed to Bonino include the tombs of Valentina and Stefano Visconti in Milan, the sarcophagus of Lambertino Balduino in Brescia, another sarcophagus relief in Sant' Agostino in Cremona, and a Madonna and Child (now in Detroit). As a group these suggest a distinct and even superior artistic personality,

reminiscent of but not identical with the creator of the Schizzi tomb. Characteristic of the group are reliefs with figures set against a flat background and placed within a shallow boxlike framed space; the Madonna sits in a *contrapposto* pose with lower body and upper torso and head turned in opposite directions; heads are formed of broad ovals, and a genial smile illuminates the faces of the mother and child. Also attributable to Bonino is a moving relief of the Crucifixion in San Nazaro, Milan, whose expressive language of gesture and emotion, like that of the Madonnas, was new to Lombardy and distinguishes Bonino, or whoever executed this relief, from the earlier Campione carvers.

Cansignorio's monument has nothing in common with the Schizzi tomb. The sarcophagus reliefs do belong to the Campionesse tradition (although they are hardly attributable to Bonino himself), but the design of the reliquary-like monument of dissolved surfaces cannot be placed securely within the master's oeuvre. Thus the monument, though signed, provides little help in establishing Bonino's artistic personality.

The tomb of Bernabò Visconti (Castello Sforzesco, Milan), with its life-size equestrian figure (completed by 1363) and sarcophagus on columns (added after the ruler's death in 1385), is conventionally ascribed to Bonino, but the attribution is debatable. While the sarcophagus reliefs are genial if formulaic interpretations of the aforementioned Madonna figures, the rider—rigid and frontal without the slightest enlivening movement—presents a stark image of political power, military invincibility, and ruthlessness. If the work is by Bonino, then the sculptor was extraordinarily adept at meeting the needs of his diverse patrons. Those of lower rank than the Visconti rulers may have preferred works displaying an intimacy and accessibility that suggests a response to Tuscan currents, whereas his seignorial patrons demanded ostentatious display and a projection of intimidating power. Clearly, Bonino da Campione represents one of the most intriguing challenges of *Trecento* connoisseurship.

Campione, Matteo Da

The northern Italian sculptor and architect Matteo da Campione (d. 24 May 1396) is best remembered for his activity at the *duomo* of Monza. He is also known to have been invited, in 1390, to direct work on the cathedral of Milan, a position he probably turned down. He is generally considered to have been the last of the "Campionesi"—a term that gained currency in the nineteenth century to denote a group of itinerant craftsmen from Campione di Lugano. By the late *Trecento*, when Matteo was active, the distinctive style of the Campionesi of the late twelfth and early thirteenth centuries had blended with the many local artistic trends of northern Italy.

A funerary inscription on the exterior wall of the chapel of the Madonna del Rosario at Monza, where Matteo da Campione was buried, celebrates the fact that he was responsible for the design of the facade of the *duomo* of Monza, the pulpit, and the (now destroyed) baptistry. Capitalizing on Monza's illustrious history as a coronation church, the Visconti family of Milan had, throughout the fourteenth century, encouraged the redevelopment of the *duomo* as a means of asserting their own dynastic claims on northern Italy. During the second half of the century, Matteo da Campione extended the cruciform early *Trecento* cathedral; by the 1390s, chapels had been built around

the existing aisles and transepts, and the facade had been heightened and widened from three to five bays to accommodate these changes. The bichromatic marble banding, a very characteristic feature of the earlier facade, was retained in Campione's extension and overall remodeling, which (despite the heavy restoration carried out from 1892 to 1908) is remarkable for its decorative exuberance. The central rose window, for example, rests within a complex register of rhythmic moldings that are adorned with leaf, rosette, and dentiled motifs. All this is framed by a series of richly carved panels filled with white marble flowers, stars, and masks that emerge from a dark marble background. In the upper half of the facade there are four rows of equally sumptuous coffering surmounted by nine blind niches.

The pulpit, which was reassembled in the early eighteenth century to form a choir gallery, is, like the facade, characterized by a profusion of ornately carved motifs. Apostles and other saints occupy a series of niches around the casket, but the details of these squat, emotionally detached figures are lost within the general decorative abundance of the pulpit. Of greater interest, however, is the marble relief, once part of the scheme but now detached from it in the north transept, depicting the coronation of an emperor. With its crisply carved details and carefully balanced composition, the work vividly evokes the glorious traditions of the *duomo*, where the kings of Lombardy and later the Holy Roman emperors received the Iron Crown,

Cancellieri Family

The merchant banker Cancelliere di Sinibaldo (fl. after 1210) founded one of the leading families of medieval Pistoia. His three sons, Amadore, Ranieri, and Sinibaldo, established three powerful and prolific branches of the Cancellieri family. Ranieri alone had nine sons, including Cialdo (d. after 1291) and Dego (d. 1293), both of whom were very active in Pistoia as professional podestas and as politicians. Other members of the family were important in banking and commerce. Rivalries were common within this large clan (e.g., Ranieri financed the city's *pedites* and Amadore financed the knights), and in 1286 true factions emerged. Ghibellines and magnates gathered around the Ranieri branch, the "Whites"; the "Black" Amadori branch attracted Guelf *popobni* and "new men." The city and *contado* (the surrounding countryside) were polarized, and violent feuding erupted.

In 1306, however, with the conquest of Pistoia by "Black" Florence and Lucca, the reunited Cancellieri ended their feud, and they headed Pistoia's pro-Florentine Blacks and Guelfs. The defeated Whites and Ghibellines rallied around an old noble family of international bankers, the Panciatichi, who opposed Florentine rule. This factional rivalry, supported by broad networks throughout Tuscany, lasted through the fourteenth century and into the fifteenth. Ironically, by 1400 the Panciatichi were pro-Florence, while the Cancellieri faction, led by Ricciardo Cancellieri, mounted a bloody and destructive revolt against Florentine domination (1401-1403) that did not end until the death of Gian Galeazzo Visconti, on whose support Ricciardo had counted.

Cangrande Della Scala

Cangrande I della Scala (Canfrancesco, 1291-1329) was the third son of Alberto I della Scala, lord of Verona. He was probably born on 8 or 9 May 1291 and was christened Canfrancesco, but from his childhood he was called Canis Magnus, or Cangrande (also Can Grande, "great dog"). Little is known of his youth. In 1294, at the age of three, he was made a knight during a courtly celebration of his father's victory over the d'Este family. Upon his father's death in 1301, he was entrusted to the care of his elder brother Bartolomeo.

In 1306, Cangrande was invested with a fief by the bishop of Vicenza and began to take part in his brother Alboino's military campaigns. The brothers collaborated as rulers of Verona from 1308 on, and in 1308 Cangrande was married to Giovanna of Svevia, daughter of Conrad of Antioch. Both Alboino and Cangrande were made imperial *vicarii* of the city in 1311, during the Italian expedition of Emperor Henry VII. When Alboino died later that year, Cangrande became the sole ruler of Verona.

Cangrande was clearly the most militarily gifted of the Scaliger lords (Scaliger was a name adopted by descendants of the della Scala). He expanded his rule over the entire mark of Verona-Treviso. He was granted the imperial vicariate of Vicenza early in 1312 and quickly established himself as personal ruler of the city. After Emperor Henry VII died in 1313, Cangrande remained loyal to the imperial party. He did homage to Frederick of Austria in 1317 and received a confirmation of his vicariate of Verona; when he refused to renounce the imperial

vicariate, Pope John XXII excommunicated him the following year. Allied with Duke Henry of Gorizia and Henry of Carinthia, Cangrande conquered much of the countryside south of Padua in the winter of 1317-1318, and most of the castles in the territory of Treviso the following September. His participation in the siege of Genoa (in the autumn of 1318) increased his stature among other Ghibelline leaders, but Cangrande's ambitions were focused on the Veneto. In 1319 he laid siege to Padua, but a defeat in August 1320 led to the lifting of the blockade. The following year, however, he conquered Feltre (June 1321) and then Belluno (October 1322). After a brief flirtation with the papal party in the early 1320s (he was negotiating with the curia to rescind his excommunication), Cangrande reaffirmed his Ghibelline connection and helped to lift the siege of Milan in 1323. He entered a league with Mantua, Ferrara, and the emperor in 1324-1325 and brought his forces to various sieges in the countryside around Modena. In 1327, Cangrande finally gained control of Padua with the help of exiled malcontents, entering the city on 11 September. Early in July 1329 he began a war against Treviso, conquering the city on 17 September. Cangrande fell ill after entering Treviso and died there on 22 July 1329. He left no legitimate heir.

While he is chiefly known for his military exploits, Cangrande also sheltered the poet Dante during Dante's long exile (1312-1318). Dante eulogized him in *Paradiso* 17 (76-93), describing him as so magnificent "that his enemies will not repress/ Their tongues from telling what things he hath done" (*Le sue magnificenze conosciute/saranno ancora, sí che'suoi nemici/non nepotran tener le lingue mute*).

The essential work on Cangrande is still Spangenberg (1892-1895), a detailed narrative political biography organized chronologically; the author's annotations are an invaluable guide to primary sources, and the work includes a few key documents (2:151-163). None of the sources for Cangrande's career, however, is available in translation. The sources most central to an analysis of his rule are *Antiche cronache Veronesi* and *Statuti di Verona del 1327*.

Canon Law Collections and Ordinary Glosses

The *Decretum* or *Concordia discordantium canonum* (*Harmonization of Discordant Canons*) was compiled and annotated by Gratian c. 1141; the ordinary gloss by Johannes Teutonicus was published c. 1215 and revised by Bernardo da Brescia c. 1245 (for manuscripts, see Kuttner 1937, 95-118). The *Decretum* contained almost 4,000 canons or chapters culled by Gratian from scriptural, patristic, conciliar, and decretal sources, together with his own comments or observations (*dicta*) regarding the canons or legal issues under scrutiny. In this work Gratian's discussion is framed in dialectical terms, that is, as a harmonization of juxtaposed arguments. The sheer breadth of the source material, combined with the scholastic method, created a new science of canonical jurisprudence. The *Decretum* was soon revised by the law teachers who first used it; they introduced a system of subdividing portions of Gratian's text, and they appended additional material drawn from both ecclesiastical and Roman legal sources. Some early editions are Paris (1500, 1503, 1547), Lyon (1554, 1559), and Antwerp (1570). Several popes of the late sixteenth century ordered the preparation of an edition of the *Decretum* and of some subsequent canonistic collections that would be authoritative in the schools and courts. This *Editio Romana* was published in Rome in 1582 at the command of Pope Gregory XIII; further editions of the *Decretum* were based on it: Turin (1670), Lyon (1671), and Paris (1687). Various subsequent critical editions attempted to present a text closer to Gratian's archetype: Halle (1747, ed. I. H. Böhmer), Leipzig (1839, ed. Emil L. Richter), and Leipzig (1879, ed. Emil Friedberg, the most useful modern edition). At the time of the present writing, scholars agreed that a new critical edition was needed.

The explosive growth of law made by the popes during the period after the publication of the *Decretum* found expression in decretals, i.e., papal letters of legal import, avidly collected by canonists. Many private decretal collections circulated during the late twelfth century, and this tradition of compilation culminated in five systematically organized collections, the *Quinque compilationes antiquae*, which were

treated by canonists as supplemental to Gratian's *Decretum*.

The first of these compilations, the *Breviarium extravagantium* or *Compilatio prima*, was collected by Bernardo da Pavia (also known as Bernardo Balbi) c. 1191; the ordinary gloss by Tancredi da Bologna appeared in two recensions c. 1210-1215 and c. 1220, Bernardo's division of 912 decretals, conciliar canons, and other texts into five topical books became standard for later decretal collections: (1) ecclesiastical jurisdiction, (2) civil procedure, (3) clergy and ecclesiastical property, (4) marriage and related matters, and (5) criminal procedure and punishment. The books are subdivided into 152 titles; Pope Alexander III's decretals figure most prominently, together with those of other popes, e.g., Gregory I, Lucius III, and Urban III. (For manuscripts of the compilation and ordinary gloss, see Kuttner 1937, 329-344.)

The *Compilatio secunaa* (the second compilation) was put together by John of Wales between 1210-1215- It contained 331 texts, almost exclusively decretals from popes of the late twelfth century {Alexander III, Lucius III, Urban III, Gregory VIII, Clement III, Celestine III, Innocent III}. These were grouped in five books and 106 titles. The ordinary gloss by Tancredi da Bologna appeared in two recensions c. 1215 and c. 1220. (For manuscripts of the compilation and ordinary gloss, see Kuttner 1937, 345-354.)

The *Compilatio tertia* (third compilation) was the work of Pietro da Benevento (also known as Pietro Collivaccino) and was promulgated (albeit probably not commissioned initially) by Innocent III in 1210 as the first officially sanctioned collection of canon law. It contained 489 decretals from the first twelve years of Innocent III's pontificate, grouped in five books and 122 titles. The ordinary gloss by Tancredi da Bologna appeared c. 1216-1220. (For manuscripts of the compilation and ordinary gloss, see Kuttner 1937, 359-368.)

The *Compilatio quarta* (fourth compilation) was collected by Johannes Teutonicus c. 1216-1217 and contained 189 texts: decretals of Innocent III from the final six years of his pontificate, and canons of the Fourth Lateran Council. These were grouped in five books and sixty-nine titles. Johannes attempted to secure the pope's official approval, but Innocent III refused. Johannes published the ordinary gloss at roughly the same time. (For manuscripts of the compilation and ordinary gloss, see Kuttner 1937, 375-381.)

The *Compilatio quinta* (fifth compilation) was put together by Tancredi da Bologna directly from the papal registers and was promulgated by Pope Honorius III in 1226. It contained 223 texts: Honorius's decretals and an imperial constitution of Frederick II (divided into nine parts). The texts were grouped in five books and ninety-four titles. The ordinary gloss by Jacopo d'Albegna was published c. 1226. (For manuscripts of the compilation and ordinary gloss, see Kuttner 1937, 383-385.)

The first four compilations were printed in an edition by Antonio Agustín, *Antiquae collectiones decretalium* (Lerida, 1576). Agustín also included Johannes Teutonicus's ordinary gloss on *Compilatio quarta*. A partial edition of *Compilatio prima* was begun by Joseph Anton Riegger (Freiburg im Breisgau, 1779). Two editions of *Compilatio quinta* alone were printed: Toulouse (1645, ed. I. Ciron) and Vienna (1761, ed. Joseph Anton Riegger). All five of the *compilationes antiquae* were only partly edited by Friedberg (Leipzig, 1882) in a form intended to be supplemented by his edition of *Liber extra*. These compilations were an object of general canonical study and practice until 1234.

The *Liber extra* (also known as *Decretales Gregorii IX*) was compiled by Raimundo de Penyafort between 1230 and 1234, and promulgated by Gregory IX in 1234. Raimundo selected 1971 decretals, almost 90 percent of them from the five compilations described above, with decretals of Gregory IX supplying most of the remainder. These were grouped in five books and 185 titles. The ordinary gloss by Bernardo da Parma appeared in at least four recensions between 1241 and 1263. Editions, some with gloss: Mainz (1473), Antwerp (1570), Rome (1582, *Editio Romano*), Turin (1670), Lyon (1671), Paris (1687), Halle (1747), and Leipzig (1839). The modern critical edition is by Friedberg (Leipzig, 1881).

The *Liber sextus* (*Sixth Book*) was compiled at the command of Pope Boniface VIII by Guillaume Mandagout, Berenger Fredol, and Riccardo Petronio, and promulgated by the pope in 1298. It contained 359 chapters organized in five books and seventy-six titles; a final section contained eighty-eight legal maxims (*regulae iuris*). The chapters consisted of canons from the first and second general councils of Lyon, and decretals of nine thirteenth-century popes (Gregory IX, Innocent IV, Alexander IV, Urban IV, Clement IV, Gregory X, Nicholas III, Martin

IV, and Boniface VIII). Early editions: Mainz (1465), Paris (1535; reprint, Aalen, 1968), Rome (1582, *Editio Romano*), and Venice (1585, 1602). The modern critical edition is by Friedberg (Leipzig, 1881). The ordinary gloss by Giovanni d'Andrea was published c. 1301 and is found in some of the printed editions listed above.

The *Constitutiones Clementinae* or *Constitutiones Clementis V* was compiled at the order of Pope Clement V and promulgated by Pope John XXII in 1317. This work contained 106 decretals grouped in five books and fifty-two titles. Two decretals of Urban IV and Boniface VIII appeared; Clement was the author of the remaining texts, including canons of the general council of Vienne. The *Clementinae* represents the last official collection of the Middle Ages—i.e., the last one promulgated by a pope. Editions: Mainz (1460), Strasbourg (1471), Venice (1479, 1482, 1484, 1485, 1490, 1491), and Rome (1472, 1473, c. 1478, and 1582, *Editio Romano*). The modern critical edition is by Friedberg (Leipzig, 1881). The ordinary gloss by Giovanni d'Andrea was published c. 1322 and is found in some of the foregoing printed editions.

The *Extravagantes Johannis XXII* was compiled as a private collection, probably by Jesselin de Cassagnes between 1325 and 1327; it contains twenty of John's decretals. Early editions were published in Rome (c. 1478) and in Cologne (1483, 1488, 1493, 1494, 1495). Jean Chappuis grouped the chronologically arranged material into fourteen topical titles and published it in 1500 in Paris as part of a new edition of canon law; this edition was essentially reproduced in Rome (1582, *Editio Romano*). One modern edition is by Friedberg (Leipzig, 1881). The definitive critical edition is by Tarrant (Vatican City, 1983). The only significant gloss was written by Jesselin between c. 1322 and 1327.

The *Extravagantes communes* was compiled by Jean Chappuis in Paris in 1500 and 1503; it contains, respectively, seventy and seventy-four "commonly circulating" decretals from the late thirteenth, fourteenth, and fifteenth centuries. The authors of these decretals were popes Boniface VIII, Benedict XI, Clement V, John XXII, Benedict XII, Clement VI, Urban V, Martin V, Eugene IV, Calixtus III, Paul II, and Sixtus IV. Chappuis grouped the texts in four books and thirty-five titles. The modern critical edition was published by Friedberg (Leipzig, 1881).

Canonization

Canonization is the official procedure adopted by the Christian church to declare one or more of its faithful, after their death, worthy of public recognition as saints. Once sainthood has been declared, the new saint is assigned a date on the calendar, entered in the canon (the list of official saints), and venerated as a model. The process of canonization was less structured in medieval times than it is at present.

Martyrs were the first faithful to be venerated as saints. Subsequently, other types of exemplary faithfulness and devotion to Christ were considered worthy of public veneration. In the first centuries of church history, martyrdom was singled out as an admirable and imitable form of witnessing for Christian belief. During the great Roman persecutions, martyrs were acknowledged as worthy of public remembrance, their date of death and place of execution were regarded as sacred, and their burial site was often chosen as a place of worship. They had offered their lives to Christ and had become united with Christ in their excruciating suffering and violent death. Not only were martyrs an example of faith to imitate; they were invoked to intercede with God for the oppressed and persecuted church on earth. Toward the end of the Roman persecutions, in the fourth century, there were fewer martyrs and more confessors: people who upheld orthodoxy and suffered strenuously to defend the faith against heresy and misbelief. The concept of sainthood was broadened further to include those faithful who excelled in doctrine, the doctors of the church; those who distinguished themselves for their works in the role of bishop, missionary, virgin, priest, deacon, abbot, abbess, monk, nun, or hermit; and in general all those who led an outstanding life of faith.

During the early stages of Christianity, sainthood was simply proclaimed by public fame. Later, a declaration of sainthood became the responsibility of the bishop in whose diocese the saint-to-be had lived and witnessed for his or her faith. The bishop continued to base the judgment of sainthood on public fame, and on a biography of the person being presented for sanctity. If the petition received approval, the body was exhumed and moved to an altar, and a particular calendar day was assigned for celebration of the saint's feast. The bishop ascertained that the saint's tomb was an object of veneration and that the saint was invoked for healing and for intercession.

Subsequently, in the course of the Middle Ages, canonization was transferred from the bishop to papal authority. This formalization of the procedure was a very long process, which took place over the entire first millennium of church history. Initially, papal canonization was simply a formal consent to transfer the saint's body to an altar, but gradually it became the only form of elevation to sanctity. The first documented papal canonization was that of Saint Ulrich, bishop of Augsburg, who died in 973 and was canonized in 993 by Pope John XV. Canonization became the sole prerogative of the papacy under Pope Alexander III in the second half of the twelfth century. In 1234 Pope Gregory IX sanctioned papal inquiry as the only legitimate process for ascertaining sainthood.

Canosa Di Puglia

According to tradition, Canusium, in the modern region of Puglia (Apulia), was founded by Diomedes. It flourished in antiquity as a Greek city famous for the manufacture of silk garments and ceramics, as well as for its commercial activity. In 318 B.C. it became an ally of Rome, and its commercial prosperity continued through the Roman era.

Canosa was the most ancient diocese (a.d. 343) in the region of Puglia, but it declined sharply in the face of the barbarians' devastation. It came under Lombard rule; then, during the Byzantine reassertion in southern Italy, it was elevated to archepiscopal status (835). Renewed destruction was brought by the Saracens' attacks (840-870). The city revived yet again under the Ottonian emperors; during this period, nevertheless, its ecclesiastical authority was joined to that of Bari, which was expanded significantly by Pope John XIX (c. 1025). After the conquest by the Normans, the center of ecclesiastical power was definitively shifted to Bari; Canosa's urban status was significantly reduced and its economic importance as a port city diminished.

Among the medieval monuments in Canosa is the Romanesque cathedral, dedicated to San Sabino and begun c. 1080. This church is especially noteworthy for its pulpit and episcopal throne, carved by Romualdo for Bishop Ursone (1079-1089). Beside the southern portal of

the cathedral stands the unusual tomb of the great Norman warrior Bohemond (d. 1111), son of Robert Guiscard. The tomb was commissioned by Bohemond's mother, Alberada. Its design perhaps reflects experiments in crusader architecture; though its interior is austere, its exterior is handsomely sheathed in marble, and its magnificent bronze door (c. 1120) carries a fulsome inscription in silver letters extolling Bohemond.

Canossa

Canossa was the site of a castle (destroyed in 1255) in the Italian province of Emilia, 12 miles (about 20 kilometers) southwest of Reggio Emilia. On 28 January 1077 it was the scene of one of the most celebrated, and enigmatic, episodes in the investiture conflict.

The journey to Canossa had begun a year earlier, at the synod of Worms (24 January 1076). This synod of German bishops, meeting under the protection of King Henry IV of Germany, declared that no one could any longer accept Gregory VII as the true pope. By virtue of his presumptive claim to the title "patrician of the Romans," Henry issued a letter in which he formally assented to the bishops' decree and commanded Gregory to renounce the papacy.

The circumstances that led to this extreme measure are not completely known, but in any case Henry and his clergy left no alternative to open conflict, especially after their decrees were seconded by a synod of Italian bishops at Piacenza. Gregory retaliated almost immediately (perhaps on 14 February) by declaring Henry excommunicate, deposed, and anathematized. He absolved the king's subjects of their oaths of allegiance to Henry and forbade them to serve Henry as king.

At this time Henry was struggling to suppress rebellious princes in

Saxony, and the news of the pope's decree gave new life to the rebellion, which was strengthened by alliances in southern Germany. In October 1076, Henry arranged a humiliating truce with his enemies. He promised to return to obedience to Gregory and agreed that if the pope had not absolved him of his excommunication within one year, the bishops and secular princes could legitimately proceed to the election of a new king. On disbanding, the rebels invited Gregory to a conference in Augsburg the next February to resolve the conflict.

Henry's great objective then became loosening the ties between the pope and the rebels. Clearly, if he were to accomplish this end, he must intercept Gregory before the pope crossed the Alps into territories hostile to the king. Therefore, with a small entourage, including the queen and some other court ladies (who were taken over the ice and snow in horse-drawn oxhides), Henry undertook a hazardous journey into Italy, finding what security he could in the territories of his mother-in-law, Countess Adelheid of Turin. The pope, upon hearing that his declared enemy was nearby, withdrew to Canossa, a castle belonging to Countess Matilda of Tuscany, together with Adelheid, Matilda, and Henry's godfather, Abbot Hugh of Cluny. The king followed him there,

At first, Gregory refused to see Henry, regarding him as excommunicate and his case as pending adjudication, perhaps at Augsburg. But after Henry, dressed in the flimsy robe of a penitent, had stood outside the castle for three days in the bitter cold, the pope was persuaded to grant him an audience (28 January 1077).

Documents issuing from that interview survive, but the intended and the actual results of the meeting remain elusive. It is clear that Henry signed an oath promising to see that justice was done according to Gregory's judgment, and granting Gregory, his entourage, and emissaries from and to him safe conduct if he should wish to go over into Germany as planned. For his part, Gregory released Henry from excommunication, administering the eucharist to him. It cannot be conclusively determined whether Gregory also reinstated Henry as king. Much later, during another crisis (in 1080), Gregory stated that he had not restored Henry to kingship; but in the meantime he had certainly referred to Henry, and dealt with him, as king. It would appear, not least from Henry's oath, that after their audience Gregory

still planned to cross over into Germany and to confer there with the king and the king's enemies.

However, the reconciliation at Canossa persuaded the rebel princes that the pope had withdrawn from their cause. The princes did not send the escort that they had promised to attend Gregory on his journey, and the pope turned back. In March 1077, the rebels elected an antiking, Rudolf of Rheinfelden. Still hoping that the entente at Canossa would lead to a satisfactory outcome, Gregory refrained from recognizing Rudolf as legitimate king until 1080, when he renewed his excommunication, deposition, and curse against Henry, just before Rudolf was killed by Henry's forces in the battle of the Elster—an event that for some people cast Gregory's character as vicar of God into doubt.

Canossa became a powerful, almost mythical, symbol in literature about the conflict between church and state, but what happened there and its actual consequences remain difficult to establish.

Cantare

Cantare, an Italian narrative genre in verse, emerged in the late medieval period, flowered from the mid-fourteenth century through the fifteenth, and faded during the course of the sixteenth century. The term *cantare*, from the verb "to sing," refers to an individual poem as well as to one of its internal divisions. The latter meaning was in use by

1307, as substantiated by a Bolognese document. The earliest extant manuscripts date from the 1340s. As the name of the genre implies, the works were often sung, to the accompaniment of an instrument such as the viol, although later examples seem to have been destined for individual reading. The recitation of poetry with musical accompaniment is as old as antiquity, and various meters have been used, but in Italy the *cantare* was typified by an eight-line stanza (*ottava rima*) called an octave. Overall length varied from extremely short (*Cantare del padiglione*, or *Cantare of the Pavilion*, has twenty-two octaves) to epic proportions (*Orlando* has sixty divisions of thirty-four to forty-eight octaves each). The optimum length for the inner divisions in a *cantare* seems to have been forty to fifty octaves. This was probably dictated by the exigencies of live performance: both the singer and the audience would have required intermissions. The longer examples were most likely recited in serial form over a period of several days. The interruption of the narrative at suspenseful moments would have virtually guaranteed an audience for the subsequent installment.

The professional entertainers who composed and recited *cantari* are variously known as *canterini*, *cantimbanchi*, or *cantastorie*. They were probably of middle-class or lower-class origin, with adequate histrionic and musical abilities, and of modest learning—and not necessarily illiterate, since some apparently wrote out their poems. They performed wherever they could draw a crowd: in public squares; at markets and festivals; and, as legal documents show, even in churches. The most renowned performers were sometimes hired by wealthy families for private celebrations. While many extant *cantari* are anonymous, the names of several of the minor poets who wrote *cantari* have survived: they include Fra Felice Tancredi da Massa; the Sienese poets Neri Pagliaresi, Niccolò Cicerchia, and Pier da Siena; Niccolò da Arezzo, who was blind; Guidaloste da Pistoia; Lorenzo Obbizzi, who was born in Prato but lived in Lucca; and the Florentines Antonio Pucci, Antonio di Goro dall'Ancisa (who, after the Ciompi revolt, worked in Lucca), and Antonio di Guido.

The preponderance of manuscript evidence suggests that Tuscany was the birthplace of this genre. It seems to have prospered especially in Florence: one document notes that in the 1470s the commune of Perugia, in need of such entertainers, sent away to acquire the services

of skilled Florentines. Other centers of *cantari* were Siena, Pisa, and Lucca. To judge from contemporary testimony, such as the so-called *Cantare det Cantari*, there was a vast production, and individual *canterini* may have committed enormous repertoires to memory; however, the evidence is incomplete, owing to the loss of written copies and to the improvisational nature of the performances themselves.

Cantari demonstrate certain standardized structural features, such as a brief religious invocation contained in the first octave. This was often followed by an appeal to a patron or to the listeners (or reader). Next came a summary of events narrated in the preceding *cantare*. A section frequently ended with a "preview of coming attractions," a remark by the *canterino* on the need for a pause, and a reminder to the audience that the narration would continue at a later time. Inner divisions as well as entire poems generally concluded with sacred *congedi* (leave-takings), which were at times as short as a single line of verse.

Subject matter was drawn from a wide range of sources, both oral and written. Thus, rather than being considered a purely popular tradition, *cantari* are more properly called semipopular or semilearned. Numerous *cantari* reflect earlier narrative models: the "Carolingian material" (*Orlando, Spagna*), the Breton cycle (*Fiorio e Biancifiore*), and French *lais* (*Bel Gherardino*). Another group of *cantari* which emerged in the fifteenth century had classical subjects such as the Trojan war (*Eneas*), the deeds of Roman heroes (*I fatti di Cesare*), or the amorous stories of Ovid's *Metamorphoses* (*Orfeo, Piramo e Tisbe*). Some *cantari* included scabrous, novella-like tales such as those found in the *Decameron* (*Storia del calonaco di Siena*), while others had a devotional function and were based on the Bible or hagiographic legends (*Passione di Cristo, Cantare delgiudizio*). Still others chronicled current sociopolitical events, thereby revealing a commemorative or encomiastic purpose (*Cantare dellaguerra degli Otto santi*).

Thus *cantari* may be viewed as commercial products, created primarily to delight an audience. With the diffusion of printing in the late fifteenth century, this trait became even more evident: *cantari* continued to be produced, and many were apparently aimed at the newly created mass audience. In later *cantari*, for example, authorial addresses to listeners (*voi*) have been replaced by addresses to a single reader (*tu*).

Canzone

Before the appearance of the sonnet and the *ballata*, the *canzone* was the most important vernacular lyric form in Italy. Of unspecified length and with no strict metrical form, it displays great variety in its stanzaic structure and rhyme schemes, often freely intermingling line lengths; usually hendecasyllables are mixed with heptameters or sometimes pentameters. Special terms are used to describe the internal components of a stanza: the *fronte* (opening or head), composed of two *piedi* ("feet") of equal length, and a *sirma* or *cauda* ("tail") of unequal length. Tuscan examples tend to close with an envoi. Stanzas can have from seven to twenty lines, and the envoi from three to ten. Thematically, the *canzone* was originally a love lyric, but it could also be political, religious, or even didactic. Other themes were nature and high human concepts such as nobility and courtesy.

Canzoni were first produced in the thirteenth century by poets at the Sicilian court of Emperor Frederick II, which was frequented by troubadours and minnesingers. The Provençal *canso* in the style of Giraut de Borneil was a primary influence on the formal development of the Italian *canzone*. A secondary strain of influence from the German *Minnesong* is observed in the Sicilians' use of a *piede* of three or more lines, rather than the generally shorter Provençal *pedes*.

Poets of the Sicilian school who wrote *canzoni* include Emperor Frederick himself (*S'eo trovasse Pietanza*), King Enzo, Pier della Vigna (*Arnore, in cui disio ed ho speranza*), and—chief among these—Giacomo da Lentini (*Amor non vole ch'io clami, Meravigliosamente*). Later in the thirteenth century, the genre was adopted by poets from various

regions, and especially by the Tuscan *stilnovisti* (poets writing in a "sweet new style"). Important examples are those by Giacomino Pugliese (*Morte, perché m'hai fatta sì gran guerra*), Rinaldo d'Aquino (*Per fin'amore vao sì allegramente*), Bonagiunta Orbicciani da Lucca (*Avegna chepartensa*), and the Florentines Guido Guinizzelli (*Al cor gentile*), Guido Cavalcanti (*Donna meprega*), Monte Andrea (*Donna di voi si rancurd*), and Chiaro Davanzati (*Abi dolze e gaia terra fiorentina*). Chiaro produced some sixty extant *canzoni*. Guittone d'Arezzo, who wrote *canzoni* with religious and political themes as well as the conventional themes of love, is credited with reintroducing the Provençal *tornada* (called in Tuscan *commiato* or *congedo*), a leave-taking that concludes the poem. Dante, in his treatise *De vulgari ehquentia*, praised the *canzone* as the highest vernacular lyric form, and the most difficult to write. He himself rose to the challenge and included *canzoni* such as *Donne ch'avete intelletto d'amore* and *Amor, che movi* in his *Vita nuova* and *Convivio*.

By the mid-fourteenth century, the *canzone* became very elegant, with an impressive match of content and form. Many of Petrarch's *canzoni* (e.g., *Chiare, fresche, e do lei acque*-, *Nel dolce tempo de la prima etade*) demonstrate not only high technical achievement but refined literary strictures. Petrarch's *canzoni* typically have five or six stanzas with an envoi. In *Prose della volgar lingua*, Pietro Bembo (1470-1547) praised Petrarch's achievement, thus helping to bring the *canzone* into prominence in the sixteenth century. By this time it had further evolved into a musical incarnation known as the *madrigal* (a single stanza with short and long lines mixed freely). Later writers of *canzoni* include Agnolo Firenzuola (1493-1543), Jacopo Sannazaro (1458-1530), and Torquato Tasso (1544-1595).

Capua

The populous Roman city of Capua, in Campania, was founded, according to tradition, in 598 B.C. It was dominated by the Etruscans and then, beginning in the third quarter of the fifth century B.C., by the Samnites, whose dominance lasted until Capua became an ally of Rome c. 340. Capua eventually rebelled against Rome, and with the help of the Carthaginians remained independent of Rome until it was forced to capitulate in 211 B.C. The population was dispersed, and the city lost its status until 61 B.C., when Julius Caesar established a new colony there. It was then restored as the capital of Campania and enjoyed the patronage of Augustus and Nero. It continued to prosper during the imperial period, while other cities declined. According to Ausonius (c. 310-c. 395), Capua was the third city in Italy after Rome and Milan, and eighth among all the cities in the Empire.

Despite being devastated by Gaiseric in a.d. 456, Capua remained one

of the principal cities of Campania, but Saracens destroyed the city c. 842. By this period, Capua was becoming an important dependency of the Lombard principality of Benevento. Landolfo established his rule in Capua in 847 and managed to resist the domination of the principality of Salerno. In the late ninth century Landone, the son of Landolfo, refounded Capua on a new site on the Volturno River near the Casilino Bridge, and this would become the modern city of Capua. Atenolfo, nephew of Landone and count of Capua, also became prince of Benevento (900-910), and on his death the two cities were apportioned to his sons: Landolfo I received Benevento and Atenolfo II received Capua. The complex interactions of their descendants once again intertwined the destinies of these two cities. The Ottonian ambitions in Italy in the tenth century drew Capua into a shifting relationship which, after the intervention and death of Otto III, resulted in the reconstitution of the principality of Capua and the establishment of a new ruling line from the reigning family in Benevento (1001).

In the early eleventh century, Capua was caught between the German emperor Henry II and the Byzantines of southern Italy, who were contending for ascendancy in the region. Pandolfo IV and his brother, the abbot of Monte Cassino, supported the Byzantines in this conflict and were victorious: they succeeded in reclaiming Capua and in establishing their own ascendancy in Naples. Also, Capua's control over the abbey of Monte Cassino was established. Pandolfo became allied with one of the first important Norman warlords, Count Rainulf, who had been granted the city of Aversa by the duke of Naples; and on behalf of Emperor Conrad II, Pandolfo was driven out of Capua. However, after a brief period of exile in Constantinople he returned to Italy and succeeded in recovering Capua and its territories. His status was confirmed by Emperor Henry III in 1047, and he and his descendants resumed their rule. The Norman lord Richard Drengot, count of Aversa, was granted papal investment in Capua in 1059, and in 1062 he seized the city, ending its Lombard regime. Richard I, prince of Capua (1062-1078), established Norman feudalism in the Lombard Campania, and until his death Capua was the regional center of power. Richard's descendants, originally subjects of Robert Guiscard, transferred their allegiance to the counts of Sicily, the second of whom, Roger II, compelled the surrender of Capua in 1134. Thereafter, Capua's

history was part of that of the Norman regime of southern Italy and its continuations.

There are considerable archaeological remains from the Roman period in Capua. Little remains from the Lombard period, and only fragments of Norman buildings, incorporated into later structures, have survived. Fortifications from the period of Frederick II are still present, as well as some fourteenth century palace and church constructions. In the fifteenth century, elements of Aragonese and Catalan styles were introduced into new constructions and into earlier constructions that were still going on.

Carnino Ghiberti

The thirteenth-century merchant and poet Carnino Ghiberti belonged

to one of the main Florentine Guelf families of the second half of the *Duecento*. He is remembered for his four *canzoni* in MS Vatican Latino 3793 (two are anonymous in Florentine MS Banco Rari 217). In their array of motifs and their formal technique, Carnino's compositions defy stagnant categories of stylistic alignment (e.g., "Guittonean"). Carnino draws from lyric tendencies as diverse as the salamander as a paradoxical symbol of the lover's condition (in the courtly *Disioso*) and the sarcastic practical politics of wealth in the *mondo comunale*, reminiscent of his contemporary Monte Andrea and an apparent counterpart of twentieth-century realpolitik (in *Pot ch'è*). His amplification of the courtly locus of the faithful assassin in *Luntan* anticipates Dante's *Inferno* (19.50-51). With regard to prosody, Carnino uses combinations of oral-based *capfi nidas* to link stanzas, experimental rhyme schemes, and studied lexicon.

Carolingian Material in Italy

Carolingian stories—as distinct from the Breton cycle ("matter of Britain") or the classical cycle ("matter of Rome")—were an important source of subject matter for medieval narratives. The Carolingian stories were based on the legendary exploits of Charlemagne (Carlo Magno in Italian) and his faithful knights. There are documents describing the deeds of the historical emperor (742-814), but the legends create for him a fictional persona: the defender of Christendom against Islam. Although the origins of this material are problematic, it seems clear that the legends, written in Latin and in various vernaculars, developed quickly and spread throughout western Europe. The most important epic was the *Chanson de Roland* (composed by the late eleventh century), which was inspired by the historical defeat of the French army near Roncesvalles (Roncevaux), in the Pyrenees, on 15 August 778. According to this poem, the emperor's treacherous relative Ganelon ("Gano") provokes the Saracens into ambushing the Christian rear guard, led by Roland ("Orlando"). Charlemagne subjugates Spain in revenge, and converts its people to Christianity. Although the traitor Gano is executed, enmity persists between his kin the Mayence ("Maganza") and those of Orlando, the Clermont ("Chiaramontese"). This feud was developed in other epics, such as *Doon de Mayence* and *Quatre fils Aimon*. Another related cycle features the exploits of William of Orange and his relatives.

Carolingian stories were most likely imported into Italy in the thirteenth century by minstrels, pilgrims, and merchants. Since the typical heroes were Christians slain—in effect, martyred—while defending their faith, the material was legitimized and won even the approval of the church. From iconographic evidence that predates the surviving literary texts, one may surmise the great cultural importance of this material: there are sculptures of Carolingian knights on the portals of the twelfth-century cathedrals at Verona, Modena, and Fidenza; and a mosaic at Brindisi depicts the tragic defeat at "Roncisvalle." Saint Francis compared his followers to the paladins Orlando and Olivieri. The names of Carolingian heroes were in common use, as is shown by thirteenth-century documents, and Dante included several in his *Commedia*.

The production of this material in Italy lasted for centuries, and its various phases are characterized by medium (oral or written, prose or

verse) and by the degree to which innovations appear. At first the "matter of France" served as a narrative mainstay of the *canterini*, who, in the tradition of minstrels, entertained their audiences with epic poetry set to musical accompaniment. Although the early audiences were probably illiterate commoners, handwritten and printed copies of Carolingian narratives appear in the library inventories of aristocrats of the later fifteenth century.

The rich Carolingian narrative tradition of the fourteenth and fifteenth centuries is attested to by many surviving manuscripts from the Veneto and Tuscany. Examples of epic poems in verse in the hybrid Franco-Venetian language include *Entrée d'Espagne*, *Prise de Pampelune*, *Huon d'Auvergne*, *Aquilon de Bavière*, and *La geste francor*, a cyclic compilation. During this period prose and verse versions existed side by side, and texts were composed in various regional dialects. In fourteenth-century Tuscany, the eight-line stanza (*ottava rima*) emerged as the preferred meter for narratives in this vein (*cantari*), a practice which continued through the sixteenth century. Popular legends such as *Aspramonte*, *La Spagna*, and *Rinaldo da Montalbano* were produced in verse and prose.

With the diffusion of printing beginning in the late fifteenth century, one finds an explosion of "battle books" written in *ottava rima*. To meet an increased commercial demand, many new legends were created,

based on the exploits of the sons of the original heroes (e.g., Rinaldo da Montalbano, Guidon Selvaggio). Long *ottava rima* epics reflected the individualistic voices of great poets; these epics included Pulci's *Morgante* (a humorous reworking of the fourteenth-century *cantare Orlando*), Boiardo's *Orlando Innamorato* (an idealization of the traditional heroes and conventions), and Ariosto's *Orlando Furioso* (an ironic treatment). In the mid-sixteenth century several women, such as Tullia d'Aragona and Laura Terracina, also composed works in this genre.

In Italy the material became an object of pleasure and delight for the listener or reader, marking a significant shift from the solemnity of the French epic. The ever-evolving nature of the material in Italy ensured its survival. Changes varied according to century, region, individual author, and audiences' demands. The Italian versions were not so much direct translations as free reworkings of French models. One notes, for example, a gradual change of tone or emphasis from religion and nationalism to individual conflicts and adventures. Amorous and fantastic elements usually associated with the Breton cycle were introduced to varying degrees. Roland (Orlando) is given an Italian origin (in accordance with ethnocentrism). Charlemagne or Carlo Magno becomes old and decrepit; and set against his loss of authority and dignity there is a corresponding rise in the power of the traitorous Maganzesi. Other Italian modifications to the French originals include the creation of new characters, especially legitimate or illegitimate offspring of conventional heroes, and innovations such as the woman warrior (Meridiana or Antea in *Orlando*; Galiziella in *Aspramonte*). Italian authors combined related tales into cycles, reordered events, and constructed complex genealogies for their heroes. These processes call to mind the special contribution of the Florentine Andrea da Barberino (c. 1371-c. 1431) to the development of Carolingian material in Italy. Andrea's vast prose output, realistic representations, pseudo-chronicle style, and psychological nuances met the needs of a largely bourgeois audience. In his *Aspramonte*, *Ugo d'Avernia*, and *Le storie Nerbonesi* he did not merely follow the earlier *chansons de geste*; his extensive familiarity with their narrative conventions enabled him to create a virtual Italian folk hero, Guerrino il Meschino. With Andrea, the long process of transformation of the Old French material is complete.

Carroccio

The *carroccio* was the standard-bearing cart, usually drawn by oxen, of the northern Italian cities. It served as a symbolic focus of patriotism and a rallying point in battle. These carts were meant to unite the divergent social groups within the emerging city-states of Lombardy and Tuscany. Their use (at least as early as 1039) paralleled and coincided with the adoption of civic patron saints and the development of the commune and an independent *popolo* in many cities. The main purposes of the carts were to accompany a city's troops on campaigns, to serve as a platform for patriotic or pious harangues and for celebrations of the mass before battle, and to provide a highly visible point of reference for troops during battle. To lose a cart to an enemy was shameful, and captured carts were often treated brutally.

The earliest known Milanese cart was that of Archbishop Aribert (1039). It consisted of "a high wooden pole like the mast of a ship which

was fixed to a strong wagon; at the top was a gilded apple and from this descended two ribbons of dazzlingly white cloth, and in the center a holy cross was painted with our Savior portrayed, his arms extended," In the later twelfth century Saint Ambrose (the patron saint of Milan) replaced the crucifix, and later still the cloth was scarlet and a gold cross replaced the apple. Three pairs of oxen drew this *carroccio*, which clearly embodied both ecclesiastical and civic symbolic elements. Soldiers of Cremona and Parma captured the Milanese wagon in 1149, and in 1160 imperial troops killed the oxen, captured the banner, and overturned the cart. When Frederick I Barbarossa captured Milan the next year, he seized the *carroccio* and ninety-four civic banners as booty. At Legnano in 1176, however, Milanese troops rallied around the *carroccio*, warding off defeat at Frederick's hands. When the Milanese invaded the area of Cremona in 1213, they lost both an important battle and their *carroccio*; and in 1237, at Cortenuova, the Milanese *carroccio*, after being stripped of its ornaments and reluctantly abandoned by the Milanese army, was taken by Frederick II and sent to Cremona and then Rome, where it was displayed in the Campidoglio.

The *carrocci* of other cities differed in ornamental detail, but all served the same functions. The wagons, masts, and banners were carefully tended in peacetime and were ritually blessed before use. Peacemaking between rivals within a single city often occurred around the *carroccio*, and *carrocci* were exchanged when Parma and Cremona ended their hostilities in 1281. In the 1230s Fra Giovanni preached civic peace and reconciliation from the *carrocci* of Padua, Brescia, Mantua, and Vicenza, and from that of Verona he declared himself *podesta* and duke of Verona. Often, legitimate *podesta* took their oaths of office from the city's *carroccio*, and captured cities swore submission from the *carroccio* of the victor.

Despite their importance in peacetime, *carrocci* were above all meant to bring together for battle the often fractious elements of the city-state. Both nobles and commoners guarded the *carroccio* on campaigns, and both were expected to fight to the death to protect it in battle.

By the early fourteenth century, with the advent of professional armies and leaders, the *carroccio* fell into disuse, so that the historian Giovanni Villani (1275-1348) felt it necessary to describe in detail the Florentine cart which had been captured and burned by the Sienese at

Montaperti eighty years before.

Casentino

The Casentino is a mountainous geographic region east of Florence and north of Arezzo. Although the region has no official status, it is generally considered to be bounded on the west by the Arno valley (the source of the Arno River is in the region, on the slopes of Monte Falterona) and on the north and east by the borders of Tuscany with the Romagna and the Tiber valley. In literature, the Casentino features prominently in the torment of the counterfeiter Master Adamo in Canto 30 of Dante's *Infemo*, as the limpid, rushing waters of the Arno descending from "the green hills of the Casentino" remain just beyond the thirsty man's reach. Dante's description is apt: the terrain of the Casentino is predominantly mountainous, dotted with small villages interspersed with considerable forests, although in 1427 a less poetic document—a tax return—described the Casentino as "harsh and wild." Partly for this reason it was home to many small religious communities and hermitages, such as Camaldoli, Prataglia, and Vallombrosa. Although the Casentino is now one of the least populous regions of Tuscany, that was not the case during the Middle Ages, especially before the fourteenth century, when it was controlled by the Guidi

counts.

Fortified strategic centers of power in the Casentino were crucial to the extension of the power of the Guidi counts over northern and eastern Tuscany in general. The Guidi, unlike many other Tuscan feudal and noble families, practiced partible inheritance rather than primogeniture. By the fourteenth century, therefore, the patrimony of the Guidi began to become fragmented; and with that fragmentation the unified power of the family's various branches also began to break up. Although the Guidi counts were officially overlords of the Casentino until 1440, many of the region's major towns, including Stia, Pratovecchio, and Bibbiena, had already acceded to domination by Florence and had been folded into the rapidly expanding Florentine territorial state.

Although the Casentino has been associated with a pastoral economy since the late Middle Ages, the surviving evidence indicates that sheep and cattle did not become a prominent feature of the local economy until the thirteenth century. The earliest documentation concerning the Casentino region comes from the eleventh century, and it shows that even at this relatively early date transactions involving land were fairly frequent. In the valley areas of the Casentino, grain, wine, and chestnuts were the most important products of agrarian activity, which was supported by a large number of mills, most of which had disappeared by the early fourteenth century. Although the pastoral economy of the Casentino in the late medieval period may have been a continuation of what had existed all along, there was certainly an important relationship between the growth of that economy in the fourteenth and fifteenth centuries and the developing cloth industry in Florence, coinciding with the increase in Florentine domination of the countryside.

During the late Middle Ages the mountainous terrain of the Casentino and its cooler summer climate (as was also true in a neighboring area, the Mugello) favored another "growth" industry: the wet-nursing of babies and the foster care of children from the foundling homes of Florence. The women who nursed other women's children made up their own corporate group, with their own popular carnival songs. The archives of urban charitable institutions provide rich documentation for their economic life. Salaries for wet nurses were so

low (although higher than the salaries of foster parents) that peasant families clearly considered wet-nursing a supplemental rather than a basic income. The majority of wet nurses appear in the records of institutions only once, in many cases with instructions that the institution pay a third party directly to settle an obligation. This microeconomy of wet-nursing has implications beyond the preoccupations of social historians, since, along with the "pastoralization" of the region in the late Middle Ages, the Casentino would make an excellent test case for the extent to which medieval cities relied on exploitation of the countryside to fuel their booming commercial enterprises.

However, there is not much evidence to support the centrality of the Casentino region in debates over other aspects of the economy and social structure. In the Casentino—unlike medieval Latium and southern Italy—the *castelli* do not appear to have altered the relationship between landowners and peasants in any significant way. The *castelli* of the Casentino seem instead to have functioned more as symbols of power and status than as a network of aristocratic power, at least in the early Middle Ages.

Some rural dwellers moved to the towns of the Casentino in search of opportunity. One powerful local family of Poppi, for example, had moved there from a small village and had initially become blacksmiths. The last count of Poppi rewarded his family's wet nurse with a grant of land, a house in Poppi, and stables. Townspeople in the Casentino, like their counterparts elsewhere in Tuscany, balanced urban real estate with holdings in the country, and not until the sixteenth century did they begin to focus predominantly on the acquisition of landed property.

As the seats of power of the Guidi counts, such towns as Poppi and Bibbiena became small commercial centers in their own right and centers of provincial administration later on under Florentine rule. The Florentines were oriented at first more toward Arezzo, especially toward the bishops of Arezzo and their ecclesiastical holdings, but the strategic importance of the Casentino was not lost on them. The Casentino became one of the most important symbols of the

Florentines' self-adulation when, in the summer of 1440, the Milanese hoped to capitalize on chronic local discontent with Florentine rule by inciting rebellions and thus making Florence's capitulation to the Milanese forces a foregone conclusion. Indeed, the Milanese apparently entertained the notion of using the humanist Leonard Bruni, who was an Aretine by birth and a former chancellor of Florence, as the focus of a conspiracy. The battle of Anghiari, which was fought in the Casentino by mercenaries (and in which the only death during the first day came when one combatant was trampled by a horse), resulted in a victory for the Florentine side and the formal demise of the power of the Guidi counts as an administrative presence in the Casentino. The battle sealed the reality of Florence as a presence in the Casentino, and the importance of the area to the Florentines can be inferred from their two heroic but doomed attempts to commemorate it in 1503: Leonardo's experimental painting on the walls of the Palazzo Vecchio in Florence fell apart, and Michelangelo's attempt was interrupted by his summons to Rome by Pope Julius II. The Florentine representation survived only in the preparatory drawings of the two artists and in Vasari's completion of the project under the patronage of Grand Duke Cosimo I (r. 1537-1574). The history of the Casentino ceased to be its own as its provincial elite became the earnest servants of Florence's grand dukes.

Cassiodorus

Flavius Magnus Aurelius Cassiodorus Senator (c. 490-c. 583 or 585), a statesman, ecclesiastical writer, and educator, was born to a senatorial family from southern Italy. His life can be divided into a political period from 507 to c. 540 and a scholarly and monastic period from 540 to his death.

Cassiodorus served the Ostrogothic rulers in various positions: he was quaestor in 507, ordinary counsel in 514, master of offices from 523

to 527, and praetorian prefect from 533 to 537. He also applied his literary talents to glorify the Ostrogoth regime. During his political career, he produced *Chronica*, a chronological account of the Italian rulers up to 519; *Historia Gothorum*, a history of the Goths (now lost); and *Variae*, a collection of state papers and diplomatic correspondence that became popular for its artful rhetoric.

Cassiodorus retired from public service c. 540 and moved to Constantinople, where he devoted himself to ecclesiastical writing. He added to *Variae* a philosophical thirteenth book on the nature of the soul, *De anima*; and he embarked on *Expositio Psalmarum*, a complete commentary on the Psalms that was to occupy him until 548. In *Expositio Psalmarum* he attempts to rework Augustine's *Enarrationes in Psalmorum* into a more accessible form; Cassiodorus's orderly method, didactic approach, and reliance on allegorical and numerical symbolism provided a model for medieval scriptural exegesis.

Probably sometime before he moved to Constantinople, Cassiodorus founded the monastery of Vivarium on his family's property in Squillace, on the southern coast of Italy. In 554, he himself settled at the monastery. He was a strong believer in institutionalized classical and Christian education, and he fashioned Vivarium as a theological school and scriptorium. Cassiodorus believed that the monastic ideal should emphasize study above all. To that end, he arranged for the extensive recopying of manuscripts, commissioned the translation of theological writings from Greek into Latin, and produced his most important later work, *Institutiones divinarum et saecularum litterarum* (*Institutes Concerning Divine and Human Readings*, c. 562).

Institutiones provides a manual for monastic scholars and copyists and explains the motivations behind Cassiodorus's library and school. In the first book Cassiodorus describes the manuscript collection at Vivarium, indicates the methods copyists should adopt, instructs his readers in the study of scripture, and identifies heretical works to be avoided. In the second book, Cassiodorus sets forth his views on the seven liberal arts, which he deemed necessary for the proper education of Christian students. *Institutiones* included a detailed bibliography on theology and the liberal arts that would benefit manuscript collectors for years to come; and Cassiodorus's concise examination of the liberal arts influenced writers such as Isidore of Seville (Saint Isidore, c. 560—

636) and Rabanus Maurus (Hrabanus, Rhabanus; c. 780-856).

Late in his life, Cassiodorus composed *De orthographia*, a spelling handbook to be used as a reference by manuscript copyists.

With Cassiodorus's death came the demise of the monastery at Vivarium, but the manuscripts his scriptorium had produced circulated for years throughout medieval Europe. His legacy, moreover, reaches beyond these manuscripts. By founding his school within the monastery itself, Cassiodorus helped to shape monasticism as an educational movement. Monasteries like the one at Vivarium became indispensable agents of the transmission of classical and Christian thought in early Christian Europe.

Cassoni

Cassoni are chests produced in medieval Italy, usually as pairs and usually in connection with weddings. More often than not, these bridal chests received painted or molded decoration, including coats of arms, figures, and scenes. Although few *cassoni* made before 1375 have survived, we learn much about them from other sources of information: documents such as family records, descriptions of wedding rituals, payments to craftsmen, and sumptuary laws; fourteenth-century paintings that show *cassoni*; and works of fiction, such as Boccaccio's tales, in which *cassoni* figure.

The term *cassoni* (singular, *cassone*) did not exist before the sixteenth century. Medieval Italians called a bridal chest a *forziere*, meaning a strongbox locked with a key.

Forzieri or *cassoni* resemble other chests and trunks of the late Middle Ages, and yet they are different. A *cassone* produced in Tuscany shortly after 1300 and now in London exemplifies the particular forms

the bridal chests took. This *cassone* is a rectangular box about 3 feet (somewhat less than 1 meter) high and nearly 5 feet (about 1.5 meters) long, topped with a curving lid. Unlike other chests of its period, it bears decoration: molded gesso figures distributed across its front and sides. *Cassoni*, then, offered surfaces for figural imagery, like other but much smaller objects made in Europe throughout the medieval period, such as coffers, portable altars, and reliquaries. *Cassoni* are also analogous to the long base panel, or *predella*, which first appeared in Tuscan altarpieces shortly after 1300. By the end of the fourteenth century in Florence, the decoration of *cassoni* became a subspecialty of the craft of painting. A painter who adorned only *cassoni* was called not a *dipintore* but a *forzerinaio*, from the contemporary term for a bridal chest.

Cassoni served as bedroom furniture. Inventories and other evidence indicate that, in the home, they were usually placed in what we would now call the master bedroom, the private chamber where the man and woman who headed a household slept. Like other chests, *cassoni* were containers, but they were containers of a special kind. They held precious possessions such as fine textiles (brocades and silks), splendid gowns, jewelry, and silverware. *Cassoni* typically held the trousseau that a patrician bride of the later Middle Ages brought to her new home. Loosely, a *cassone* can be seen as a counterpart of the modern hope chest; however, the hope chest, at least until recently, held wedding and marital finery accumulated by a single woman in anticipation of marriage, whereas *cassoni* represented a marriage already negotiated and, often, consummated.

In Italy during the late medieval period, *cassoni* were bound up with the rites, economics, and ideology of marriage. According to many accounts, mostly Tuscan, marriage was then a thoroughly secularized institution, whose essential element was the common and public consent of both bride and bridegroom to their union. After long negotiations between heads of families to arrange an alliance by marriage, the future spouses met in public to pledge their troth—an act that corresponds to the vow "I will" in a modern wedding ceremony. Often, there was an interval of months between a betrothal and the actual wedding. The wedding itself was marked by further public ceremonies, including a great banquet and finally a procession through

the streets that marked the removal of the wife by her husband from her father's house to her new home. *Cassoni* appeared at an early stage of these ceremonies. They were usually commissioned after the two families had agreed to the terms of the marriage, including the dowry, but before the betrothal. Usually the father of the bride engaged carpenters and painters to fashion a pair of bridal chests, which were to be ready for the conclusion of the nuptials. Sometimes, though rarely, the bridegroom's family commissioned *cassoni*. *Cassoni*, then, began to take shape after the marriage negotiations and at the request of the bride's father; and these chests were to contain the bride's dowry.

Cassoni also played a public role in the concluding rites of the marriage. During the procession when the bride was taken to her new home, porters carried her *cassoni* on their shoulders through the public streets. In this case the *cassoni* functioned as an outward and visible sign of the dowry, of which they were a part. They can also be seen as akin to trophies or spoils of war like those borne in triumph by victorious generals returning to ancient Rome. Still another way they can be regarded is as a sign of transfer, or of a new matrimonial alliance and union.

In the nuptial chamber, according to some inventories, the *cassoni* flanked the bed. Since they always appeared in pairs, *cassoni* were an image of the components of the marriage—the bride and bridegroom. *Cassoni* painted later, during the Renaissance, make this idea explicit: their inner lids represent couples, a man for one chest, a woman for the other; sometimes these figures are generalized, but sometimes they are famous personages such as Paris and Helen.

The decorations on one fourteenth-century *cassone*—the chest in London mentioned above—indicate its ceremonial and ideological connotations. It has three repeated scenes: a man with a hawk rides a horse; a woman on horseback holds a whip; and these figures are also shown standing beneath a tree, like Adam and Eve in the garden of Eden. These simple reliefs embody a complex symbolic code that—in the fashion of late medieval imagery—speaks of courtship, love, and union.

Giovanni di Francesco Toscani, *Scene in a Court of Love* c. 1425. Tempera and gold on wood panel. Elvehjem Museum of Art, University of Wisconsin-Madison, Gift of the Samuel H. Kress Foundation, 61.4.3.

As noted above, the fourteenth-century sources concerning *cassoni* include not only private accounts of weddings, payments, and family chronicles but also sumptuary laws. The most notable of these laws is a Florentine statute of 1356; its provisions included regulations for *forzieri* commissioned for weddings. This statute restricted the price of a *cassone* and its contents to fifty florins, but in 1356 that was a very substantial sum. Thus the statute indicates that *cassoni* had become a luxury to be commissioned and displayed by a patrician elite.

There are also visual representations to complement the documentary record. For example, c. 1300 Giotto painted an Annunciation to Saint Anne (in the Arena Chapel, Padua), in which Anne (the mother of the Virgin) kneels in her chamber, just beside a *cassone* set against the wall. Another Florentine painter, Giovanni Toscani, c. 1425, showed a porter bearing on his shoulders a *cassone* that he is delivering to a lady's chamber. This scene forms part of a larger pictorial narrative that was itself originally the front panel of a *cassone* (it is now in Edinburgh).

Such depictions by Giotto and other masters, including Pietro Lorenzetti (Birth of the Virgin, 1342, Siena), indicate that there were two types of bedroom chests in the fourteenth century. One was tall and relatively narrow, much like the *cassone* in London; the other was much lower and longer and appears at the side of a bed, serving as a step. Some paintings show *cassoni* that are relatively plain. In such works the individual artist's sense of color and design may have determined the depiction—that is, the artist may have felt that a richly figured *cassone* would detract from effect of the composition as a

whole. However, the fact that plain *cassoni* appear in paintings may also suggest that *cassoni* were more varied than the surviving examples indicate: they may have ranged from unadorned to ornate, and from inexpensive to costly, reflecting the social divisions of medieval Italy.

Toscani's painting shows the opening episode of a tale from Boccaccio's *Decameron* (2.9), and so it represents another source of information; fiction. A *cassone* also figures in a second story from the *Decameron* (8.8). In both stories, the chest, which Boccaccio calls a *cassa*, has a comic function. In the first, a villain smuggles himself into the heroine's bedchamber concealed within a chest. In the second, a *cassone* becomes a makeshift bed where a man makes love to his neighbor's wife (it must therefore have had a flat lid). Thus the *cassoni* in these tales become staging areas for attacks on matrimony—a use that was never intended by their makers. Boccaccio's effect depended on his audience's recognition of the accustomed societal functions of *cassoni*, as well as their deeper symbolic value, their evocation of matrimony, chastity, fidelity, and wifely subservience. His use of *cassoni* in the *Decameron* subverts those values.

Verbal testimony, visual evidence, and a few objects surviving from the fourteenth century establish practical and cultural roles for *cassoni* in the late Middle Ages. As bridal chests, they were associated with the prolonged rites of weddings and with the bride's dowry. Writers like Boccaccio and painters like Giotto underline the connection between *cassoni*, bedchambers, and women who are wives and matrons. One or two actual *cassoni* present amatory imagery—such imagery was commonplace throughout Europe in the late medieval period and also suggests a range of subjects congruent with the role of *cassoni*. During the fourteenth century in Italy *cassoni* become part of a "feminine" sphere of influence and action. That situation would change during the fifteenth century, with the advent of Renaissance.

Castelseprio

Castelseprio, in the district of Varese, dates from the Iron Age, although no indication of Roman habitation has been found. A castle was built there in the fifth or sixth century, of river boulders and granite with Roman *spolia* from the region; it originally included walls, towers, canons' dwellings, several churches, and a baptistry with two fonts. This castle was largely dismantled in the twelfth century.

The most significant existing structure on the site is the small church of Santa Maria foris Portas. This church has a single nave that expands into three apses, each one slightly more than a semicircle and accessed by a wide archway. Preceded by a low narthex, the building is roofed entirely in timber, with a flat roof over each apse. The dating of Santa Maria is disputed, but a period by which it must already have been built is provided by graffiti that mention a contemporary archbishop in Milan, Ardericus (936-948). A date in the seventh or eighth century has been postulated because of the architectural plan, which is rather eastern in style and may have been influenced by various popes from eastern provinces who were then on the throne. Paleographic

comparisons have also been used to support this early dating. However, some scholars date the building slightly later, on the basis of technical evidence that would put the structure itself close in time to the paintings inside.

These paintings—frescoes discovered in the eastern apse in 1944—are beautiful but even more controversial than the date of the church. They are the only remains of what some scholars assume to have been a program of wall paintings throughout the building. They are poorly preserved, but despite their fragmentary condition they are of very high quality and have therefore merited much study. Dates from the seventh through the tenth centuries have been proposed, and the arguments continue to this time. The iconography of the existing paintings relates to cycles on the infancy of Christ, but relatively recent studies have emphasized that the program, as preserved, has a Marian slant. The scenes include the Annunciation, the Visitation, the Trial by Bitter Waters, the Dream of Joseph, the Journey to Bethlehem, an expanded Nativity, and the Presentation in the Temple. In addition, there are three almost obliterated scenes; it has been proposed (again, rather recently—and convincingly) that these scenes represent Joachim's offerings rejected, the birth of the Virgin, and Mary fed by the angel. There are also remnants of two prepared thrones, an image of Christ Pantocrator, and socle decoration.

The classicizing style of the frescoes—with their swiftly moving figures and sharp-edged drapery folds set in convincing, impressionistic landscapes—shows the influence of Byzantine painting. Some details, such as Christ's nimbus with its cross of nails, have been traced to Carolingian influences. It is possible that a Byzantine painter fleeing Islam or Iconoclasm painted these lovely frescoes for a Carolingian client sometime in the late eighth century or the early ninth century, after the Frankish conquest in 774. Alternatively, the artist might have been schooled in a Byzantine style in an atelier in Italy or elsewhere before he did his work here. This proposed dating is supported by parallels to paintings in Santa Maria Antiqua in Rome and San Vincenzo al Volturno, and by historical conditions in the region of Castelseprio.

Castruccio Castracani

Castruccio Castracani degli Antelminelli (29 March 1281-3 September 1328) was born into a Lucchese family notable for its nobility and its commercial prowess. He began his career as a merchant and ended it as lord of much of Tuscany, and as a model for Machiavelli's prince.

Shortly after his family, which was Ghibelline, was exiled from Lucca and his father died in 1301, Castruccio traveled to England as a merchant. After killing a fellow Tuscan, he fled to Flanders, where he learned the soldier's art in the service of Philip the Fair. He returned to Italy by 1304, and for the next decade he fought in northern Italy as captain of a twenty-six-horse mercenary company serving, among others, Venice and Emperor Henry VII. By 1311, Castruccio had married Pina Stregghi, with whom he had nine children. Castruccio returned to Lucca after Henry reopened the city to its exiles, but in June 1314 he aided Uguccione della Faggiuola, whose Ghibelline Pisan army and its allies sacked the betrayed city. Castruccio's seizure of papal treasure led to his excommunication (1324).

Castruccio went from being a military captain to being a warlord-protector by acquiring the titles of viscount of Luni (July 1314), vicar-general of Saranza (December 1314), and imperial vicar over these territories (August 1315). He overstepped his authority, however, when he executed thirty men at Massa (Lunigiana), and he was imprisoned by Uguccione in April 1316. A popular uprising soon forced his release, and he was named co-commander—and in November sole commander—of Luc-ca's army. He was closely connected to the controlling oligarchy; thus in 1317 he became captain-general for ten years, and in April 1320 he was elected (or named) *dominus generalis* for life. Meanwhile, he developed bridges with other communes by supporting victorious Ghibelline factions and then usurping their power as their ostensible protector. Fearing eventual trouble in Lucca, he walled off nearly a quarter of the city to create Augusta, a citadel symbolizing his lordship. Though Castruccio was generally popular at home, his real base of power was his mercenary companies, for whose support he regularly spent over half the public income. In 1325 he arranged the succession of his son to his titles, in the hope of establishing a dynasty.

Between 1320 and his death, Castruccio dueled very skillfully with powerful Guelf Florence, and at times with Ghibelline Pisa. After three years of intrigue and intermittent warfare, he gained control of Pistoia and its *contado* (countryside) in May 1325. This led directly to his stunning victory over Florence at Altopascio in September 1325, and his subsequent devastation of the Florentine *contado*. It also led to Florence's submission to Charles of Calabria as protector in early 1326. Late in 1326, Florentine campaigns to regain Pistoia revealed the ineffectiveness of its larger army, and—again—the brilliance of Castruccio's generalship. The presence of the emperor-elect Lewis IV (Louis, Ludwig) of Bavaria in northern Italy spurred Florence on once more in the summer of 1327, but Lewis's arrival in Lucca cowed the Florentines. Castruccio's loyalty resulted in his appointment as imperial vicar of troublesome Pisa and as duke of Pistoia, Lucca, Luni, and Volterra (although he did not control Volterra). Castruccio followed Lewis IV to Rome and participated in Lewis's coronation there on January 17. For this, Castruccio was excommunicated a second time; moreover, while he was away Florence seized Pistoia. Castruccio responded swiftly and effectively, however, regaining the city on August 3.

Castruccio died of an illness at the height of his power and was buried in Franciscan robes in the church of San Francesco in Lucca. Almost immediately his Tuscan duchy disintegrated, and *fortuna* defeated *virtù*.

Catacombs

The catacombs of Rome are named genetically for the location of the cemetery of San Sebastiano "in the hollow"—*ad cata- cumba*—along the Appian Way. They served as places of burial for Christians and other Romans between the late second century and the early sixth century.

The long subterranean galleries of the forty-four known Christian catacombs, sometimes several levels deep and penetrated by airshafts and stairways, extend a total of nearly 100 miles (160 kilometers) beneath Rome's suburbs, respecting the ancient ban on burials within the city limits.

Perhaps as many as 750,000 Romans were buried in the simple *loculi* and more ornate *arcosolia* carved into the soft tufa walls of the tunnels by semiclerical *fossore*s and sealed with tiles and mortar. *Loculi* were marked with inscriptions or common objects embedded in the mortar; *arcosolia* might be decorated with frescoes. Some galleries open into *cubicula*, small rooms that served as crypts for wealthy families. These, too, might be painted with scenes from the Old and New Testaments, usually iconographically connected to themes of salvation (Jonah, Noah, the raising of Lazarus). It is certain that families gathered here for private memorials, but there is no evidence that the catacombs served as a refuge or sites of regular community rituals during persecutions. The catacombs were not used for such rituals until after the persecutions ended under Constantine I (r. 306-337); and catacomb burials apparently increased after Constantine's reign, waning only after the mid-fifth century.

There is a clear connection between the catacombs and early Christian popes and martyrs. The cult of martyrs that developed after the legalization of Christianity in the early fourth century provided the catacombs with a steady stream of pilgrims and devotees of the saints buried there. This led to the building of basilicas at the entrances to major catacombs beginning c. 340. By the late fifth century, however, burial within the Aurelian circuit of walls became common; this is an indication of local disruptions that peaked with the sieges by the Ostrogoths and Lombards. According to *Liber Pontificalis*, "both the churches and the tombs of the martyrs were destroyed by the Goths" during the siege of 536-537. *Liber Pontificalis* and a few inscriptions testify to restorations made during the period that followed, under popes Vigilius (537-555) and John III (561-574), but Romans would never again bury their dead in the catacombs outside the walls.

Pope John's zeal for the tombs of the martyrs led him to reside in or at the catacomb of Praetextatus on the Appian Way. Later popes who shared his zeal constructed additional basilicas, such as those over the

graves of saints Lawrence (c. 585) and Agnes (c. 630). *Liber Pontificalis* also attests to the continuation of liturgical life in these new and restored churches. However, the relics of the entombed saints were a magnet for devoted local Christians and pilgrims alike, and so the practice of "translation" arose—that is, removing the bones to other churches in Rome, and later to churches beyond the Alps. Eventually, the practice led to the abandonment of these sites.

Although translation was prohibited by Emperor Theodosius and denounced by Pope Gregory I, large-scale transfers of the remains of popes and martyrs began under Pope Paul I (757-767), ostensibly because many catacombs had become dilapidated. An influx of Christian clergy from the eastern Mediterranean at this time seems to have led Rome to relax its attitude toward translation; and translation was given an impetus by the Lombard siege of 756, because the Lombards were said to have destroyed churches and cemeteries (an assertion that is, however, unconfirmed by archaeological evidence). Nonetheless, under popes Hadrian I (772-795) and Leo III (795-816) many catacombs and their churches were repaired and maintained, and most of the graves probably remained intact. But translation, both to Roman churches and to northern European monasteries, flourished under Pope Paschal I (817-824); Paschal's church of Santa Prassede contains an inscription (817) commemorating the translation of 2,300 saints, many of whose names and clerical ranks are listed. Such activities continued until the mid-ninth century, when the popes' attention was diverted by Muslim invasions.

Relative peace in the tenth century brought some restoration of several catacombs—or at least of basilicas or monasteries atop them—and probably further translations thereafter, until few human bones, let alone bones of identifiable saints, remained. Interest in the sites continued, however, and the catacombs appear in the surviving pilgrims' guides and in actual itineraries of visitors to Rome from the late tenth century on. For example, the *Mirabilia* of the mid-twelfth century lists twenty *cimiteria* by name, and a fourteenth-century redaction adds three, remarking that these are subterranean burial areas. Whether a pilgrim could actually descend into the cool darkness of any of them remains uncertain.

Osborne (1985) argues cogently that only with the removal of the

papacy to Avignon, and the resulting dearth of clergy to serve the suburban sites, did the catacombs fall into obscurity. Thereafter, they would remain shrouded in obscurity until the Renaissance, when humanist antiquarians and looters of the Roman Academy led the way to the systematic explorations and restorations in the nineteenth century under G. Marchi and G. B. de Rossi.

Catania

By the end of the Middle Ages Catania, situated at the southern edge of Mount Etna in Sicily, was the second largest and second most important Sicilian city, and its surrounding plain was one of the most fertile and productive grain-growing areas of the island. But little is known about its commercial role before the end of the Middle Ages, which is less well documented than that of Palermo.

Catania was the setting for the struggle between Belisarius and Totila in 550, and subsequently the area remained mainly in Byzantine hands until the Arab conquest in the ninth century. Ibn ath-Thumnah, the ruler of eastern Sicily, welcomed the Normans to the region in the 1060s, and for a time he was allowed a degree of autonomy under their overlordship; but by 1090 the Normans had firmly established their rule. The cathedral of Catania was founded in 1090 by the great Norman count Roger I. In 1126 the relics of Saint Agatha were brought back to the city from Constantinople, where the Greek general George Maniakes had taken them a century earlier. Catania was generally loyal to the Normans and so earned the hostility of the German conqueror Henry VI, who ordered a sack of the city in 1194. Frederick II built the massive Castello Ursino to consolidate his hold over Catania; apparently, his rule had been shaken by trouble in the city in 1232. However, Catania was loyal to the Hohenstaufen in their struggle with the Angevins, and to the Aragonese after the revolt called the Sicilian Vespers in 1282. In 1296, a parliament at Catania elected Frederick of Aragon king of Sicily. Catania remained loyal to the Aragonese in 1354, when much of the island had been invaded by the expeditionary force of Nicola Acciaiuoli, grand seneschal of the Angevin rulers of Naples. The city was also the scene of dramatic events in 1379, when Artale d'Aragona, a great power in Sicily, held the heiress Maria of Aragon captive in the castle, from which she was spirited away by his rival Raimondo di Moncada. Maria eventually returned victoriously with Martin of Aragon (Martin I of Sicily, r. 1392-1409), whom she had subsequently married. This alliance led to the incorporation of Sicily in the lands ruled by the kings of Aragon from Spain; King Martin then summoned a parliament at Catania to recover the lost rights of the

crown.

In the fifteenth century, Catania was the seat of parliaments under the auspices of Alfonso V of Aragon (d. 1458). During this period it was also the seat of a university and had a significant Jewish community. Its rivalry with Palermo became bitter, and Catania was also a focus of social unrest, especially between 1435 and 1451, when popular factions secured representation on the city council.

Little of medieval Catania survives, because of an eruption of Mount Etna in 1669 and an earthquake in 1693. Parts of the cathedral are a reminder of the city's medieval past, but the rest of the town is mainly eighteenth-century and later.

Catasto

The Greek *katastichon* ("list") is the root of the Italian term *catasto* (also *cadasto*, *catastro*, *catastico*), which refers to a type of tax based on inventories of personal and real wealth. Originally, *castato* referred to the list of taxable goods and property, but then it became the name of the tax.

The *castato* was used in ancient Egypt, Greece, and Rome and was revived in Italian communes during the twelfth century, a period when civic needs and private wealth were both increasing. In 1162, Pisa initiated the earliest known medieval Italian *catasto*. The communal consuls named five men from each quarter of the city and gave them a month in which to list all the inhabitants. Each family then had three months in which to submit a list of all taxable property, real and movable. The five then evaluated each family's wealth and calculated the family's share of the quarter's tax burden. Similar procedures developed in Siena between 1168 and 1175, Lucca in 1182, Florence in 1202, Genoa c. 1214, and Volterra in 1217. The Lombard communes lagged somewhat behind Tuscany; Milan adopted legislation in 1211 but did not establish the process until 1240 and did not begin collecting data until 1243. Perugia used the similar *libra* in 1260 and 1285. In Florence, the *estimo*, a tax on real property alone, was replaced in 1427 with a fuller *catasto* for the city and all its territory. Today, these *catasto* lists are rich sources for economic and social historians of the Italian cities and countryside.

Cathars

The Cathars were a heretical sect, professing neo-Manichaean dualism, that flourished in northern Italy, southern France, and the Rhine region during the twelfth and thirteenth centuries. The name Cathar is derived from the Greek *katharos*, "pure." It was applied to the group from at least the 1160s. Other names for them include Bogres, Gazari, Bulgari, and Albigenses. Cathar belief is traced to the Bogomils of the Balkans, who held a moderate dualism emphasizing the total incompatibility of body and soul, matter and spirit. God, the principle of good, had created the spiritual world; Satan, a rebellious angel, had created the

world of matter. Satan's power was inferior to that of God, but Satan had imprisoned many angels in matter, thus creating the world's living creatures, including human beings. The trapped angels could free themselves from their corporeal cages only through ascetic practices that would render them perfect and thus incapable of transmigration to still another body after death. The Bogomils rejected the church, its sacraments, and the legitimacy of its priesthood. They considered Jesus neither God nor a savior, but merely a human being. They accepted the authority of the New Testament but interpreted it in a highly symbolic way, and they rejected the Old Testament entirely.

Bogomil missionaries may have had some success in Italy and France as early as the first decades of the eleventh century. As Bogomil doctrines spread, they were altered, and by the late 1100s—about the time when the Bogomils' converts were being called Cathars—a type of dualism emerged in southern France that ascribed to Satan power equal to God's. This radical strain of Catharism became very popular in France, although it was resisted by Italian Cathars. Doctrinal disputes such as this led to many schisms among Cathars, especially in Italy. Nevertheless, a certain order was maintained by a kind of hierarchy roughly similar to that of the church. "Perfects," those who had undertaken a life of rigorous asceticism designed to free their souls from corporeal imprisonment, were given the authority of teachers and were able to create "bishops" and "deacons"; other Cathars were called "believers." The perfects emphasized obedience, administered a rite of initiation (*consolamentum*), and supervised a ceremony of public confession (*apparellamentum*).

By 1200, Cathars were widespread in northern Italy and southern France. Their centers of activity in Italy were Milan, Piacenza, Cremona, Bergamo, Brescia, Verona, Vicenza, Ferrara, Florence, Rimini, and Orvieto. In France, the Cathars were concentrated between Carcassonne and Toulouse. Attempts by the clerical authorities to suppress the sect had been sporadic and generally unsuccessful during the twelfth century, but this situation changed with the election of Innocent III to the papacy in 1198. Innocent put heavy pressure on lay and ecclesiastical authorities in both regions to take action. When he encountered resistance in the south of France, he sent his own preachers into the region, replaced recalcitrant clergy, and threatened

lay leaders with spiritual and temporal penalties. The assassination of a papal legate in 1208 prompted Innocent to call a crusade against the Cathars of southern France. The crusade was only partly successful: it unseated political leaders who were unwilling to prosecute heretics, but it also drove Catharism underground. To destroy the sect, Innocent's successors turned to the preaching of the mendicant orders and to the Inquisition, which Pope Gregory IX inaugurated in 1233. By 1250, the tribunals of the Inquisition, the preaching of Franciscans and Dominicans, and continuing religious warfare had considerably reduced the Cathar population of southern France.

Cathars flourished in Italy until late in the thirteenth century, primarily because the pope's inquisitors were kept out of cities dominated by the antipapal Ghibellines. But the fortunes of the Cathars declined with those of the Ghibellines. By the 1280s the Inquisition was permitted to operate in most cities; at about the same time, the Cathar hierarchy crumbled. The last Cathar bishop was captured at Milan in 1321. A few decades later Catharism was virtually extinct in western Europe.

Catherine of Siena, Saint

Saint Catherine of Siena (Caterina di Iacopo di Benincasa, 1347-1380) was a significant force in the Italian church and Italian society of the late fourteenth century. Catherine was the twenty-fourth of twenty-five children of a Sienese wool-dyer. She adopted a fierce asceticism in early childhood, determined never to marry so that she might belong entirely to God. In her late teens she was admitted into the lay third order of Saint Dominic, which until then had been composed only of widows. Thereafter she lived in almost total seclusion in her parents' home until, when she was about twenty years old, she experienced a dramatic conversion: her prayers led her to the realization that her love for God could no longer be detached from service of others.

Catherine then began to work with the poor and sick of Siena, but her influence soon extended to the civic and ecclesiastical spheres as her powerful personality and her gift for conciliation were recognized. She attracted disciples, many of whom were her seniors in age and her superiors in education and status. She found an ideal mentor—intellectually, spiritually, and politically—in the Dominican Raymond of Capua, who in 1374 was appointed by the Dominican order (an appointment later confirmed by the pope) to be her confessor and the director of her public activities. In partnership with Raymond, she

became deeply involved in attempts to mediate and resolve the growing tension and rifts between the republics of the Italian peninsula and the Avignonese papacy. This conflict was basically political, but because it threatened the unity of the church, it represented for Catherine a religious crisis in which she repeatedly felt compelled to intervene. Her efforts took her to Pisa, Lucca, and Florence and eventually to Avignon, where in 1376 she persuaded the hesitant Pope Gregory XI to return with his curia to Rome. However, her own political naivete, when Raymond was not actually at her side, often complicated matters, and her realization of this fact was a heavy psychological burden to her.

Catherine passionately promoted Gregory's projected crusade against the Turks, convinced that the venture would not only unite the rebellious republics with the pope in a common defense of Christian lands but would also bring converted Muslims into the church as a leaven of needed reform.

After Gregory's death on 27 March 1378, a tumultuous election brought to the papal throne Urban VI. Urban's violent ways soon caused the majority of the cardinals to disavow him and elect an antipope, Clement VII, thus bringing about the Great Schism. Catherine, however, considered Urban the legitimate pope and supported him vehemently, even while urging him to moderation. At his invitation she moved with a number of her disciples to Rome in

November 1378, to support his cause. By this time, however, her health was failing as a result of her extreme asceticism. (Her early patterns of fasting had led to an inability to eat normally, which she regretted but was unable to reverse.) In addition, the apparent failure of her dearest causes became a crushing load that she actually felt as a physical weight. Still, she continued to preach, write, pray, and fast in defense of the church's unity until she became totally disabled early in 1380. She died on 29 April of that year.

Though unschooled, Catherine had learned to read during her years of solitude. At some later time, she probably learned to write, but she usually found dictation a more efficient vehicle for her prolific mind. Several of her disciples served as her secretaries, and to them we owe the preservation of her letters, a book, and a collection of her prayers.

From the early 1370s on, nearly until she died, Catherine wrote a vast number of letters to counsel others and to influence them in favor of her causes. To date, 382 of her letters have been discovered and published. They are addressed to a remarkably wide variety of her contemporaries: two popes, several cardinals and bishops, two kings, two queens, numerous lesser public officials, her religious and lay associates, her family and friends, her disciples, and an assortment of others, including allies and opponents, a mercenary captain, a prostitute, a homosexual, and the prisoners of Siena. Unfortunately, the early compilers of these letters were intent on edification and sometimes on maintaining confidentiality, and so they deleted much of the personal content. But even abridged, the letters provide a window onto Catherine's evolving thought and personality and onto the history and culture of her age. They are particularly interesting because her activities extended so far beyond the normal bounds for a woman of her time and of her status in church and society.

During an eleven-month period in 1377 and 1378, in addition to her missions of mediation, Catherine composed a book that came to be known as *The Dialogue* (*Il dialogo*) because she cast it as a conversation with God. Her purpose in writing it was to share with her disciples and others the insights into Christian life that she had gained from her own prayer and experience. Also, during the last few years of Catherine's life, her secretaries often recorded her words as she spoke aloud in ecstasy. Twenty-six such prayers have been preserved.

The volume by Dupré Theseider (1940) is the only truly critical edition of Catherine's letters. At the time of the present writing, his work was being continued by Antonio Volpato, but further volumes had not yet been published. Letters and fragments of letters discovered more recently can be found in Dupré Theseider (1931), Fawtier (1914), Gardner (1907), and Motzo (1911). Critical editions of Catherine's other works are those by Cavallini (1968, 1978).

Catherine's works were among the earliest disseminated (and printed) in the Italian vernacular, and she was the first woman to produce extensive work in that vernacular. Because she used the Sienese dialect, her writings became important (through the works of Girolamo Gigli) in the eighteenth century, when various Italian dialects were contending for supremacy.

Critics have offered varying assessments of Catherine's genius and her importance in the history of Italian literature. Most of their analyses have concentrated nearly exclusively on her letters in preference to her other works. Her style is oratorical but spontaneous and unstudied; probably, she never proofread most of her letters. Her thinking drew heavily on the Bible and on preaching, conversation, and her own reading. There are clear strains in her thought of the ideas of, among others, Augustine, Gregory the Great, Bernard de Clairvaux, Thomas Aquinas, and especially her near contemporary Domenico Cavalca. While she does not add any really new link to the content of theological tradition, she does bring a refreshing new synthesis that is markedly pastoral and strongly based on experience. For clarification, she resorts less often to conceptual argumentation than to everyday images, which, over the years, she develops individually and interweaves.

Catherine was canonized in 1461. In 1939 she was proclaimed patron of Italy, with Saint Francis of Assisi. In 1970 Pope Paul VI named her a doctor of the church, a title that she and Teresa of Avila are so far the only women to bear.

Cava Dei Tirreni

According to tradition, Cava was identified with the ancient Tyrrhenian city of Marcina, which was actually farther to the east and was the port of entry to the Gulf of Salerno; Marcina was destroyed in the fifth century by Genseric (Gaiseric, king of the Vandals). The

beginnings of Cava itself may be traced to 1111, when the fortress of Saint Adiutoris was feudally attached to the monastery of the Holy Trinity (Santa Trinità), which controlled the surrounding regions. Under the patronage of the monastery, the city grew as an important base for merchants active in Lucania. In the late fourteenth century it came briefly under the control of King Ladislaus of Naples, who was granted the title of abbot-bishop by Pope Boniface IX in 1394.

The abbey of Cava takes its name from its construction over a cave or crypt (*caved*) in the porous rock. According to a local source (*Chronicon vultumense*), the abbey was founded in 1011, on the site of an earlier holy place, by the hermit monk Alferio (d. 1050), around whose cell a cenobitic monastery was constructed. It is first referred to as Most Holy Trinity (Sanctissima Trinità) in a document of Guaimar III of Salerno (1025) addressed to Alferio as abbot.

The abbey received numerous donations and grants exercised in feudal terms and became one of the most powerful monasteries in southern Italy, even though the Byzantines were opposed to any grand expansion of monasticism. It accepted the reform movement of Cluny, and its third abbot, Peter I, numbered among his disciples Pope Urban II. Under subsequent Lombard, Norman, and papal patronage, it received still further donations and proprieties. Attempts by Frederick II to reduce the jurisdictional power of the abbey were continued under the Angevins; such efforts facilitated inroads on the abbey's holdings by its neighbors. As a result of increasing secularization, redefinition of the monastery as a bishopric (in 1394), and further disruptions of its institutions, the abbey became impoverished and virtually extinct by the fifteenth century.

Although little survives of the original edifice, the Baroque rebuilding is impressive, and the present abbey houses important collections of art objects, coins, manuscripts (eighth to nineteenth centuries), and incunabula.

Cavalca, Domenico

Domenico Cavalca (c. 1270-1342) was born at Vico Pisano. He became a Dominican and spent most of his life serving his order in Pisa, where he came to have a great reputation for saintliness and was also an active preacher and an administrator of religious houses. Shortly before his death, he founded a convent to shelter converted prostitutes.

Florence: Nicolaus Laurentii, Alamanus 1476-1477. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Cavalca was a prolific and versatile writer. Although he left a body of vernacular poetry in several genres (sonnets, *laudi*, *sirventesi*), his major contribution as an author was to the development of vernacular prose, of which he is one of the earliest recognized masters. Much of his work consists of translations (*volgarizzamenti*) adapted from Latin

originals and intended for an audience that was literate only in the vernacular: these include versions of the *Dialogue* of Gregory the Great, the *Summa virtutum et vitiorum* (*Encyclopedia of Virtues and Vices*) of William of Auxerre, and the Acts of the Apostles, and a large hagiographic collection, *Vitae patrum* (*Lives of the Fathers*), which is often acclaimed as his masterpiece. Cavalca's original work in the vernacular, most if not all of which appears to date from after 1320, includes sermons and numerous treatises on moral, spiritual, and mystical themes. It includes *Specchio della croce* (*Mirror of the Cross*), *Specchio dei peccati* (*Mirror of Sins*), *Pungilingua* (*Stinging Tongue*), *Mondizia del cuore* (*Purity of Heart*), *Frutti della lingua* (*Fruits of the Tongue*), *Trattato delle trenta stultizie* (*Treatise of the Thirty Foolishnesses*), and *Disciplina degli spirituali* (*Discipline of the Spiritual*). In all his work, Cavalca handles the vernacular with dexterity and emotional force; and his narrative technique, especially in his elaboration of moral or spiritual *exempla*, stands up well to the inevitable comparison with his great secular near-contemporary, Boccaccio.

Cavalcanti Family

The Cavalcanti were one of the leading noble families of Florence. They held the castles of Ostina and Luco in the upper Arno valley, Montecalvi in the Valdipesa, and Le Stinche (after which the famous Florentine prison was named) in the Valdigreve. Within Florence, their branches congregated in the *sesto* of San Piero Scheraggio near the Mercato Nuovo. As early as 1176, Cavalcante dei Cavalcanti served as a Florentine consul; his descendants became leaders in the Calimala guild and members of the guild of Por Santa Maria. As prominent merchants, and later bankers, the Cavalcanti married into Florence's elite families and created a broad social and political network.

As important Guelphs, the Cavalcanti were exiled in 1248 after the unsuccessful uprising that followed the imposition of Frederick of Antioch, and again in the wake of the Ghibelline victory at Montaperti (1260). When they returned in 1266, they found that much of their property had been destroyed. In the 1290s, the family feuded with the Buondelmonte clan; as a result, the Cavalcanti were excluded from Florentine government in 1293. Because of their hatred for the Donati family, many of the Cavalcanti joined the White party; this connection resulted in the loss of Le Stinche (1304) and the further destruction of much family property after the Blacks' victory. In 1312, after the murder of a rival Pazzi, houses and businesses of the Cavalcanti were wrecked, and much of the family went into exile. During their exile, they decided to support Emperor Henry VII in his Italian campaign. After a reconciliation in 1316, the Cavalcanti continued to play active roles in government, and they were associated with most of the important political events in Florence during the *Trecento*. In the later 1300s,

during the agitation against the magnates, many Florentine branches of the family changed their names and heraldry, and others established themselves in Naples. Nonetheless, in 1378 there were still thirty Cavalcanti households in Florence. Dante refers to his friend Guido Cavalcanti and to Cavalcante, who was Guido's father, in the *Commedia* (*Inferno*, 10.52-72).

Cavalcanti, Guido

The significant events in the life of the poet Guido Cavalcanti (c. 1255-1300) were inextricably bound up with the political tumult in Florence. Cavalcanti was born into a Guelf family that had established itself as one of the wealthiest and most powerful clans in Florence. In 1267 he married a daughter of Farinata degli Uberti, head of the Florentine Ghibellines, a political arrangement intended to promote peace between Guelf and Ghibelline factions. A force in Florentine politics, Guido Cavalcanti served as a public guarantor for the Guelf party in a peace accord brokered in 1280, and as a member of the *consiglio generale* of Florence in 1284 and 1290. His political role in Florence ended abruptly in 1295, when the *ordinamento di giustizia*, an ordinance against magnates, was adopted. However, he remained engaged in the power struggle between factions of the Guelf party, and

he was held responsible for the assassination attempt of a rival, Corso Donati. In June 1300, Guido Cavalcanti was exiled from Florence for the sake of public tranquillity, but he was recalled shortly thereafter because of ill health, and he died in August of the same year.

During his lifetime, Cavalcanti was reputed to be a parsimonious, impetuous, and irascible; in the decades following his death, he became an icon of the aloof, intellectual urban aristocrat. Boccaccio, in the *Decameron* (6.9), describes Cavalcanti as one of the best logicians in the world and an outstanding natural philosopher, adding that Cavalcanti was a perfect nobleman: wealthy, eloquent, and accomplished. The *Decameron* introduced the notion that Cavalcanti was widely held to be an Epicurean who denied the immortality of the soul, although there is no historical evidence for this. Cavalcanti's interest in philosophy is borne out, however, in a philosophical tract dedicated to him in 1280 by Iacopo da Pistoia, a professor at the University of Bologna.

Cavalcanti was a pivotal figure in the development of thirteenth-century lyric poetry, and he is regarded by many modern readers as the finest lyric poet of the Italian *Duecento*. He firmly rejected, in terms more disdainful than Dante's, the heavily ornamented, conceptually curtailed poetry of Guittone d'Arezzo (c. 1235-1294). Cavalcanti's language combines intensity of expression with intellectual clarity, defining what Dante dubbed the *dolce stil nuovo*; his corpus of fifty-two poems is characterized by a highly subjective and intimate exploration of the experience of love. Cavalcanti's probing poetic voice became the inspiration for Dante's own youthful writing of love poetry in *Vita Nuova*, and in fact Dante dedicated this book to Cavalcanti. Later, though, there is ample evidence of rancor and ideological discord between the two poets.

The Bolognese Guido Guinizzelli (fl. mid-thirteenth century) influenced Cavalcanti's early sonnets written in praise of his lady. In the marvelous sonnet *Chi è questa che vèn ch'ogn' om la mira* ("Who is this who comes, upon whom every man gazes?"), Cavalcanti repeats the two rhyme words and four rhymes of Guinizzelli's *Io voglio del ver la mia donna laudare* ("I truly wish to praise my lady"). Yet even this early sonnet reveals significant deviations from its model. In the quatrains, Guinizzelli's poem describes a lady by using hyperbolic comparisons to natural beauty; in the tercets, her spiritually salutary effects on those in

her presence are recounted. Cavalcanti's poem turns on its own inadequacy: the impossibility of giving voice to the commotion he feels in the lady's presence, the ineffable quality of her beauty, and the incapacity of the mind to ascend to and comprehend the lady's splendor. The sonnet also differs from its model in the poet's detachment as he contemplates his lady, and in the universality of the effects ascribed to her beatitude. *Chi è questa che vèn* is characterized by many of the features that defined Cavalcanti's poetry throughout his career: a marriage of form and content; phonic lightness; rhythmic grace; supple syntax; subtle allusions to the Old and New Testaments (the opening line echoes the Song of Songs) and to other vernacular poets; and references to logic and science (the visible trembling of the air that creates a halo of light around the lady in line 2 is a phenomenon appropriated from the physics of sound). Personification, the most prominent characteristic of Cavalcanti's poetry, is present in the figure of Love, (Amor), who is charged with telling of the lady's gaze when the poet cannot. In other works, personification is accompanied by frequent apostrophes, as the poet appeals to his denatured heart or soul or spirits and begs that they, in turn, appeal to his lady.

Other poems develop the implications of Cavalcanti's paradoxical understanding of love poetry: since he is unable to sing of his lady, whom his mind cannot conceive or his words convey, his poems explore the fear, despair, anguish, and disorientation that result from the experience of love. Guittone d'Arezzo had equated love with a loss of reason and virtue, and even with death; Cavalcanti dramatizes the psychological disintegration and internal commotion caused by love, in sonnets like *Deb, spiriti miei, quando mi vedete* ("My spirits, when you see me"), *L'anima mia vilment' è sbigotita* ("My soul is so cruelly aggrieved"), and *Voi che per li occhi mi passaste 'l core* ("You who pass through my eyes to my heart"). In these poems the poet's heart, mind, eyes, sighs, soul, and spirits—vital vapors, according to the physiology of the time—are engaged in his plea for survival: some are sent to the lady to beg for mercy; others are described as helpless witnesses to the poet's crisis. *Noi sian le triste penne isbigotite* ("We are the sad and mournful pens") takes the process a step further: the languishing poet's writing tools are all that is left to plead to the lady.

Guido Cavalcanti sought to understand his experience of love in terms that transcended the literary and purely subjective. Gianni Alfani, his follower, jokingly refers to Cavalcanti as the only man who actually *sees* Love (*Ballatetta dolente*, 19), and lexical studies bear this out: *vedere* occurs fifty-five times in Cavalcanti's corpus; *guardare* fifteen times; *mirare* thirteen times; *sguardare* twice; *riguardare* once; *guatare* once; *occhi* thirty-one times; *sguardo* four times; *veduta* once, and *vista* once, according to Calenda (1976, 82-83). The eyes are, of course, the conduit for love; but perhaps more important for Cavalcanti was the fact that visibility represented the most concrete form of demonstration in Aristotelian natural philosophy. As the young Dante pursued the understanding and appropriation of the experience of love, he was profoundly influenced by Cavalcanti's poetic "research." In Chapter 26 of *Vita Nuova*, when Dante is finally able to define his poetry of praise as beatitude, and his *credo che* ("I believe that") becomes the more objective *pare che* ("it seems that," as in *Tanto gentile e tanto onesta pare* and the surrounding prose), Dante borrows essential elements from two of Cavalcanti's ballatas: *Posso degli occhi miei novella dire* and *Veggio negli occhi de la donna mia* (De Robertis 1961, 142-145).

The *ballata* was Cavalcanti's preferred form, and eleven of his *ballate* are extant. In contrast to the Italian *canzone*, which in the course of the *Duecento* became the form of choice for doctrinal poetry, the *ballata* was associated with music, dance, and—given its codification at the court of Charles of Anjou (Asperti 1995, 107-112)—perhaps a certain spirit of aristocratic hedonism. Cavalcanti may have preferred the asymmetrical musicality of the *ballata* or, as Calenda has suggested (115-117), may have consciously refused to engage in writing *canzoni*, which were becoming, with Guido Guinizzelli and Dante, ideological "manifestos" for the emerging bourgeoisie. In one of most famous *ballate*, *Perch'io no spero di tornar giammai* ("Because I do not hope ever to return"), Cavalcanti expands the expressive potential of the recurring rhyme, engaging it in conversation with the stanzas, as the writer Ugo Foscolo (1778-1827) pointed out. This poem was long thought to be an autobiographical final appeal to his lady from afar, by a poet fearing his imminent death; but Calenda (33-52) has shown that the work actually represents a *summa* of the poet's themes and stylistic

elements.

An important achievement in Cavalcanti's hendecasyllabic *ballate* is his fluid, natural elaboration of ideas within the stanza. This presents a marked contrast to the more "scholastic" use of conjunctions of coordination and subordination to develop ideas, in *canzoni* like Guinizzelli's *Al cor gentil rempaira sempre amore* ("Love makes its home in the noble heart"). De Robertis points to this as a major accomplishment of the *dolce stil nuovo*, and an essential lesson that Dante learned from one of his first friends (134-135).

Of the two extant *canzoni* by Guido Cavalcanti, one, *Donna me prega*, is regarded as the most difficult in the Italian language. It has been interpreted from numerous perspectives, although a strictly neo-Aristotelian interpretation in line with contemporary teaching at the universities of Bologna and Paris now seems to prevail. *Donna me prega* represents a significant departure from the dramatic form of Cavalcanti's other poems. The work offers a philosophical and scientific presentation of the essence of love, how love manifests itself, and what its effects are; the questions are divided into eight topics, two of which are treated in each of the four remaining stanzas. The structure of the poem is tightly controlled, and internal rhymes enhance the rigor of the *canzone*.

Cavallini, Pietro

The painter and mosaicist, Pietro Cavallini (fl. c. 1270-c. 1330) is generally considered the most important Roman artist of his day and one of the protagonists in the revival of the visual arts in Italy during the late *Duecento*. His art, which is characterized by vivid naturalism, is a masterful synthesis of contemporary Byzantine and northern European styles and iconography with the artistic traditions of classical and early Christian Rome. Evidently much admired and sought after, Cavallini worked for most of his life in Rome. There, beginning with the papacy of Nicholas III (r. 1277-1280), the recently consolidated power base of the popes offered him significant opportunities for employment. He was also active in Naples, where he worked for the

Angevin king Charles II; and, as is sometimes argued, possibly in Assisi. Some scholars (though they are in the minority) maintain that Cavallini was the principal master of the fresco cycle *The Legend of Saint Francis*, traditionally attributed to Giotto, in Assisi. Whatever the truth may be regarding Cavallini's supposed links with Assisi, Giotto—who was younger than Cavallini and whose known career began when Cavallini had already reached artistic maturity—was probably inspired by and indebted to Cavallini's innovative work.

Cavallini's known career in Rome and Naples: c. 1273-1325. Cavallini's career is sparsely documented, but some details about his life and work were included in Lorenzo Ghiberti's *Commentarii* (mid-1400s) and Giorgio Vasari's *Vite* (1550, revised 1568). Cavallini was a member of the noble de' Cerroni family (if the notarial act of 1273 is in fact a reference to him). He is believed to have been active from the 1270s to the 1280s as a fresco painter in the venerated Roman basilica San Paolo fuori le Mura. This work, his earliest known commission, was destroyed in a fire in 1823. The general appearance of the paintings, however, can be seen in surviving copies, most notably in watercolors executed for Cardinal Francesco Barberini in 1634. The subjects were episodes from the Old Testament (on the south wall of the nave); and scenes from the New Testament, with particular emphasis on Saint Paul, patron of the basilica (on the north wall). It would appear that Cavallini largely restored or at most reworked a vast fifth-century fresco cycle. This experience, however, would have given him a valuable opportunity to study early Christian iconographic traditions and principles of design, and possibly to study techniques of late antique painting as well.

Cavallini's skill as an artist is manifest in somewhat later fresco work that is extant: fragments in the Roman church of Santa Cecilia in Trastevere. This cycle was partially destroyed in the eighteenth century and rediscovered in the early twentieth century; it is generally dated to c. 1293, the year the Tuscan sculptor Arnolfo di Cambio signed and dated the *ciborium*, which apparently formed part of a wider scheme of redecoration in which Cavallini was intensely involved. According to Ghiberti, the frescoes once filled the whole interior. The surviving frescoes depict the Last Judgment on the entrance wall and episodes from the Old and New Testaments on the side walls. Cavallini's style,

especially evident in the solemnly enthroned apostles in the Last Judgment, is characterized by a remarkable sensitivity to the properties of light, which are fully exploited in order to define the volumetric forms of figures wrapped in weighty but soft expanses of fabric. Another aspect of this sensitivity is an expressive play of color, made possible by the artist's ability to create subtle transitions in tone; these transitions are particularly striking in the seraphim in the Last Judgment. The iconography of the frescoes in Santa Cecilia would have been considered innovative by Cavallini's contemporaries: these frescoes blend Byzantine iconographic traditions—highly structured and symmetrical Last Judgment schemes—with a recent French practice of depicting the apostles with the symbols of their martyrdom.

Cavallini's work in Santa Maria in Trastevere is also extant. Both Ghiberti and Vasari recorded Cavallini's activity in this church, where a mosaic cycle depicting six episodes from the life of the Virgin and a central donor panel survive. The work, generally dated to the 1290s, once bore the artist's signature in the dedicatory panel, which could still be read in the seventeenth century. Each framed scene carries Latin verses that were composed by Cardinal Giacomo Gaetano Stefaneschi, brother of Bertoldo Stefaneschi, the patron of the project. Although Cavallini was working in a different medium, he managed in these mosaics to evoke the refined effects in lighting that he had produced in the frescoes in Santa Cecilia. Furthermore, the design of each episode in the mosaics is informed by monumental clarity. In the Presentation in the Temple, for example, human figures that express great tactile power are rhythmically positioned in front of and around architectural features that define and create space.

According to Vasari, Cavallini's masterpiece in Rome was a fresco cycle in the apse of Santa Maria in Aracoeli (c. 1298). These frescoes were destroyed in the second half of the sixteenth century. However, Cavallini executed another fresco cycle for the same church; it included a Virgin and Child between Saints, surviving fragments of which were discovered in 2000 in the chapel of San Pasquale Baylon. The fragments are imbued with a classical monumentality and, through skillful handling of chiaroscuro, also convey a pronounced plasticity. Other Roman works convincingly attributed to Cavallini on the basis of style and technique include a fresco over the tomb of Cardinal Matteo

d'Acquasparta in Santa Maria Aracoeli (c. 1302) and a fresco in the apse of San Giorgio in Velabro (possibly late 1290s).

In 1308 Cavallini was lured to Naples by King Charles II, who offered him a yearly salary of thirty ounces of gold with a further two ounces to maintain a house. Fresco fragments associated with Cavallini, his workshop, or his immediate followers that survive there exhibit the monumental design principles and atmospheric subtlety of his Roman works. The frescoes in Santa Maria Donna Regina (c. 1320), for example, manifest a rigorous understanding of form, a profound characterization of the figures, and continued experimentation with lighting effects.

Critical reception and posthumous reputation. A marked decline in Cavallini's reputation began in the sixteenth century, when Vasari claimed that Cavallini had been a pupil of Giotto; this notion, reflecting the general line of argument in Vasari's *Vite*, supported the idea of the superiority of Tuscan art. The falling-off of Cavallini's stature was exacerbated by the gradual destruction of his work, especially in the wake of the Counter-Reformation, when many churches in Rome were remodeled or refurbished.

The discovery of the frescoes in Santa Cecilia in 1900 revived interest in Cavallini, since Vasari's chronology was no longer considered tenable. Through the twentieth century, scholars restored Cavallini's reputation and emphasized his role as a the pioneering figure in the history of early Italian art. The discovery of the frescoes in Santa Maria Aracoeli in 2000 brought about another new wave of interest in and debate about Cavallini, late *Duecento* Roman art, and the attribution of the frescoes in the upper church at Assisi.

Cecco Angiolieri

Cecco (c. 1260-1312) is the most prolific and best-known of the medieval comic poets. His father, Messer Angioliero, was the banker of Pope Gregory IX from 1230 to 1233, a member of the Frati Gaudenti, and a prominent Guelph who participated in the political life of Siena. Cecco belonged to the Arte del Cambio, i.e., the money changers' or money brokers' guild. He served as a soldier in the Sienese militia in 1281, in a siege of the castle of Turri in Maremma (during which he was fined for arbitrary absences while the fighting was going on); and in 1288, in a campaign against Arezzo (during which he was fined for violating a curfew). It appears that Cecco was plagued with financial problems throughout his lifetime. In 1302 he sold a vineyard. After his death, his five children were made to renounce their inheritance and to pay additional monies to the commune in order to satisfy his debts.

Cecco's *canzoniere* are the largest body of work by a thirteenth-century comic poet, consisting of 112 sonnets of undoubted authorship and fourteen sonnets whose attribution is dubious. Questions of authenticity of authorship preoccupied many scholars in the past,

especially because Cecco's style had set a tone for many subsequent comic poets. Until 1914, the entire corpus of poetry by Meo dei Tolomei (c. 1260—c. 1310) was attributed to Cecco, as were two sonnets by Nicola Muscia (late thirteenth century). Many of Cecco's poems are found in MS Chigiano L.VIII.305 of the Vatican Library; smaller groups are found in Escorialense e.III,23 and Vaticano Barberino Latino 3953. Many other codices contain one or two sonnets by Cecco, attesting to the widespread popularity of his poetry during his lifetime. However, the manuscript tradition also indicates that his popularity did not extend much beyond his own generation.

Cecco's best-known and most frequently anthologized sonnets— *Tre cose solamente mi so' in grado* and *S'i' fosse foco, ardere' il mondo*—are in the Goliardic tradition (the Goliards were wandering entertainers) of odes to wine, women, and gambling; however, these sonnets are not indicative of the bulk of his *canzoniere*. A significant number of Cecco's sonnets recount a stormy relationship with a woman named Becchina, characterized by some scholars as an "anti-Beatrice" because her earthy language and behavior contrast sharply with the type of idealized, angelicized woman portrayed by Dante and other poets of the *dolce stil nuovo*. Of particular interest are the sonnets in dialogue between the poet-lover and Becchina, such as "*Becchin'amor!*" "*Che vuo, falso tradito?*" and "*Becchina mia!*" "*Cecco, nol ti confesso.*" In these compositions Cecco raises the traditional *sonetto a dialogo* to a new level of artistry. By having both figures speak in each line, he accelerates the pace, thus heightening the theatrical and comic effect. Most of the love sonnets that revolve around Becchina have as their theme two moments in the relationship: the poet's initial frustration in getting her to accept him as a lover; and, after the relationship has ended, his despair at losing her.

One reason cited by the poet for his inability to win Becchina back is his constant lack of money. The cause of the poet's poverty is his avaricious father, the subject of many of Cecco's sonnets written in the vituperative tradition of medieval comic poetry. In *Sed i' credesse vivar un dì solo, I ho un padre sì compressionato, Sed i'avesse mille lingue in bocca*, and other sonnets, the poet describes his father's stinginess in hyperbolic terms and fears that the old man will live forever, thus preventing his son from ever inheriting his money.

The anti-paternal theme, unique to Cecco, gives rise to a series of sonnets about the power of money and the misery of the poor. According to sonnets such as *Così è l'uomo che non ha denari* and *Quando non ho denar, ogn'om mi schiva*, those who find themselves thrust into poverty discover that their friends desert them and that people point to them as objects of derision. Cecco's ingenious use of hyperbole results in a sonnet in which the poet is so poor that he has pawned his smiles (*Per sì gran somma ho 'impegnate le risa*).

From the sonnets on poverty it is a short jump to sonnets written in the gnomic-moralizing tradition, in which the values and institutions of society are viewed as corrupt. Typical of this group are *Senno non val a cui fortuna è cònta* and *Egli è sì poco di fede e d'amore*.

Although many scholars have interpreted Cecco's poetry as autobiographical, it is important to keep in mind that his themes are deeply rooted in medieval literary tradition, and that his style attests to a thorough knowledge of the medieval arts of composition, *artes dictandi*.

Cecco D'ascoli

The physician, poet, and astrologer, Francesco Stabili, known as Cecco d'Ascoli (1269–1327), was born in Ancarani, near Ascoli Piceno in the Marches. At age fifteen he attended medical school in Salerno. He continued his training in Paris and later became a lecturer in medicine at the University of Bologna. In 1324, he was suspended from teaching after having been accused of heresy by the inquisitor Lamberto da Cingoli. In 1326, he was in Florence in the service of Charles, duke of Calabria, and became Charles's personal physician and astrologer. Cecco's troubles in Bologna, however, followed him to Florence, where he made some powerful enemies. Dino del Garbo, a renowned Florentine physician, conspired to ruin him. The pretext for Dino's animosity was Cecco's belief that the birth of Christ had been foreshadowed by the stars, but historians have speculated about the actual reasons for the conspiracy. Were the Florentine doctors envious of Cecco's professional success, or were they truly opposed to his scientific beliefs, which he promoted in his widely read commentaries on important astrological treatises? At the same time that Dino was

conspiring against him, Cecco fell out of favor with his patron, Charles; according to a contemporary, the Florentine chronicler Giovanni Villani, Cecco had predicted that Charles's daughter Giovanna would lead a lascivious life. Undermined by envious intellectuals and doctors, abandoned by his protector, and faced with a prejudicial case against him, Cecco was convicted of heresy and sentenced to death; he was burned at the stake on 16 September 1327.

Cecco d'Ascoli was renowned for his Latin commentaries on John of Hollywood's *Spera mundi* and on the *De principiis astrologie* of the Arab astronomer Alcabizio, as well as for his tract *Prelectiones ordinarie astro logic habite Bononie*. Today, he is best remembered for his doctrinal or didactic poem *Acerba*, with its polemic against Dante. The title *Acerba* may be derived from *cerva* (a doe) and thus may be an allegorical allusion to love, in this case a love of science and knowledge. However, a more plausible etymology is that *Acerba* derives from the Latin *acervus*, meaning a compendium of various topics.

Acerba consists of five books, the last of which was left unfinished at the poet's death. Each book is divided into short chapters containing strophes of six hendecasyllables. The first book (9 chapters) is a disquisition on astronomy and cosmology. The second (19 chapters) deals with the relationship between ethics and astrology. Whereas Dante sees Fortune as an angelic intelligence who distributes her gifts unpredictably, Cecco believes that human beings can alter their own fate through the proper exercise of free will. In the third book (18 chapters), the poet describes his moral bestiary: each animal or gem corresponds to a spiritual inclination and a moral belief. In the fourth book (12 chapters), the author uses the dialogue form to underscore the relationship between the natural world and the moral life of human beings. In a famous passage (4.13, 1-6), Cecco criticizes Dante for having used fiction to speak about divine matters:

*Qui non si canta al modo delle rane
qui non si canta al modo del poeta
che finge imaginando cose vane',
ma qui resplende e luce onne natura
che a chi entende fa la menta leta.
Qui non si gira per la selva oscura.*

("Here one does not sing like the frogs, here one does not sing like the poet who imagines false things and sets them forth, but here all nature shines and sheds light such that the minds of those who hear are gladdened. Here one does not go through the dark wood.") At first glance, Cecco's position against fiction appears similar to that of orthodox clerics who opposed popular fictional representations of theological issues. In reality, Cecco argues with Dante from a completely different perspective. The mysteries of the universe can be explained by a profound understanding of nature. The moral life, moreover, does not require belief in a transcendental figure. Cecco denies neither the existence of God nor the importance of divinity in the universe. He simply asserts that knowledge about the world humans inhabit can help them lead an ethical life.

With the exception of few passages, *Acerba* is aesthetically uninspiring and prosaic. Scholars read it primarily as an example of *Trecento* didactic poetry and for the polemic concerning Dante. They would do better, however, to give greater consideration to this poet's life and work. For one thing, even his adversaries respected his intellectual courage and conviction. He was, moreover, an unorthodox and profound thinker whose secular views represent an important strand in the intellectual history of the early *Trecento*.

Cecco Nuccoli

Cecco Nuccoli (bom c. 1290, fl. c. 1320-1350) was a Perugian notary and lyric poet. He is the author of twenty-nine sonnets (including eighteen *sonetti caudatt*), several of them in *tenzoni* with Perugian contemporaries (among them Marino Ceccoli and Gilio Lelli). The texts are preserved in a single source, MS Vaticano Barberiniano 4036 (which dates from 1345-1353). Many are in the thematic and stylistic register of *poesia giocosa* (comic verse), dealing humorously with urban low life and amorous adventures in a vivid and obscurely allusive style; but perhaps more interesting, and certainly more substantial, is a group of thirteen love sonnets, wholly serious in tone and undeniably accomplished in execution, addressed to Nuccoli's fellow-poet Trebaldino Manfredini. Though dismissed by some authoritative critics as lubricious and trivial, these poems in fact exploit existing conventions with remarkable skill in their moving and authentic evocation of love between men.

Cefalù

The name of the city of Cefalù, in Sicily, derives from the Roman Cephaloedum, referring to head-shaped rock on the northeastern coast around which the evolving town clustered. Scattered megaiithic remains testify to a prehistoric settlement on the site. In its Greek period, Cefalù was held at times by Syracuse, but in 211 it provided aid to the Romans in their siege of that city.

Only after long sieges in the ninth century did the city capitulate to the Arabs. In 1063 it was taken by the Normans under Count Roger. His son Roger II reestablished Cefalù as a seat of a bishopric and, it is said, vowed during a storm at sea to build a great cathedral there if he survived. This building, dominating the upper town at the base of the great rock, is the city's glory. It was begun in 1131 by Roger II, who apparently intended to make it his own and his dynasty's sepulchral church; he commissioned two porphyry sarcophagi for that purpose. However, this plan was altered by Frederick II, who transferred the sarcophagi to the cathedral in Palermo.

The cathedral of Cefalù was not completed until the following century; its facade, crowned by two towers, dates from 1240. Its atrium was built still later, in 1471. The exterior stonework of the cathedral is handsomely decorated in the characteristic Arab-Sicilian style. The nave and transepts, although they incorporate interesting Roman materials in their structure, preserve little decoration other than a few scant surviving frescoes. The presbytery, however, is a blaze of glorious Byzantine-Norman mosaic. The ensemble is dominated by an awesome portrayal of Christ Pantocrator, above images of an orant Virgin with four archangels, in turn surmounting a band showing the twelve Apostles. These mosaics, dating from 1148, are among the earliest and most splendid evidence of the transfer of Byzantine iconography and artistic techniques to Norman Sicily. Subordinate mosaic representations of patriarchs, prophets, saints, and angels date from somewhat later—they were created under William I (r. 1154-1166)—but are also fine.

Atop the rock that gave Cefalù its name are remains of a medieval castle, which was used at times as a prison. The present town preserves

its historic character and picturesque charm and is a popular tourist and resort center.

Celestine V, Pope

Pope Celestine V (Pietro da Morrone, c. 1209 or 1210-1296, r. 1294) was born in the region of Molise in central Italy; the precise place is probably Sant' Angelo Limosano, a small rural community. After being introduced to monastic life, Pietro (or Peter) became a hermit in the early 1230s, living in the Apennines of Abruzzo, notably on Mount Maiella and Mount Morrone. His fame as a miracle worker attracted a constant stream of visitors, and his holiness drew many followers to him. He needed to obtain ecclesiastical approbation for his community and followers, and this was granted in 1263 or 1264 by Pope Urban IV, who incorporated the Celestines into the order of Saint Benedict. To ensure the stability of the new congregation, Pietro went to Lyon and obtained a confirmation from Pope Gregory X in 1275.

By the 1290s, Pietro had founded or effectively controlled dozens of

monasteries, mainly in the central part of the Italian peninsula. In 1293 he established the seat of the order at the new abbey of Santo Spirito del Morrone, near Sulmona; he himself lived in a hermitage on a mountainside overlooking the monastery.

This move occurred during an interregnum following the death of Pope Nicholas IV (4 April 1292) when the cardinals, divided between the Orsini and Colonna factions, could not agree on a new pope. Charles II of Anjou and others exerted pressure to help break the impasse, and on 5 July 1294, in Perugia, Pietro—by then an octogenarian—was unexpectedly and unanimously elected pope. Although Pietro was known to some important clerics and secular leaders, he was probably selected not for his qualities or potential qualities as a leader but rather as a compromise candidate whose reign was not expected to be long.

Pietro was crowned Pope Celestine V in L'Aquila, the main city of Abruzzo, on 29 August 1294; he established an unusual indulgence that granted complete absolution to those who visited, under certain conditions, the church where he was crowned. Celestine appointed twelve new cardinals, gave the Franciscan Spirituals protection within the *Pauperes Eremitae Domini Celestini*, and granted many favors to his

monastic congregation; but it soon became apparent that he had little talent or inclination for his new tasks. When the Curia moved to Naples in November, Celestine considered renouncing the papacy and returning to his life as a hermit; he did so on 13 December 1294, after consultations with Cardinal Benedetto Caetani—who was elected Pope Boniface VIII eleven days later. Boniface, fearing that Pietro (as Celestine was now called again) might retract the abdication, sent emissaries to bring Pietro to him. Pietro was arrested trying to flee to Greece and was brought to Fumone, where he was confined until he died on 19 May 1296. Under pressure from the French king Philip the Fair, Pope Clement V canonized Pietro on 5 May 1313 in Avignon.

Celestine has been identified with Dante's *colui che fece per viltade il gran rifiuto*, "the one who made through cowardice the great refusal" (*Inferno* 3.59-60), but it is not certain that this was Dante's intention.

Cenne Da La Chitarra

Cenne (Bencivenne, d. by 1336) was a *giullare* (jongleur) from Arezzo known for his parody of *Corona dei mesi* (*Garland of the Months*), a cycle on the months of the year by his contemporary Folgòre da San Gimignano. Cenne was called *da la Chitarra* for his guitar, as was customary among other documented jongleurs who took the names of their instruments (Francesco degli Organi, Albertuccio della Viola). Nothing is known of his life except the year by which he was dead.

Cenne's cliirteen-sonnet parody is transmitted in two manuscripts: Vaticano Barberino Latino 3953 and Chigiano L.IV.131. There is no record of a fourteenth sonnet which would have corresponded to the concluding sonnet of Folgòre's cycle, *Sonetto mio, a Niccolò diNisi*. Otherwise, however, Cenne's parody follows the original sonnets image by image, using the same rhymes. The introductory sonnet, *A la brigata avara senza arnese*, notes the avariciousness of the people making up Cenne's *brigata* (brigade), in direct contrast to Folgòre's vision of an affluent courtly society marked by generosity of spirit and liberality in spending money. This concept is amplified in the concluding tercet of Cenne's *Di aprile vi do vita senza lagna*, in which people who brag about their generosity are despised by their neighbors for believing in an outdated courtly ideal. Furthermore, in the conclusion of *Di settembre vi do gioielli alquanti*, Cenne's brigade enters Siena yelling, "Death to those who want to defend courtliness" (*Mòia chi cortesia vuole defendere*). Whereas Folgore's courtly *brigata* enjoys life in every season, Cenne's *brigata* suffers from cold in the winter, heat in the summer, and mud in the spring and fall. Folgòre's sonnet cycle catalogs the great variety of rich food and drink consumed by his brigade; Cenne's sonnets speak of hunger, rancid wine, and cold roasts. Although Cenne's sonnets never rise above parody, they demonstrate how absurdly unreal and idealized the world described by Folgòre in *Corona dei mesi* may have seemed to contemporary readers.

Cento

The term *cento* is derived from the Latin noun for a patched or

patchwork quilt or cloak, and a cento (plural, centones) is a poetic work consisting of bits and pieces of poems by other authors. The form was prevalent in late antiquity. The composer of a cento extracts verses from a classical author and rearranges them to form a new work bearing little thematic relation to the original. A typical example is the popular *Virgilian Cento in Praise of Christ* (*Cento Virgilianus de laudibus Christi*) by the Roman poet Proba (fl. 354). In her cento, Proba combines lines from Virgil's *Aeneid* to narrate biblical stories; reordered and placed in a Christian context, Virgil's verses take on a significance not found in the *Aeneid* itself.

There are Greek and Latin centones predating the Christian era; in these, Homer and Virgil are frequent sources. Latin centones dating from the late second century after Christ use Virgilian verses to treat topics ranging from bread making to the judgment of Paris. In the fourth century, Ausonius produced his bawdy *Nuptial Cento* (*Cento nuptialis*) out of 131 lines from Virgil's *Aeneid*, *Georgics*, and *Eclogues*. In the preface to his work, Ausonius defines the cento, apologizes for "degrading" Virgil, and argues for his poem's unity, despite its disjointed origins.

Other centones from the fourth century reflect a Christian sensibility. In addition to Proba's work, we find the poems *On the Incarnation of the Word* (*De verbi incarnatione*), *On the Church* (*De ecclesia*), and *Verses to the Grace of Christ* (*Versus ad gratiam Domini*). By recontextualizing pagan verses, the Christian authors, or compilers, of these poems justified the study of pre-Christian material, endowing the classical work with a Christian significance.

The cento form can also be found in medieval music. Apparently, Pope Gregory compiled musical centones out of earlier sung portions of the mass; the concept of centonization applies to the formulaic composition of chants out of preexisting musical units.

Cerchi Family

The Cerchi migrated from Acone in the Val di Sieve to Florence in the late twelfth or early thirteenth century. In the 1240s, the family built *apalazzo* outside the city walls near Sant' Ambrogio, but since the Cerchi were leading Guelfs, it was destroyed by the Ghibellines when the family was exiled in 1248. The Cerchi later purchased and occupied the Florentine *palazzi* of the noble Conti Guidi. The Cerchi were leading wool merchants as early as 1212, when the eponymous Cerchio was rector of the *lana* (wool) guild. His son Oliviero founded the family bank, which had branches in Florence and abroad and financed the efforts of King Edward I of England beginning in the 1280s. Under the

direction of Vieri, who was knighted for military valor in 1267, the enterprises of the Cerchi developed into the city's most prosperous, until their bank failed in 1310.

The extended family split into two factions—the Whites and Blacks—during the 1270s or 1280s. When these labels came to be more widely applied in Florence, however, the Black Cerchi became leaders of the White Guelfs. Because of their wealth, and despite the fact that they were not of noble origin, the Cerchi were declared magnates in 1293. During the 1290s they carried out a long feud—described by the historian Dino Compagni (c. 1255-1324)—with the noble Donati clan (Blacks); for this feud, the Cerchi were condemned in 1298. In 1299, when Corso Donati and many Blacks were exiled, the Cerchi became leaders of the disenfranchised magnates of the merchant class. The power of the Whites, and also that of the Cerchi, was violently overthrown in 1301; and in January 1302 a broad proscription forced many of the Cerchi into exile, especially in Arezzo. Thereafter, out of concern for their businesses, the Cerchi kept a low political profile.

An outstanding member of this merchant family was Blessed Umiliana (1219-1246), a daughter of Oliviero (she was one of at least eighteen siblings). Umiliana was the first third-order Franciscan nun in Florence.

Certaldo

The town of Certaldo in Tuscany, in the Val d'Elsa between Poggibonsi and Empoli, is famous as the burial place (and possibly the birthplace) of Giovanni Boccaccio. From its low hilltop, Certaldo commands a broad agricultural area; in the Middle Ages the town served as the center for local exchange and protection.

Remains suggest that the hill may have supported a territorial center as early as the eighth century B.C. As trade and travel developed in the early Middle Ages, Certaldo became a center of minor importance along the Via Francigena, the main thoroughfare between France and Rome, as it passed through the Val d'Elsa. The earliest documentary evidence for Certaldo is in Frederick I Barbarossa's grants of the area to Count Alberto di Prato (1155 and 1164). In 1184, the victorious Florentines forced the Alberti to destroy and not rebuild their towers there. Florence and the counts would feud throughout the thirteenth century, though the town generally supported Florence. In 1198 Certaldo formally submitted to Florence, from which it received a governor.

In 1203 the nearby center of Semifonte was destroyed, and many refugees, including the duke, augmented Certaldo's population, which continued to grow during the thirteenth century. Also in the early 1200s, thanks to a split inheritance, Mainardo Alberti (the first to bear the name da Certaldo) attained the status of count and established the town as his seat. Despite its advantages, Certaldo never grew into a center for trade or industry; its economy remained strictly agricultural. Two factors hindering diversification were Certaldo's lack of direct contact with major roads (even the Francigena) or with the river (which was 2 kilometers, or well over a mile, away), and strong competition

from Empoli and Poggibonsi.

Certaldo's main road runs east-west, with houses, predominantly of brick, concentrated in an early settlement area known as the Borgo. The *rocca*, or castle, of the Alberti was originally constructed after 1150 and was torn down c. 1185. A new structure, today the Palazzo Pretorio, replaced it in the early 1200s. After Certaldo was subjugated by Florence, this building housed the local *vicari* (governors). In the course of the thirteenth century, walls were built around the town core, and by the early *Trecento* they circled most of the hill. Extramural settlements appeared by 1300.

Two churches of interest remain from the thirteenth century: Santi Tommaso e Prospero and Santi Michele e Iacopo, which was restored in the early 1900s. The anchorite Beata Giulia lived in Santa Maria for thirty years, sealed up in a room adjoining the sacristy. It is said that at her death in 1367, the bells of Certaldo tolled of their own accord

Before the black death, Certaldo housed about 1,200 people; but in 1357 Florence assessed the town as having only 167 hearths, a figure suggesting that Certaldo had probably lost 30 percent of its population during the plague. Because the economy of Certaldo and the opportunities it offered were so limited, many industrious Certaldesi, including the noted judge Iacopo da Certaldo and Boccaccio's father, emigrated to Florence. This emigration further reduced Certaldo's prospects for substantial growth.

Cesena

Cesena has Etruscan origins. As Caesena, it achieved municipal status and importance and became a significant mercantile center when the Roman road, the Via Aemilia, was constructed. It was occupied by Odoacer and was besieged by Theodoric in 493. After the rule of the Ostrogoths, it became part of the exarchate of Ravenna and withstood several attacks before it passed into the hands of the Lombards. Berengar besieged it in 961, and it was restored to the archbishopric of Ravenna in 998. In the eleventh century it came under the government of the free commune, with Forlì, Cervia, and Rimini as its principal rivals. In *Inferno* (27.54), Dante describes the political situation of Cesena as being between tyranny and freedom (*tra tirannia si vive e stato franco*). The papacy, unable to dominate Cesena directly, created it as a vicariate of Francesco Ordelaffi, who had possessed it since 1333. In 1357, the city was taken by Cardinal Albornoz, but he faced resistance by Cia degli Ubaldini, the wife of Ordelaffi. For the rest of the fourteenth century, Cesena was contested by papal authorities and local factions. The upheavals included a brutal sack of the city in 1377 by forces under Robert of Geneva in the service of Gregory XI. In 1379, Galeotto Malatesta was made papal vicar by Urban VI, initiating a period of recovery.

Charitable Institutions

Almsgiving and other forms of charity have played a central role in Muslim and Christian societies, especially in the Mediterranean world. Even in classical antiquity, Mediterranean societies emphasized the duties of hospitality as well as the prestige that wealthy patrons and benefactors of cities could enjoy. Roman emperors and private benefactors established foundations to aid poor families who had children, for example. In the classical world, however, hospitality remained largely a virtue of private households; in the public sphere, civic benefactors might indirectly benefit the poor, but there is little evidence of major programs to unite hospitality and patronage, despite direct welfare from the state as well as pagan temples that assisted the needy. The problems of abandoned children, for example, were more often solved by substitution, purchase, slavery, and prostitution than by imperial or charitable foundations, which in most cases required parents to enroll their children.

Indeed, one of the early markers of Christian identity was the explicit injunction among members of early Christian communities to provide alms for the poor, a function taken up in the third and fourth centuries by large urban basilicas. Even anti-Christian commentators noted that the acceptance of Christianity in the Roman empire was due in no small way to the replacement of the temple by the basilica as the source of almsgiving. These charitable functions multiplied during the urban economic crises of the fourth and fifth centuries. At least one historian credits the Byzantine empire with the "birth of the hospital," and many of the earliest exhortations for Christians to aid the poor in their midst came from Greek patristic authors such as John Chrysostom, who counseled Christians whose prayers had not been answered to consider how many times they had refused to hear a poor man's pleas. In the eastern empire, general hospitals for the poor and infirm as well as orphanages date from at least as early as the fifth

century after Christ, and at least one orphanage in Constantinople was renowned for its musical performances in the late fifth century.

In addition to charity provided by basilicas in the Latin west, the Benedictine rule provided a model for monastic charity from the sixth century on in Italy as well as in the rest of Europe, when it prescribed that monks greet weary pilgrims and other travelers, wash their feet, and take them in. Even so, medieval monasteries in Italy, as elsewhere in Europe, made clear that their primary duties involved prayer for the salvation of souls rather than nourishment of the bodies of strangers. Monastic charity was itself liturgical and ritualistic, often restricted to certain feast days with deliberate limits on the types and numbers of poor assisted. Even in Italy, parts of which remained somewhat urbanized throughout the early Middle Ages, poverty as a lack of wealth was a concept hardly intelligible to monks or other administrators: as a juridical category the poor were those without military power and arms. Becoming part of the "poor in spirit" by deliberately renouncing worldly wealth and military power was itself considered sufficient for salvation. Moreover, charitable institutions and gift economies do not easily coexist, since gift economies require material and symbolic reciprocity and the poor require liquidity. Even monasteries rich in lands were cash-poor and relied on their own products, especially grain, olive oil, and wine, as forms of direct assistance, and on their ability to provide temporary shelter.

Although one can argue that the practice of oblation, or the consignment of children (especially boys) at a very young age to the protection of a monastery, constituted an alternative to child abandonment, this hardly places monasteries in the category of charitable institutions. Not until the mid-tenth century did the office of almoner become important in monasteries, and even then monasteries organized poor relief around liturgical occasions celebrating the symbolic importance of the poor, rather than responding to individualized and discrete forms of poverty. For aristocratic givers as well, generosity tended to be an ostentatious affirmation of status, often unrelated to the plight of the truly poor.

The growth of charitable institutions in Italy is linked, then, to the urban revival of the eleventh and twelfth centuries, which saw the creation of hospices for pilgrims. The tension created by the clash

between the reality of commercial activity and the severe counsels of Christian perfection generated and nourished new forms of spirituality. If during the early Middle Ages the aristocrat saw charity as penance, the urban merchant contended with the specter of avarice as an occupational hazard. Twelfth-century preachers emphasized how much easier was the monk's path to salvation, and how much more difficult and full of temptation was the same path for urban merchants. This distance between monastic perfection and urban guilt could be covered only by generous and effective almsgiving. The life and teachings of Saint Francis, his devotion and the devotion of his followers to "Lady Poverty," and his immense popularity in Italy during the Middle Ages all testify to deeper psychological tension in the urban economy. Few conflicts were as theologically troubling as the questions raised by the *fraticelli* who understood the abyss between the wealth of the medieval church and the example of apostolic poverty. Few scenes in early fourteenth-century Italian painting were more compelling than the drama of Francis renouncing his fine clothes and his mercantile career as his father sought to reclaim him.

Not until the subsistence crises of the early fourteenth century did most Italian municipal governments understand the urgency of actual poverty. The commune of Florence, for example, set aside only 2,000 lire per year as its entire subsidy to ecclesiastical institutions for the needs of the poor. Confraternities and other urban groups who aided the poor depended much more on voluntary contributions, bequests, and wealthy benefactors. Municipal governments did, nonetheless, enter into the business of poor relief in the sense that they attempted to keep grain supplies constant and to regulate prices. Legislation to protect the interests of minors constituted another form of intervention, and in Venice the procurators of San Marco may have reached a wider swath of the Venetian population than the Venetian confraternities known as the *scuole grandi*. Especially after the black death of 1348, many municipal governments acted to regulate private and corporate charity as well. Quite late in the medieval period, beginning in the early 1460s, municipal governments began to establish *monti di pieta*, whose purpose was to provide lending and pawnbroking services to poor clients at an affordable rate of interest. If, in retrospect, municipal governments seem to have been slow to recognize the realities of urban

poverty, Italian cities were nevertheless envied by observers from beyond the Alps.

This was also true with respect to the growth of hospices and hospitals. The earliest known Italian hospitals seem to have been founded toward the end of the twelfth century. In many cases, the documentary evidence is uncertain, and even more frequently it is obscured by institutions seeking to claim greater antiquity than their rivals through legend or forgery. Early foundations include the hospital of Santa Maria della Scala in Siena (which claims to date from the 1190s), the hospital of Santo Spirito in Sassia in Rome (which may date back to the pontificate of Innocent III in 1198-1215), and the hospital of Santa Maria Nuova in Florence (founded in 1286 by Folco Portinari, the father of Dante's Beatrice). By the mid-thirteenth century, documentation concerning the foundation of hospitals becomes generally more reliable; and hospitals and other charitable institutions began to proliferate in Italian cities and towns in the period from 1250 to 1400—dates that coincide exactly with the onset of serious urban economic and social crises which left the poor especially vulnerable. The greatest number of foundations can be seen in the periods of greatest social extremity: 1340 to 1440. Hospitals that already existed, even in much smaller urban centers, also benefited from this era of crisis. In 1427, the Ospedale del Ceppo in Pistoia (founded in 1277) had a larger budget than the bishop's.

The growth in the number of foundations of hospitals corresponded not only to issues of need but also to a decline in confraternities as charitable institutions, a shift that is clear at the end of the fourteenth century in Florence and about half a century later in such northern Italian cities as Bologna, Milan, and Venice. This was due in part to the important links that confraternities initially had with hospitals—in the case of Florence, the confraternity of the Bigallo supervised as many as ten hospitals before it was reorganized by the commune in the late fourteenth century. In all four cities, the growing concern of municipal governments to supervise the activities of confraternities also encouraged the sponsorship of large general hospitals and more specialized institutions as symbols of civic prestige. During the fifteenth century, following the example of Brunelleschi's design for the Ospedale degli Innocenti in 1419, both Bologna and Milan used

architectural grandeur to make their respective hospitals more worthy symbols of civic grandeur.

Despite overall trends suggesting a shift in emphasis from direct giving through confraternities to more indirect giving to hospitals and other charitable building programs in the fifteenth century, the development of charitable institutions was hardly uniform, even in northern Italy. Smaller urban centers such as Brescia and Bergamo moved, early in the fifteenth century, to consolidate their scattered hospitals under a single administrative unit; but larger urban centers such as Florence and Venice were slower to do this. Even in those cities that established general hospitals, specific social and medical pressures continued to encourage specialization in the care of abandoned children and, after the 1490s, in the care of patients afflicted with syphilis. Some Italian urban centers, such as Turin, were more successful at allowing competing claims of patronage from noble families to define charitable practice, a tendency noticeable to a lesser extent in Bologna. Whatever the mixture of motives for charitable giving to institutions, Italian institutions and the elites they served provided a model of relief for the poor that was widely admired and imitated by Europeans of various religious persuasions well after the close of our period.

Charlemagne

Charlemagne (742 or 747-814) was the most illustrious Carolingian ruler of the Frankish kingdom. He and his brother, Carloman, succeeded their father Pepin III as co-kings in 768. Upon Carloman's death in 771 Charlemagne assumed sole rule, and he soon launched a multifaceted program that enhanced the authority of the recently established dynasty and the position of the Frankish kingdom.

Military campaigns occupied much of Charlemagne's attention during the first three decades of his reign, resulting in tighter control over Aquitaine and Bavaria and the incorporation of previously independent peoples and extensive territories into the Frankish realm. Especially notable were the king's victories over the Saxons, the Frisians, and the Avars and his establishment of a Frankish enclave south of the Pyrenees at the expense of the Muslims. Conquest was followed by the conversion of these new subjects, often by forceful means. Active contacts with new peoples beyond the expanded frontiers—Slavs, Danes, the Christian kings of Asturia, the Muslim

princes in Spain, and the Anglo-Saxon kings of England—extended even further the Franks' sphere of influence as the dominant force in the west.

Charlemagne's expansionist policy inevitably drew him into Italy. In 773-774 he invaded the Lombard kingdom, prompted by the Lombards' threats to the papal state and by the pleas of Pope Hadrian II (772-795) for the protection Pepin III had promised. Victory in this campaign resulted in Charlemagne's assumption of the title king of the Lombards. While the war against the Lombards was in progress, Charlemagne visited Rome, where he renewed Pepin's promise of 754 to restore extensive territories to the papal state. During the rest of his reign Charlemagne devoted considerable attention to solidifying control over his Italian kingdom and defining its boundaries. In 781 he installed his son Pepin as king of Italy, thus establishing a subkingdom with limited autonomy but ultimately subject to Charlemagne. Charlemagne also asserted his authority through an ever increasing influx of Frankish nobles who filled key offices. Charlemagne and Pepin waged a long but eventually unsuccessful campaign to assert authority over the Lombard duchy of Benevento in southern Italy. The papacy constantly implored Charlemagne to honor his promise of 774, but with only minimal results. Although he generally respected papal sovereignty over the papal state and honored the successor of Saint Peter as the spiritual head of Christendom, the Frankish king increasingly intervened in internal affairs of the papal state. The Franks' involvement in Italy led to an increasingly hostile relationship with the Byzantine empire.

Charlemagne was concerned with more than military conquest. He acted in a variety of ways to expand and regularize royal administration in order to promote justice and concord among his subjects. He utilized royal authority and guidance from the papacy to intensify religious reform aimed at strengthening ecclesiastical organization, improving the quality of the clergy, standardizing religious practice, and guarding orthodoxy. To provide the human resources capable of guiding the renewal of political and religious life, he initiated educational reforms which led to a wide-ranging cultural "renaissance" focused on the recovery and intensive study of patristic and classical sources to help shape a Christian society.

Charlemagne. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. I68r.

Charlemagne's success in renewing Christian society led to his elevation to the emperorship. The situation in Rome provided the immediate setting for this event. In 799, Pope Leo III (795-816), accused of misconduct and physically attacked by his Roman enemies, was forced to call on Charlemagne to save his position. In late 800, the king journeyed to Italy and presided over a legal process that cleared Leo. Then, when the king was attending Christmas mass, Leo placed a crown on his head while the "Roman people" acclaimed him "emperor of the Romans." Behind this dramatic event were complex forces involving, among other things, a growing perception in Frankish circles that their king deserved recognition as the God-ordained guarantor of the safety of Christendom, a deepening sense of the unsuitability of the Byzantine emperors for the highest office in the Christian world, and the confusion surrounding Charlemagne's legal position with respect to

the papal state.

What the new office meant to Charlemagne remains enigmatic. Some of his actions after 800, especially his successful campaign to force Byzantium to recognize his title, suggest that he considered the title important. Others, particularly the provisions he made in 806 to divide his realm among his three sons without reference to the imperial title, imply that he viewed the title as little more than a personal honor. The premature death of two of his sons negated the need for division, and in 813 Charlemagne personally crowned his surviving son Louis as emperor and heir to the united empire. Early in 814, the "great" king died after a career that had in many ways changed the course of European history.

Charles I of Anjou

Charles I (Charles of Anjou, 1226 or 1227-1285) was the youngest son of Louis VIII of France. Charles married Beatrix, heiress of Provence, in January 1246 and became, in her right, count of Provence. He was created count of Anjou and Maine by Louis IX in May 1246. When Beatrix died in 1267, Charles, supported by Louis, secured the homage of Provence for himself, rather than for his eldest son, and retained it until his death. He thus incurred the hostility of Beatrix's elder sister Margaret, wife of Louis IX; and that of the overlord of Provence, James I of Aragon. Charles's next marriage, to Margaret, countess of Tonerre and Auxerre, was childless, and on her death he lost the lands that she had brought him.

Charles was first offered the throne of the kingdom of Sicily (the Regno) in 1253 by Pope Innocent IV, who regarded the kingdom as a papal fief and had confiscated it from the Hohenstaufen. However, Innocent's conditions were too hard, and Charles declined. After successive popes had failed to find an alternative, Urban IV resumed negotiations with Charles in 1263. Charles agreed to lead an expedition to the Regno, which Urban would designate a crusade. Shortly afterward, Charles was elected senator of Rome, somewhat to the dismay of Urban, who thought that Charles was accumulating too much power; but Urban died in 1264 and was succeeded by the more compliant Clement IV. Charles then headed southward and, after outmaneuvering the Hohenstauffen vicar in northern Italy through a system of alliances with the marquises of Este and Montferrat, came to Rome, where he established himself in June 1265 and was crowned king of Sicily.

The Regno by this time was governed by Manfred, bastard son of

Frederick II of Hohenstaufen. Manfred's daughter Constance was married to Peter, the crown prince of Aragon, who had been hostile to Charles since Charles's takeover of Provence. In early 1266, in a rapid campaign culminating in the battle of Benevento, Charles defeated and killed Manfred and seized the Regno. Two years later Charles defeated the last Hohenstaufen claimant, Conradin, at Tagliacozzo to become the unchallenged king.

Charles's administrative system was essentially that of Frederick II, but with some substantial modifications. Local government was in the hands of ten justiciars, one for each of the provinces into which the Regno was divided. These justiciars dealt with judicial, administrative, and financial matters. The great offices of state continued to function, but the treasury was developed and made more independent. This reflects Charles's concern with finances. He ran heavily into debt during the initial campaign of conquest, despite subsidies from his brothers and the pope, and he wanted money for further conquests. His taxation—the general subvention first introduced by Frederick II—based on an estimate of the number of hearths in each area, was much heavier and more frequent than previously, and his rapacity was the more unpopular because his government was repressive: he ceased to call parliaments as Frederick II had done, and he drastically reduced the independence of the communes. He continued to demand military service (or its cash equivalent) from the nobles, but he used them less in government, which he entrusted mostly to harshly efficient agents imported from France and Provence. Their records were well preserved in another innovation of Charles's reign, the great series of Angevin registers. These registers were a system of record-keeping in advance of that of any other European realm and, until their destruction in 1944, constituted a major source for the history of the Regno.

In addition to the Regno, Charles claimed, as Manfred's conqueror, certain territories which Manfred had acquired through his wife in Epirus, including Corfu. Charles received the submission of both Lombardy and (after a show of force) Tuscany. In 1266 he temporarily relinquished the office of Roman senator; but in 1268 Rome again elected him senator for ten years (in fact, he retained the office for life). In 1267, he made an agreement with the evicted Latin emperor of Constantinople whereby the emperor's son Philip would marry

Charles's daughter Beatrice and Charles would help them to recover Constantinople from the Byzantine emperor Michael VIII Palaeologus. In return, Charles would get the suzerainty of Achaea (roughly, southern Greece), most of the Aegean islands, and the reversion of the empire if Philip should die childless. Finally, in 1277 he bought the rights of Maria of Antioch in the kingdom of Jerusalem and, denouncing its holder as a usurper, claimed it for himself. In theory Charles was building up an excellent Mediterranean empire.

However, the realization of that empire was delayed: first by a disastrous crusade led by Louis IX in 1270, which Charles felt bound to join (though he deflected it to Tunis, where a victory would have served Sicilian interests well); next by various defections in northern Italy; and then by a treaty of union between the Greek and Latin churches, negotiated by Michael VIII at Lyon in 1274, which led Pope Gregory X to forbid Charles to pursue his claims in the Byzantine empire. Charles did establish his government in Achaea, but nothing more. By 1281, however, there was a French pope, Martin IV, in Rome and the treaty of union was clearly unenforceable; therefore, an expedition to Constantinople seemed practicable. It was forestalled, though, by a rising against Charles, known as the Sicilian Vespers. This rising was provoked by resentment of the oppressive foreign administration and was backed by the Aragonese king, Peter III, who now put forward his claim to the Regno in the right of his wife, Manfred's daughter Constance. Charles had to abandon his dream of a Mediterranean empire, and he spent the last three years of his life fighting to retain his throne.

Charles II of Anjou

Charles II of Anjou, "the Lame" (1254-1309), was the second son and heir of Charles I of Anjou and was prince of Salerno and vicar of the Regno (the kingdom of Sicily) for Charles I from 1283 until the latter's death in 1285. On the death of Charles I, Charles II inherited, in addition to the Regno, the counties of Provence, Anjou, and Maine. Charles II had directed the Angevin defense of Sicily in the war that broke out after the Sicilian Vespers, had been taken prisoner in June 1284, and when his father died was still being held by the Aragonese in Messina. He was released in 1288 by the treaty of Canfranc, negotiated by Edward I of England. This treaty obliged Charles to negotiate peace between Alfonso III of Aragon, the pope, his own kingdom of Naples, and Philip IV of France—whose father, Philip III, had been brought by Pope Martin IV into the war of the Sicilian Vespers on the side of the papacy and the Angevins. If he failed to do so within three years, he was to return to captivity; meanwhile, three of his sons were delivered to the Aragonese as hostages. Once liberated, Charles was crowned king of Naples and Sicily by Pope Nicholas IV at Rieti. He did fail to negotiate a peace within the stipulated time and duly surrendered himself at the Aragonese frontier; but Alfonso wisely ignored this gesture, since Charles's efforts to make peace were in fact progressing.

Part of the problem was that Martin IV had transferred the Aragonese throne to Charles of Valois, brother of Philip IV of France, declaring that Alfonso had forfeited it by his attack on Sicily. Charles II succeeded in buying Valois off by ceding to him the appanages of Anjou and Maine in exchange for two concessions: part of the territory of Avignon that had come to Valois through Philip III (Charles already held the rest as count of Provence) and Valois's renunciation of all claims to Aragon. This stratagem failed when Alfonso of Aragon died (in 1291) before ratifying the peace. Alfonso's brother and heir, James II, repudiated the peace negotiations, and not until 1295 was peace finally concluded at Anagni, under the auspices of Pope Boniface VIII, between James II of Aragon, Philip IV of France, Charles II, and the Holy See. Even the peace of Anagni did not end the war, which was continued between Charles II and James's younger brother Frederick,

regent and self-styled king of Sicily, until the peace of Caltabellotta in 1302, whereby Frederick kept Sicily and Charles held Naples and the mainland.

Charles's contemporaries considered that he lacked valor; but his search for peace may have reflected a religious sincerity which, as they acknowledged, was unusually strong. His achievements were not negligible. He preserved the southern Italian mainland for his dynasty. Partly through his agency, his grandson Charles-Robert (Carobert) was accepted as king of Hungary. Charles recovered extensive lordships in Piedmont and, as the preeminent member of the Guelf party, he dominated—arguably, even controlled—much of Italy. His government records show sincere efforts to stop corruption. He completed his father's administrative organization of the Regno and, less austere than Charles I, won support for his dynasty on the mainland— support without which he could not have resisted the Aragonese attack.

Charles of Valois

Charles of Valois (1270-1325) was the third son of Philip III of France. In 1284 his father accepted for him an offer by Pope Martin IV of the throne of Aragon as a fief of the papacy, King Peter III having been deposed in retaliation for his attack on Sicily. The disastrous "crusade of Aragon" followed, in which Philip III died of fever. Shortly afterward, Peter III also died, leaving Aragon to his eldest son, Alfonso, and Sicily to a second son, James. Alfonso held Charles II of Anjou prisoner but released him on parole to negotiate a treaty with France and the papacy. The first step toward this treaty was an agreement with Valois. Valois would marry Charles II's daughter, Marguerite, who would receive as dowry the counties of Anjou and Maine; in return, Valois was to renounce his claim to Aragon. In fact, although Valois got the two counties immediately, he did not renounce his claim to Aragon until 1295, under the terms of the peace of Anagni; James II of Aragon (succeeded 1291) and Philip IV of France also agreed to that peace.

Thereafter, Valois became involved in the war between France and England which broke out in 1294. In 1298, however, Boniface VIII invited him to take the field in Sicily against the regent Frederick, who was keeping Sicily in defiance of the peace of Anagni; Boniface also offered to subsidize Valois's campaign. In 1299, on the death of Marguerite d'Anjou, Boniface offered Valois a further incentive—the promise of the hand of Catherine Courtenay, titular heiress of Constantinople; on condition that Valois expel Frederick before going on to win himself an eastern kingdom. Having arrived at Rome, Valois was diverted by Boniface to "pacify" Florence, which was then in the hands of the party of the Cerchi, or White Guelfs. Boniface VIII preferred the more anti-imperial Black Guelfs led by Corso Donati, largely because the Cerchi sympathized with his archenemies, the Colonna. Charles obtained entry into Florence (as nominal Guelfs, the Cerchi were reluctant to oppose a French prince) and—despite having taken an oath not to do so—facilitated the return of Donati, who instituted a reign of terror. (Donati's terror is best-known for the sufferings it caused Dante, who was persecuted as a White, and for the exile of Perarch's father.) Charles's rapacity in Tuscany became unrestrained; but in 1302 he left for Sicily, where, with an Angevin army led by the future Robert II, he embarked on an unsuccessful though devastating campaign. News of the disastrous defeat of Philip IV at Courtrai and worsening relations between France and Boniface VIII, however, drove him to abandon the war: in August 1302 he secretly negotiated the peace of Caltabellotta.

Back in France, Charles was involved in unsuccessful maneuvers to become Holy Roman emperor in 1307. He also tried to organize an expedition to recover his wife's empire of Constantinople, and, in 1323, he became active in promoting a new crusade to the Holy Land. But for the rest of his life he was too closely involved in French politics to leave France.

Charles the Bald, Emperor

Charles II the Bald (823-877), Carolingian king of the West Franks, owed his elevation to Holy Roman emperor to the initiative of Pope John VIII (872-882), who was eager to find a protector to replace Emperor Louis II (d. 875). The title served Charles's ambition to increase his status among rival Carolingian rulers. After his coronation in Rome in 875, the new emperor won tentative recognition in Italy and in his own kingdom, but not from his brother Louis, king of the East Franks. As emperor Charles led an army into Italy in 877 in response to appeals from the papacy for protection against Muslim attacks; but a revolt in his own realm led by opponents of his imperial venture forced him to retreat from Italy. During this retreat, he died. Charles's brief emperorship made clear that the imperial office had become an instrument of the papacy to serve Italian purposes but was of little importance to the rest of the Carolingian world.

Chiaro Davanzati

The dates of the poet Chiaro Davanzati are uncertain. There was a Chiaro among the Guelfs at the battle of Montaperti (1260), probably identifiable as Clarus, son of Davanzati Banbakai of San Frediano, later capitano of Florence's Or San Michele in 1294. The birthdate of this Chiaro or Clarus can be conjectured as c. 1235, and he was dead by the spring of 1304. Another Chiaro, or Chiarus, from Florence's Santa Maria sopr' Arno, died before 1280, and so cannot be the Chiaro in *tenzone* with Dante da Mainao in 1283.

In any case, however, Chiaro was one of the principal poets of early Italian literature. He produced an extensive poetic correspondence in *tenzone* and prolific lyrics—second only to those of Guittone among the Tuscans before Dante in MS Vatican Latino 3793. The exact number of Chiaro's compositions is difficult to ascertain, though. There are at least sixty-one *canzoni* and perhaps 122 sonnets of relatively certain attribution. Moreover, his popularity in his own generation, his recognizable themes, and his easy style (*trobar leu*) led subsequent copyists of the *Duecento* and *Trecento* to ascribe to him similar but otherwise anonymous poems.

Foremost in Chiaro's work is his treatment of popular bestiary motifs, which are often transferred with perhaps too keen an eye to their usually Occitan sources—especially Rigaut de Barbezieux and intermediaries among the Sicilian poets (Giacomo da Lentini, Guido Delle Colonne, and Stefano Protonotaro). Chiaro's bestiary figures, even when they are used as extended similes to advance his narrative, often seem sterile, unspontaneous, and encyclopedic (recalling *Mare amoroso*). In his *canzone* *Quando lo mar*, Chiaro, immersed in a metaphor of the tempestuous sea, turns from the conventional wisdom

that every being draws joy from fulfilling its true nature (as in *L'autrier*, by the twelfth-century Gascon troubador Marcabru) to discuss his own experience. Yet Chiaro does not make much of this development; he calls on an already overworked motif of "fish in the sea" (*e come pesce per lo mare stava*). In the next stanza, the protagonist, removed from his natural environment, is more a dry metaphorical fish than a poet, and this image is reinforced by the simile [*come d*]onde lipesci, *ch'indi ban vita*.

Chiaro has been categorized as a *guittoniano*, but his links to Guittone's influence are much more limited than this description would suggest. His direct contact with Guittone appears incontestable in only one *canzone*, *Valer voria s'io mai fut validore*, and is no more than conjectural in *Sovente il mio cor*. Most of his Guittonean characteristics—his difficult formal devices and syntax—appear in lyrics he exchanged either with true *guittoniani*, such as Pallamidesse and Rinuccino, or with poets of an equally rhetorical bent in terms of their formalism but not their content, such as Monte Andrea (one of his chief correspondents) and Finfo del Buono. Guittone's *Ahi lasso, or è stagion* certainly served as the thematic and moral model for Chiaro's reprimand of the Florentines, *Ahi dolze e gaia terra fiorentina* (1267). And Guittone's difficult *De coralmente amar* was undoubtedly the template for Chiaro's sonnet *Chi 'ntende, intenda*. But even *Chi 'ntende*, which was probably part of a *tenzone* with Pallamidesse, assumes the stylistic manner of the addressee, who was a Guittonean. (Similar "Guittonean circumstances" are realized in the young Dante's correspondence with Dante da Maiano, who was then a more established personage.) That Chiaro was something of a stylistic chameleon is corroborated in his poem *Con adimanda*, in a long political *tenzone* of 1278. Responding to Monte's *S'e'ci avesse*, which is dazzlingly structured on ten rhyme forms of *campo* and six of *corso*, Chiaro, in a "Montean" way, constructs eight rhymes of the word *porta* and six on the monosyllabic *pò*, producing rare *endecasillabi tronchi* (truncated hendecasyllables). In the same poem, Chiaro's conventional bestiary is transformed into the emblematic synecdoche of *Vermiglio il campo, Vagulia i sù portal ad oro*. . . .

Nevertheless, Chiaro's preferred poetic manner can be characterized as an easy style, or *trobar leu*, reminiscent of Bonagiunta's syntax and

language but without Bonagiunta's lyricism. In the fourteenth century, Chiaro's popularity suffered a rapid decline, perhaps because his strategy of reelaborating lyrics seemed exhausted. Still, with his light style, Chiaro produced a few crystalline images, also borrowed from Occitan verse, of a child at a mirror (*Come 'l fantin ca ne lo specchio smira*), which—as is attested to by MS Parmense 1081 (late fourteenth or early fifteenth century)—survived into the Renaissance.

Chronicles

The most significant Italian chronicle of the early medieval period can confidently be said to be *Historia Longobardorum* by the eighth-century Lombard monk Paul the Deacon, an account of his people's invasion of Italy and the establishment of their kingdom. Paul, who had been educated by the grammarian Flavianus, composed his work in a clear Latin narrative style. He noted not only political events but also droughts, floods, plagues, comets, and eclipses.

Paul had no immediate successors whose writing could equal his own in quality, although after his death the history of the Lombard states in Italy was recorded in various other chronicles. These included the chronicle of Erchemperto, covering the period 774-888; and *Chronicon Salernitanum*, which provided an account of developments, particularly in the Lombard duchy of Benevento, from 574 to 974.

During the late eleventh century, a school of historical writing began to flourish in southern Italy—where Erchemperto's work and *Chronicon Salernitanum* had both been produced. This school initially emerged as a result of the Norman conquest of Sicily, but subsequently it was also influenced by the growth of a rich monastic and curial culture. Three important chronicles—those of Amato di Montecassino, Goffredo Malaterra, and William of Apulia (Guglielmus Apuliensis)—described the exploits of Robert Guiscard and his followers, the founders of the Norman kingdom of Sicily. Amato's work, which goes to 1078, survives only in a later Old French translation. But the chronicle of Malaterra, a monk who moved from his native Normandy to serve in the court of King Roger of Sicily, and the verse history of William of Apulia can be read in their original Latin versions, Malaterra's chronicle ends in 1099 and therefore covers Roger's reign as well as the military campaigns of Guiscard; William's chronicle ends in 1085. Both were written in the closing years of the eleventh century.

Contemporary with these accounts of the knightly prowess and political achievements of the first Norman rulers of Sicily were the earliest parts of the most significant southern Italian monastic chronicles. The chronicle dealing with the famous Benedictine abbey of Monte Cassino (*Chronica monasterii casi nensis*) was begun by Leone Marsicano in the late eleventh century and continued by Peter the Deacon in the early twelfth. Gregorio of Catino, a monk of the abbey of Farfa, started compiling his chronicle (which dealt with the history of his monastery from the ninth century on) probably between 1099 and 1119. Giovanni Monaco began his *Chronicon Volturnense* (a chronicle of the abbey of Volturmo) during roughly the same period. Both Gregorio di Catino and Giovanni Monaco included in their works collections of documentary materials relating to their monasteries and sometimes also to the broader political or ecclesiastic history of their time; as a result, even though they were primarily concerned with their

own abbeys, they recorded much information of more general interest.

Romualdo Guarna, known as Romualdo Salernitano—a physician, priest, and, from 1154 on, archbishop of Salerno—extended the range of the historical writing produced in southern Italy with his universal chronicle, which covered the period from the creation to 1178. He drew on the Bible, the church fathers, and Isidore of Seville, initiating a tradition of placing contemporary events in the context of a history of the world. Romualdo was actively involved in politics, and so, for the latter part of his work, he was also able to draw on his own recollections. His close links with the Norman monarchy led him to adopt a viewpoint different from that of Ugo Falcando, the other great historian of southern Italy in the late twelfth century, of whom Gibbon wrote, "His narrative is rapid and perspicacious, his style bold and elegant, his observation keen." Falcando was a cleric, but one with a solid knowledge of classical culture. In his work on the kingdom of Sicily, he tended to identify with the cause of its barons, probably because of his French origins and his association with the Siculo-Norman feudal aristocracy. He produced an account of developments between 1154 and 1169 that went beyond a bare recital of facts to a description of the institutions and political forces of his time.

The next two or three generations of southern Italian chroniclers recorded the dramatic events of the reigns of Henry VI and Frederick II and the subsequent conflict between the latter's heirs and Charles of Anjou. Peter of Eboli, in his poem *De rebus siculis* (*Sicilian Matters*), written for and in praise of Henry VI, dealt with the period 1130–1194 and celebrated the transfer of power from the Norman to the Hohenstaufen dynasty. Riccardo da San Germano provided a rather more objective narrative of events from 1189 to 1243. Nicola Jamsilla, an author more committed to the cause of Frederick II and Frederick's son Manfred (whom Nicola served as an official), gave an elegant account of developments between 1210 and 1258. Riccardo and Nicola were both notaries with experience in imperial administration. They were followed by Saba Malaspina, who was a cleric devoted to the propapacy party; and Bartolomeo da Neocastro, who was a jurist in the service of Peter of Aragon when Peter became king of Sicily and was an apologist for the revolt against Charles of Anjou known as the Sicilian Vespers. Saba Malaspina and Bartolomeo de Neocastro both dealt,

though from different points of view, with the period from the death of Frederick II in 1250 to the time in which they were writing—the last quarter of the thirteenth century.

From the Norman conquest to the establishment of the Angevin dynasty in Naples and the Aragonese dynasty in Palermo, southern Italy had been a fruitful source of historical writing because of the patronage provided by strong governments and the rich tradition of its old monastic institutions. During the same time span, however, chronicles had also been composed in the different environment of the city-states of the northern half of the peninsula, laying the foundations of a historiography which was eventually to become more distinguished than that of the south. In the late eleventh century, in Milan, a priest known as Landulph Senior had already written a history of his city in four books. Landulph Senior, an opponent of the Gregorian reforms, gave a lively and interesting description of the conflicts these reforms provoked in his local church and community. Another, later cleric, Landulph Junior (who was unrelated to Landulph Senior), was a supporter of the Hildebrandine cause and had studied in France; he gave a history of the same commune in the immediately ensuing period, between 1095 and 1137. At the same time, in the maritime republic of Genoa, Caffaro, one of its most distinguished citizens, initiated a chronicle that would be continued by others after his death. Caffaro himself dealt with the years 1099-1163, devoting his attention not merely to the domestic history of Genoa but also to its naval expeditions and to the crusades for which it provided ships. Bernardo Marangone, a Pisan jurist a generation younger than Caffaro, also recorded the exploits of his fellow citizens in his annals. The first part of Marangone's work, going back to the creation, was a compilation from other sources; but the second part, an account of the years 1136-1182, drew directly on his own recollections.

These civic chronicles of the late eleventh and twelfth centuries established a tradition that was to flourish in the thirteenth and fourteenth. Those who contributed to it were mainly notaries and merchants; but in the earlier part of this period they also included two friars; the Franciscan Salimbene de Adam of Parma and the Dominican Jacopo da Voragine of Genoa. Of the two, Salimbene was undoubtedly the more interesting and widerranging historian. He traveled

extensively and met many of the most important figures of his time. His chronicle is therefore concerned less with his own city than with developments in Italy as a whole and in other parts of Europe, and with the actions and intrigues of the members of his order. Like the English monk Matthew Paris, his contemporary, Salimbene was fascinated by the curious and the picturesque, loved gossip, and tended to interweave details of his personal experience with his account of events. He abandoned the convention that a chronicle should be a record of bare facts and made it instead a vehicle for conveying his impressions of what he had seen and heard. In contrast, Jacopo da Voragine confined himself to describing what had occurred in his own city and dealt with this more fully than the previous Genoese annals had.

The civic chronicle proper found its finest exponent in the thirteenth century in the Paduan notary Rolandino. After studying grammar and rhetoric in Bologna under the famous Buon compagno and then teaching those subjects in Padua, Rolandino produced his *Chronica in factis et circa facta Marchie Trivixane*, an accomplished account of the rise and fall of the tyrant Ezzelino da Romano, and of events in Padua between 1200 and 1262. Rolandino's style and his outlook as a defender of civic liberty were to serve as models for Albertino Mussato (1262-1329), who wrote two large-scale works on the history of his own time. One of these two works was on the descent into Italy of the emperor Henry VII; the other was on developments in Italy following Henry's death, and particularly on the unsuccessful struggle of Padua to preserve its independence and avoid conquest by Cangrande della Scala of Verona. Another chronicler, of lesser stature, was Ferreto dei Ferreti of Vicenza. Ferreto was also preoccupied with the loss of his city's freedom; however, the scope of his *Historia* extended beyond Vicenza, embracing developments in northern Italy generally from 1250 to 1318. The same is true of the mid-fourteenth-century chronicle by the Paduan jurist Guglielmo Cortusi, dealing with events "in Padua and Lombardy." Cortusi's concern with the history of the region beyond his city reflected a broadening of the field of political action in his time. His work is also to a large extent a study of the instability of governments in an age of territorial consolidation and frequent changes of rule—as is the anonymous *Chron icon Parmense*, which dealt with developments in and around Parma to 1337.

The rise of strong despotic states in northern Italy between the 1330s and the 1350s generated its own historiography. This had been foreshadowed, at the end of the previous century, by the Dominican Stefanardo da Vicomercato. Stefanardo had celebrated, in a verse history, the achievements of Ottone Visconti, the archbishop of Milan who was the first of his lineage to dominate that city. Galvano Fiamma (1283-1344), another friar from Stefanardo's convent, Sant' Eustorgio, was also a strong partisan of the Visconti. Galvano wrote several chronicles dealing with the history of Milan and exalting the Visconti, who by his day had in effect become its ruling dynasty. Pietro Azario of Novara, in his account of events in Lombardy between 1250 and 1362, also concentrated on the achievements of the Visconti, as did Bonincontro Morigia of Monza, although to a lesser degree. Bonincontro Morigia's chronicle covered the period up to 1349. The anonymous *Chronicon Estense*, dealing with the years 1095-1354, focused (as its title suggests) on the actions of the Este, the ruling family of Ferrara. Ferreto dei Ferreti, in addition to his *Historia*, also composed a poem on the origin of the Scaligeri, a Veronese dynasty. This was actually a panegyric devoted to the most illustrious member of the Scaligeri, Cangrande della Scala. The exploits of the Carrara of Padua were recorded in two vernacular works: the anonymous *Gesta magnified domus Carrariensis* in the late fourteenth century and the *Cronaca carrarese* by Galeazzo and Bartolomeo Gattari in the early fifteenth century.

Venice appears to have produced only two important chronicles in the later Middle Ages: one in French by Martino Canale, covering the period up to 1275; and one in Latin by the fourteenth-century doge Andrea Dandolo. But in Tuscany a profuse and distinguished historical literature, much of it in the vernacular, emerged during this period. The Dominican Bartolomeo Fiadoni, better known as Ptolemy of Lucca, composed, in addition to his theological and political writings, a set of annals dealing with developments in and around Lucca up to 1303. His terse Latin narrative contrasts with the fullness of the great Florentine chronicles produced shortly afterward by merchant writers. Dino Compagni, an active participant in the civic politics of his time who (like Dante) was exiled as a member of the White faction, composed a passionate denunciation of his enemies that developed into a very

detailed account of Florentine history between 1280 and 1310. The combination of his direct experience of the events he described and his commitment to a deeply felt view of these events enabled Compagni to bring them to life in a way few previous chroniclers had been able to do. It also enabled him to give his work a coherent literary form and a moral message, as a record first of the triumph and then of the discomfiture of evil. His younger contemporary Giovanni Villani was less intense in manner but also succeeded in the larger design of relating what had happened in Florence from its foundation onward, evoking events in all their reality and immediacy, and interpreting them so as to convey a concept of the moral purpose of history. Like Compagni, Villani took part in the government of his commune and was able to use the knowledge he derived from this experience, as well as from his international contacts as a merchant, to give his narrative a particularity of detail that had been rare in his predecessors. After Giovanni Villani died in 1348 (a victim of the black death), his brother Matteo continued his chronicle. In the later books of Giovanni's work and in the books written by Matteo, Giovanni's original optimistic vision of history was replaced by a growing gloom with regard to the disasters affecting both Florence and the financial and political fortunes of the Villani themselves.

The Villani brothers made an impressive contribution to the enrichment of the chronicle form, despite this change of mood—or perhaps in part because of it, since a salutary by-product was the development of more pragmatic criteria of judgment and explanation. They helped to transform the genre from one that had been concerned with recording facts, usually in the learned language of Latin, into one attempting a reflective and fully descriptive treatment of carefully observed events, written in a vernacular accessible to practical men interested in applying the lessons of the past to present realities. Florentine chroniclers of the later fourteenth century and the early fifteenth century, such as Marchionne di Coppo Stefani (who dealt with the period up to 1384) and Gregorio Dati (who dealt with the period between 1380 and 1405), were influenced by the example of the Villani. Their histories were on a much smaller scale, but like Giovanni Villani they attempted to make their narratives convey their moral and political ideals; and like Matteo Villani they adopted a more secular and

pragmatic formulation of these ideals than that inspired by the providential view of history still dominant in the early *Trecento*.

Elsewhere in Tuscany, vernacular chronicles that were less ideological, though nearly as much concerned with the details of historical incidents, also flourished in the fourteenth and early fifteenth centuries. Works such as the anonymous *Storie Pistoresi*, Raniero Sardo's *Cronaca di Pisa*, and Giovanni Sercambi's chronicles tracing the course of events in Lucca, as well as several similar Siennese examples, testify to the willingness of merchant writers to produce extensive accounts of their cities' histories. This tendency on the part of ordinary citizens to record significant past and present events also found expression in the domestic chronicle, in which authors such as Donato Velluti and Giovanni Morelli noted details of their ancestry and everyday lives. The domestic chronicle emerged particularly in Florence.

Increasingly, Italian became the language of chronicles, which thus answered the needs of the literate but unlearned for knowledge of the past of their city or family. It is true that, well into the fifteenth century, Latin continued to be used by some chroniclers, such as the notaries Giorgio and Giovanni Stella in their Genoese annals covering 1298-1435. But by this period a distinction was made between the works of the humanists, based on classical models, and works that followed the conventions of the medieval chronicle; and the latter—as a result of this distinction—came to be more generally composed in the vernacular. Works in this form had once expressed an essentially clerical culture and had become a means by which notaries, jurists, and mendicant friars recorded civic histories or the deeds of rulers. Now, the form became increasingly the instrument by which literate members of the merchant class celebrated and came to terms with their past and left an account of their actions and achievements for the benefit of later generations.

It should be noted that nearly all the works referred to here have been published in one or another of the following sets of sources: the old or new editions of L. A. Muratori, *Rerum Italicarum scriptores*, *Monumenta Germaniae Historica*-. *Scriptores*, *Fonti per La Storia d'Italia* (Istituto Storico Italiano per il Medio Evo).

Church Organization and Functions

Beginnings

The followers of Jesus of Nazareth, soon known as Christians, at first constituted a sect within Judaism, a religion tolerated in the Roman empire. The Christians believed that Jesus was the messiah promised in the Old Testament. Their primary mission, particularly after Pentecost, was evangelization among their fellow Jews. They paid little attention to organization, since the second coming of Christ seemed close at hand; however, Jesus himself had set up among his followers a group of

twelve— analogous to the twelve tribes of Israel—who continued to lead the community at Jerusalem after his death in A.D. 29. Most prominent among them were Peter and James the Elder. The community elected seven assistants, later known as deacons, and sent emissaries like Peter and Barnabas to other Christian communities. After his conversion, for example, Paul negotiated with Peter, James, and others of "the twelve" about the specifics of his mission to gentile believers. Until its destruction in A.D. 70, Jerusalem continued to be the center of Christianity, supported financially by other communities. Encyclical letters addressed to several communities and missionary visits maintained links among groups of Christians in Rome and, in particular, scattered through the eastern half of the Roman empire.

Toward the end of the first century, in Rome as well as elsewhere, the congregational leadership was shared by charismatics (teachers, apostles, and prophets) and local officials (elders or presbyters, a term from which "priest" was derived; bishops; and deacons) concerned with liturgy and administration. From the later second century on, these leaders were differentiated from the general congregation as clerics and eventually came to be known as major orders. The minor orders, including until the thirteenth century the subdeacon, were clerics such as acolytes, exorcists, lectors, and doorkeepers, depending on time and place. Only the major orders received ordination through the laying on of hands. Each diocese was headed by a communally elected bishop who supervised the clergy, celebrated the liturgy (eucharist), and admitted new Christians through baptism and controlled teaching. Regional meetings with other bishops, called councils or synods (these terms were equivalent until the twelfth century), resolved disciplinary, doctrinal, and administrative problems. Three decrees of the ecumenical Council of Nicaea (325) generally endorsed and described a system of ecclesiastical administration matching the administrative divisions of the empire: in each civil province the affairs of the church were to be administered by a synod of bishops headed by the metropolitan (archbishop), the bishop of the provincial capital. Like encyclicals, the councils were one means of maintaining unity, as was the gradual establishment of the canon of the scriptures. Major disputes were submitted to the patriarchal sees (Rome, Constantinople, Alexandria, Antioch, and Jerusalem), which had evolved as regional centers after

the destruction of Jerusalem. Even after Constantine moved the capital to Constantinople, Rome remained preeminent because both Peter and Paul were (and are) believed to have been martyred there. Moreover, the bishop of Rome, later called the pope, was seen as the successor of the apostle Peter (Matthew 16:c. 18f.) The concept of papal primacy, however, was a medieval development, and the principle of apostolic succession was valid for bishops everywhere. By the second century at the latest, the Greek word *ecclesia* (or citizen assembly; in English, church) was taken over into Latin (the predominant language in the west since the third century) and was used to designate the community of believers as well as the institutional, corporate structures and—not least—the place of assembly. Generous donations and bequests maintained the clergy and provided for extensive charitable support of widows and orphans as well as the ransom of prisoners.

The Church and Secular Power

Because the Roman religion was a civic religion (the emperor was also *pontifex maximus*), and Christians refused to participate in the imperial cult, their position in the Roman empire became a critical issue as early as the mid-first century. But despite intermittent persecutions—which were particularly violent beginning in the mid-third century—about 10 percent of the population of the Roman empire had become Christian by the time Constantine I (r. 306 or 307–337) was converted in 312, when he was victorious in the battle at the Milvian Bridge leading into Rome. Constantine's conversion marked a new era in the history of the church: there was close collaboration between the church and the Roman state, the *pax Augusta* was celebrated as a preparation for the birth of Christ, and the emperor was considered to be chosen by God and to be the equal of the apostles. Constantine's legislation not only undid the confiscations of property, the banishments, and the destruction that had taken place during the persecution but also granted the church and the clergy a privileged standing in Roman law: civil suits could be removed to the jurisdiction of a bishop; bequests to the church were legalized; manumissions performed in church before a bishop had full legal validity; Sunday was to be a day of rest;

disabilities for celibates or childless couples were abrogated; and the clergy enjoyed immunity from public duties and impositions. The Council of Nicaea of 325, convoked by Constantine to maintain the unity of the church in the face of the Arian heresy, is another example of the term "Caesaropapism," which connotes that the secular ruler is by divine grace also responsible for the church within his realm. This principle was generally accepted in the Byzantine empire (and later in Russia), but it was vigorously and successfully challenged in the medieval west, where barbarian kings were hailed as successors of Constantine and as late as the twelfth century Emperor Frederick Barbarossa (r. 1152-1190) could add laws to the *corpus iuris Iustiniani* as heir of the Roman rulers.

The Medieval Church

1. *The church and the barbarians.* The medieval period of the church can be said to begin with the pontificate of Pope Gregory I (590-604) and the expansion of Islam after 632. The churches of North Africa almost vanished; Rome and Constantinople alone remained among the patriarchates; and Germanic successor kingdoms were missionized: the Slavs from Constantinople and the Franks and Anglo-Saxons from Rome after initial Christian contacts through the British church of northern England, Wales, and Ireland. In contrast to Byzantium, western or Latin Christianity adopted Germanic as well as Irish features. Particularly influential were the proprietary church and the Irish (originally Egyptian) system of private penance. In the eighth century, an alliance between the Frankish Carolingians and the papacy was of equal importance with the Roman missions in the penetrating Christianization of this Gallo-Germanic-Slavic mixture of peoples on the European continent under Roman guidance. This meant as well the preservation of basic elements of Greco-Roman civilization, beginning with the Latin language.

2. *The papacy and the Franks.* The treaties of 754 between the Frankish king Pepin III (r. 751-768) and Pope Stephen II (r. 752-757) constituted additional legitimization for the Carolingians. These treaties also decisively shaped the history of the papacy as well as that of Italy.

On behalf of the papacy, the Franks defeated and replaced the Lombards as secular rulers in Italy. Also—and most importantly—they offered the papacy, which had become a regional Italian power in the hands of the local nobility, a means of asserting its independence from the Byzantine rulers (whose names disappear from papal documents after 781) and of furthering its own policies. The *constitutum Constantini* (Donation of Constantine), probably forged in the second half of the eighth century, was intended to attribute imperial rank to the popes and to endow them with sovereignty over vast territories in the western half of the old Roman empire. The coronation of Charlemagne (r. 768-814) by Pope Leo III (r. 795-816) in 800 as emperor and Augustus concluded this development from the perspective of the papacy. Much of Italy, with the partial exception of the papal states, became part of the Frankish (western) empire. Given the Constantinian inheritance, it is not surprising that Charlemagne and his son and successor, Louis the Pious (r. 814–840), contributed significantly to ecclesiastical developments. The basis for their interventions was the concept of a sacral kingship ruling on behalf of Christ: a theocratic monarchy. A Frankish king, and in particular Charlemagne, though not a priest, was more than simply a layman. His God-given duties as ruler very naturally included protecting the papacy; calling synods; reforming monasteries in accordance with the rules of Benedict of Aniane (Benedictine monasticism) or those of Chrodegang of Metz (regular cathedral canons); instituting churches and abbeys in recently conquered pagan Saxony; authorizing revisions of the Bible; issuing prescriptions for preaching; and establishing cathedral and monastic schools to train the clergy as well as the laity. These, of course, were in addition to his specifically secular duties. Jonas of Orleans, interpreting in Carolingian terms a letter of 494 from Pope Gelasius I (r. 492-496) to Emperor Anastasius, described the king and the priest as the two preeminent persons of equal rank within the one church, whose head was Christ.

3. *The Gregorian reform.* It might seem as if secular rulers had appropriated ecclesiastical functions, especially since they also appointed bishops and abbots. However, historians such as Fliche-Martin who present a view of "the church in the hands of the laity" tend to overlook the fact that, simultaneously, ecclesiastics penetrated the

secular sphere, creating a "state" in the hands of the priesthood. Such a state was nearly realized as early as the later years of the reign of Louis the Pious, but it was characteristic of the entire medieval period, when no neat categories can be applied. Ecclesiastical and secular affairs were closely intertwined; bishops were endowed with comital rights, including secular jurisdiction; and the predominant form of property consisted of fiefs, in the hands of both the spiritual and the secular nobility. The lords spiritual of the English parliament as well as the German ecclesiastical electors were an outcome of these developments, and Thomas Becket is a famous illustration of the principles involved. In the late ninth century and the tenth century, Saracen and Magyar invasions put an end to such abstract preoccupations until the Carolingian ideological inheritance was picked up by the East Frankish—i.e., German, Ottonian, and Salian—rulers. They asserted, once again, a strong leadership in the church; and in the Salian period under Emperor Henry III (r. 1039-1056) they also had a guiding role in the growing ecclesiastical reform movement, directed originally against moral and disciplinary failings within the church, simony, and ecclesiastical marriage. Henry III carried the reform to Rome in 1046, when the council of Sutri—which he had convoked—dealt with disputes surrounding the papacy. At the time, two predecessors of Pope Gregory VI could, strictly speaking, also have claimed the papacy. Under Henry's influence, Gregory VI and both his rivals were deposed or resigned, under pressure at Sutri or at a council that followed three days later in Rome (23 December 1046).

The reformed papacy was freed from dependence on the local Roman nobility, regained its international standing, and resonated so strongly throughout Latin Christendom that Pope Gregory VII could direct his own thoughts once more to Constantinople. Gregory wanted to aid Byzantium against its enemies by leading a crusading army to the east; this was certainly a step toward resuming amicable relations with the Byzantine church, which had broken off in 1054, during the pontificate of Leo IX. (Leo had sent Cardinal Humbert to Constantinople; Humbert, having failed to secure the submission of the Greek church to Rome, had excommunicated its patriarch.) The eastern and western churches were split by doctrinal differences concerning the use of unleavened bread, the *filioque*, and married clergy, as well as by the

demands for primacy which were put forward by the reformed papacy with some recourse to the Donation of Constantine. In 1076 and 1080, Pope Gregory VII deposed and excommunicated Henry IV, the son and successor of Emperor Henry III, over the question of royal investiture of bishops and abbots; this episode, too, reflects the assertion of leadership in the Christian world by the reformed papacy. When Henry IV capitulated at Matilda's fortress of Canossa in 1077, theocratic kingship as it had been known in the earlier Middle Ages came to an end. The ruler, a layman, was described in Gregory's letters to Hermann of Metz as far lower in rank than even the lowliest clerical doorkeeper. Obedience to the papacy became a dogma of the church. At the same time, the pope, as the successor of Peter, became the head of a strictly conceived ecclesiastical hierarchy; this concept eventually led to that of a papal monarchy.

4. *The supremacy of the church.* The papal election decree, formulated by the Lateran Council of 1059, stipulated that instead of the customary election by the Roman clergy and people, the cardinal bishops were to be the leading electors; thus the decree excluded local and lay influences. The papal bureaucracy—known, since the later eleventh century, as the curia—was centralized and expanded; the financial organization of the church was improved and became increasingly sophisticated; canon law evolved into a scientific discipline taught at the nascent universities, especially Bologna; and scholasticism developed. These changes supported the increased power of the papacy, which under Innocent III (r. 1198–1216) had become strong enough to make King John of England its vassal and, in turn, to protect him against internal and external opposition. During the crisis of the double election of 1198 to the Holy Roman Empire, Innocent III—as the recognized leader of Christendom—formulated the canonical thesis that imperial dignity originated in and depended on the papacy. Innocent demanded the right to approve candidates even for the German kingship, since a king, once elected, would have a claim to the imperial crown. His arguments were based on the higher dignity of the priesthood and the recent theory of the translation of the empire by the papacy from the Romans to the Franks and Germans; the pope felt as responsible for other rulers and the emperor, once crowned, as for any Christians "by reason of sin" (*ratione peccati*). The Fourth Lateran

Council, an ecumenical council held in 1215, was the high point of Innocent's pontificate, and of the standing of the papacy in the medieval Latin west. Constantinople had been occupied by crusaders in 1204, and a healing of the schism with the Greek Orthodox church could be hoped for. One of the Lateran decrees formulated the doctrine of transubstantiation with regard to the eucharist. Another sacrament addressed by this legislation was penance: the council imposed on all Christians confession at least once a year before Easter in preparation for communion.

The use of indulgences by the church arose in connection with these changes in penitential practices; indulgences were meant to ease the burden of penance by allowing penitents to substitute monetary payments. The money was used for ecclesiastical purposes such as the crusades or the building of churches. In the thirteenth century, the granting of indulgences was justified by the theory of a "treasury of merits" which the papacy had accumulated since its founding by Christ. During the first Holy Year, the jubilee of 1300 celebrated in Rome by Boniface VIII (1294-1303), indulgences were granted on a large scale to pilgrims who came there.

Along with its recognition and regulation of the new monastic orders of Dominicans and Franciscans, which were (in contrast to the Benedictines) on principle active in urban settings and at the universities, the church had accommodated many of the social and religious needs of the rapidly growing urban populations. The faith and devotion of townsmen, from lowly artisans to entrepreneurs, are represented by the marvelous Gothic cathedrals north of the Alps, although in Italy the Romanesque style continued to predominate until the Renaissance. Popular piety had a tendency to become increasingly subjective and emotional, reaching beyond the ancient formulas of the Latin liturgy to express itself in extreme ascetic practices and in the veneration of miracles. The papal Inquisition entrusted the Dominicans and Franciscans with the suppression of heresies.

5. *The breakup of western unity.* In 1303, the defeat of Pope Boniface VIII at Anagni by Philip the Fair of France greatly weakened the papacy, which now came under French domination. From 1309 to 1377, the popes, who themselves were often French or from territories influenced by France, resided at Avignon. This "Babylonian captivity" of

the church was followed by the Great Schism, when there were rival popes in Rome and in Avignon (1378-1415). This disorder was an impetus for the conciliar movement. In their attempts to heal the schism, conciliar theorists held that a general council was the supreme earthly representative of the church. The Council of Constance (1414-1418) was largely a victory for such views. It ended the schism, proclaiming conciliar authority over the papacy. However, the hope of reforming the church and restoring unity by condemning the teachings of the Bohemian reformer John Hus (who was burned at the stake) was in vain. The clamor for reform, as expressed in the Protestant Reformation, was to break up the medieval Catholic church.

Cicero

Marcus Tullius Cicero (105-43 B.C.) is one of the most important figures in Roman antiquity and one of the most influential men in the history of western civilization. He was born in Arpinum and attended schools

of philosophy and rhetoric in Rome and Greece. He became a quaestor (in Sicily) in 75 B.C. and a praetor in 66. In 63 he was elected consul and was able to suppress Catiline's conspiracy. Accused by Publius Clodius of having ordered the execution of five conspirators without giving them the right to a trial, he left Rome for exile in Macedonia, whence he returned in 57. Although Cicero was a republican and a great admirer of Pompey, he was in favor of Caesar, who had formed a triumvirate with Pompey and Crassus. In the first months of the ensuing civil war, Cicero was not in Rome. When Pompey left Italy, Cicero did not follow him. In 49, Cicero met with Caesar, showing some indecision yet refusing to go back to Rome to join the senators and support Caesar. Instead, after some further uncertainty, he left for Greece. He was not at the battle of Pharsalus. On his return to Rome, he opposed Antony and favored Octavian. Octavian, however, formed a triumvirate with Antony and Lepidus, and at Antony's request Cicero was condemned to die (7 December 43).

Although Cicero wrote some poetry, his works are usually categorized in four other groups: rhetoric, philosophy, orations, and letters.

To the first group, rhetoric, belong *De inventione*, *De oratore*, *Brutus*, *De optimo genere oratorum* (or *The Orator*), *Partitiones oratoriae*, and *Topica*. *De oratore*, in which he discusses the education of an orator, is perhaps the most important example of this kind of literature. In *Brutus*, he gives a short history of Roman oratory; in *The Orator*, he attempts to represent the perfect orator.

Cicero's philosophical works (the second general category) are of two kinds: political-philosophical and philosophical in the stricter sense of the word. *De republica* and *De legibus* (*On Laws*) are political-philosophical; in these works, Cicero describe a government that should combine the best of three forms—monarchy, democracy, and oligarchy. In *De legibus* he explains the basic principles that must be accepted in order to ensure an ideal state. *Somniurn Scipionis* (*Dream of Scipio*) is part of *De republica* and was preserved by Macrobius in his commentary; it has come down to us as an independent work.

In his more strictly philosophical works, Cicero follows the doctrines of the Stoics, the Epicureans, and the Platonic academy (he admired Plato); yet he says (*De officiis*, 1.6) that that he will also express and

defend his own opinions. Two of these works are lost: *Consolatio* and *Hortensius*; the latter had a great influence on Saint Augustine's conversion (*Confessiones*, 3, 4, 7). Cicero's surviving philosophical works include *Academica*, *De finibus* (*Of Ends*), *Paradoxa Stoicorum*, and *Tusculan Disputations*. Of these, *Tusculan Disputations* deserves particular attention for the intensity and sincerity with which Cicero expresses his thoughts; stylistically, some passages are among the best in his philosophical works.

In two other philosophical works—*De natura deorum*, and *De divinatione*—Cicero addresses theological problems and expresses the opinions of various philosophical schools concerning the nature of the gods. He treats the problem of man's free will in *De fato* (*On Fate*). His *Cato maior* and *De amicitia* (*On Friendship*) derive from the Greek Stoic Panaitios. In *De officiis* (*On Duties*), Cicero gives his son precepts for proper behavior.

Among his contemporaries, Cicero had a great reputation for oratory. His orations (the third category of his works) show that he had mastered this art like no one else in Roman history and was completely able to adapt his style to various circumstances. He could be decisive and abrupt, as in his orations against Catiline, *In Catilinam*; or he could be persuasive and polite, as in *Pro Archia*. Thirty-eight of Cicero's orations have been lost, but fifty-eight, some of which are fragmentary, have come down to us: *Pro Quintio*, *Pro Roscio Amerino*, *Pro Roscio comoedo*, *In Caecilium divinatio*, *In Verrem*, *Pro Tullio*, *Pro Fonteio*, *Pro Caecina*, *Pro lege Manilla*, *Pro Cluentio*, *Contra Rullum*, *Pro C. Rabirio*, *In Catllinam*, *Pro Murena*, *Pro Sulla*, *Pro Archia*, *Pro Flacco*, *Post reditum ad Quirites*, *Post reditum in senatu*, *De domo sua*, *De haruspicum responso*, *Pro Sestio*, *In Vatinius*, *Pro Caelio*, *De provincia consulari*, *Pro Balbo*, *In Pisonem*, *Pro Plancio*, *Pro Rabirio Postumo*, *Pro Milone*, *Pro Marcello*, *Pro Ligario*, *Pro Rege Deiotaro*, and *Philippicae* (1-14).

Cicero's letters (the fourth general category of his works) are of great importance. These are subdivided into four groups: *Ad familiares*, *Ad Quintum fratrem*, *Ad Atticum*, and *Ad Brutum*. All of them are valuable for the study of Cicero's personality and for his descriptions of illustrious people and significant events in Rome.

As noted above, Cicero also wrote poetic works. These include his

translation of the *Pbaenomena* of Aratos, in hexameters; his original compositions in *De consulatu* (*On Consulship*) and *De temporibus suis* (*On His Times*) in which he praises his own activities in politics; and an epic poem, *Marius*.

Cicero had a great influence in the Middle Ages. In the seven liberal arts, he represented rhetoric, and therefore his rhetorical works were preserved. *De inventione* and the pseudo-Ciceronian *Rhetorica ad Herennium* were well known. Augustine, Boethius, Cassiodorus, Isidore of Seville, Alcuin, and Rhabanus Maurus were acquainted with Cicero's rhetorical works. In the eleventh century, Lupus of Ferrières wrote to the pope in Rome requesting a copy of *De oratore* so that he could correct and complete his own copy. Gerbert of Aurillac (later Pope Sylvester II) was particularly interested in Cicero's rhetorical works and orations; this may explain why the orations were preserved in France. Cicero also influenced the philosophical thought and works of some church fathers. Minucius Felix in *Octavius*, Lactantius Firmianus in *De opificio Dei*, and Saint Ambrose in *De officiis clericorum* follow Cicero closely. As mentioned earlier, *Hortensius* influenced Saint Augustine's conversion. Saint Jerome had a famous dream in which, when he came to be judged after death, he was accused of being *Ciceronianus* rather than *Christianus*.

During the Renaissance, Cicero was also known in the political world. Petrarch's discovery of Cicero's letters to Atticus (Verona, 1345), in which Cicero revealed very human aspects of his personality, such as his uncertainties, added a new dimension to the image of Cicero. The discovery of another group of letters (*Epistulae adfamiliares*) prompted Salutati to express admiration for Cicero as a statesman who had taken part in the civil war and had seen the disappearance of freedom in Rome. P. P. Vergerio, L. Bruni, G. Barzizza, and Sicco Polentone were greatly interested in Cicero. In the *Quattrocento*, Cicero became a focus of attention by the humanists, with regard to a well-known question about the two "moments and aspects" of the Latin language, i.e., which language had been spoken by the Romans, and which should now be learned. For some humanists—the purists—Cicero represented the best model of language, which they tried to imitate. Other humanists—the archaists—preferred as models the authors of early Latin literature. Still others—the eclectics—tried to create an original style based on imitation

of all the best Latin authors. The humanists in Rome developed a special movement, claiming that the perfect style in Latin was Cicero's and that, for them, the imitation of Cicero, Ciceronianism, was the best way to make contact with the traditions of the ancient Romans. Ciceronianism was opposed by several humanists, especially by Erasmus in his work *Ciceronianus*.

Ciconia, Johannes

Johannes Ciconia (c. 1370-1412), a musician of northern origins, became perhaps the most important figure connecting the *an nova* of the *Trecento* and the Renaissance or protoRenaissance styles that emerged in the *Quattrocento*. His biography has been a battleground for scholars. In her exhaustive study of his life and work, Clercx (1960) constructed an extended chronology according to which he was born in Liege c. 1335, served the papal court at Avignon from 1350 on, traveled in Italy during 1358-1363, returned to Liège in 1372, and then finally settled in Padua in 1403, where he remained until his death in 1412. Later discoveries and reinterpretations by other scholars, however, indicate that this chronology confused the lives of two or three different people of the same name. It is now accepted that the composer Ciconia was born c. 1370 (apparently he was the illegitimate son of a priest), and he is documented as a choirboy in Liege in 1385. By 1390, Ciconia was a musician in Rome, during the reign of Pope Boniface IX. In 1401, he went to Padua, where he served at its cathedral and university until his death in 1412; one of his chief patrons there was the great Paduan scholar and prelate Francesco Zabarella.

Ciconia was not only a musician but also a poet and theorist; he wrote several theoretical treatises. As a composer, he left a substantial and significant legacy of surviving works: twelve movements of the mass, fourteen polytextual Latin motets, two French *virelais*, four Italian madrigals, and seven Italian *ballate*, plus several miscellaneous and uncertainly attributed pieces. He was trained in the French *ars nova* style but obviously also encountered distinctly Italian *ars nova* practices, and as a result he developed a progressive synthesis of his own. In his French music, as well as in some of his Latin polyphonic pieces, Ciconia demonstrates a commitment to the intricate techniques of French *ars subtilior*, and in his settings of Italian texts he assimilates the Italianate lyricism of the Tuscan school but also infuses it subtly with French structural procedures.

By contrast, Ciconia built his complex polyphonic motets, with their multiple texts and their very northern isorhythmic counterpoint, around individual melodic lines, some of which were first conceived as Italianate songs. Through such compositions, Ciconia helped to introduce the motet style in the Italian musical scene. In his movements for the mass, he gave the upper parts remarkable melodic freedom; and

he was one of the earliest composers to draw a clear distinction between passages for solo singers and those for the full choral ensemble. In all, both in his technique and in his Franco-Italian fusion of idioms, Ciconia is recognized as the founder of what can be called a new "international Gothic" style that would take shape during the fifteenth century. The elegant intricacy and beauty of his music can still appeal to us. Ciconia's career also prefigures a pattern of the following 150 years, during which Italian courts and cultural centers were eager to import and patronize "Netherlandish" Franco-Flemish northerners (beginning with Guillaume Dufay), in preference to native Italian musicians, as musical stars and pacesetters.

A number of Ciconia's compositions were written as occasional pieces for specific patrons and situations. An early canonic composition with a French text may have been dedicated to Gian Galeazzo Visconti. One madrigal was written in honor of the city of Lucca; another madrigal and one of the motets praise members of the Carrara family, then reigning in Padua; one *ballata* may mourn the death (1406) in prison of the last Carrara lord. Among Ciconia's motets, two are dedicated to Francesco Zabarella; a third commemorates the submission of Padua to the Venetian republic, negotiated by Zabarella after the overthrow of the Carrara (1406). Another motet praises Doge Michele Steno, architect of the Venetian takeover, and two others apparently commemorate the installation of two Venetians as successive bishops of Padua—Albano Michiel (1406) and Pietro Marcello (1409). Still another motet may also be in honor of Pietro Marcello or, alternatively, of the antipope Benedict XIII.

Cielo D'alcamo

The *Contrasto* (*Rosa fresca aulentissima*), preserved only in the Vatican Codex (Vat. Lat. 3793), bears no attribution; the author's name, Cielo d'Alcamo, is recorded solely by a sixteenth century philologist, Angelo Colocci. This name indicates that the poet came from Alcamo, a township between Palermo and Trapani. Internal evidence places the composition between 1231 and 1250.

Both geographically and chronologically, then, the poem fits into the Sicilian school, yet its subject matter, an amorous contrast between a young woman and her seducer, has nothing in common with courtly *canzoni*, from which this poem also differs significantly in style and versification. *Contrasto* has a certain resemblance to a transalpine poetic genre—the French (and Provençal) *pastorelle*—but it lacks some of the most important features of that genre: it has no shepherdess and no accidental encounter in the field, and there is no social difference between the protagonists. *Contrasto* has been interpreted as a mime, intended to be either recited or sung. The meter, consisting of three monorhymed alexandrines followed by two hendecasyllables, is not lyrical, but neither is it necessarily popular. What is popular, however, is the dialogue form: the poem is made up of alternating remarks exchanged between the seducer and the woman. The repetition of some elements of the last distich in the opening line of the following stanza, while essentially a lyrical feature, serves to tie the dialogues together more clearly, perhaps for the benefit of the listeners.

In *De vulgari eloquentia*, Dante cites a passage from *Contrasto* as an

illustration of what he calls a "mediocre"—that is, uncourtly—style. The language is essentially the same as that of the Sicilian school, and the text contains the usual Sicilian rhymes: *e* with *i* and *o* with *u*. Other features, while characteristic of the south, are not at all insular; these features include the assimilation of *nd* to *nn* (*monno* for *mondo*), the use of *b* for *v* (*bolontate*, *abere*), and sporadic occurrences of the diphthongs *ie* and *uo* (*castiello*, *nuovo*). This linguistic hybridism makes it impossible to determine the exact geographical origin of the text. The base is Sicilian, but with some continental, specifically Neapolitan, overlay, perhaps attributable to the transmission process. However, the various linguistic features found in *Contrasto* have never been encountered together in any single dialect. For this reason, some scholars conclude that the mixture of *siciliano illustre* and popular elements suggests that the poet's intention was a caricature, or parody.

Cimabue

The Florentine painter Cenni di Pepe (or Bencivieni di Pepo, c. 1240-c. 1302) is commonly known by his nickname, Cimabue, connoting buliheadedness. He is generally said to have marked the division between the art of the Middle Ages and the Renaissance by recalling painting to the task of imitating nature. Cimabue was a Florentine by birth, but his activity stretched from Bologna southward to Rome and Assisi, and west to Pisa. Biographical information on Cimabue (the *Ottimo commento* on the *Divine Comedy*, Villani, 1381-1382; and Vasari, 1550-1564) is scanty and unreliable, and specific documentation of his work is almost nonexistent. The earliest archival mention of Cimabue is from June 1272, when *Cimabue, pictore de Florentia* was witness to the signing of a legal contract in Rome. Besides this, the only other documentation of the artist comes from Pisa, thirty years later. Between September 1301 and February 1302, Cimabue was commissioned to complete the apse mosaic of Christ Enthroned in the cathedral of Pisa (begun by Maestro Francesco) with a figure of Saint John the Evangelist. Also in 1302, Cimabue and a Giovanni di Apparecchiato were commissioned to paint a panel (now lost) for the hospital church of Santa Chiara in Pisa. The Saint John in the cathedral of Pisa is Cimabue's single surviving documented work; it provides such a frail scaffold on which to hang an artistic career that German scholars in the early twentieth century thought Cimabue to have been a legendary figure. A number of works survive, however, which correlate stylistically with the figure of Saint John; and most recent scholars agree that these constitute a core body of works definitively attributable to Cimabue.

Vasari, who considered Cimabue the founder of Italian painting (his sequence of *Lives* begins with a biography of Cimabue), observed that although Cimabue imitated the work of the Greeks very well, he greatly improved on their art, eliminating a great deal of their awkwardness. Most scholars today agree that this was a perceptive

characterization, for although Cimabue is typically seen as the last important practitioner of the Italo-Byzantine manner, he made enormous advances in naturalistic representation.

One of Cimabue's earliest surviving works, the *Crucifix* above the high altar in San Domenico at Arezzo (1260-1265), continues the *Christus patiens*, a type of crucifixion popularized by Giunta Pisano in the 1230s and repeated by Florentine artists such as Coppo di Marcovaldo. Cimabue's *Crucifix* is in fact closely patterned after Giunta Pisano's *Crucifix* (1250s) in San Domenico in Bologna, the mother church of the Dominican order. In both works, the historiated apron (that is, an apron decorated with figures such as people and animals), typical of earlier crucifixes, is replaced by a patterned border that enhances the focus on Christ; and half-length figures of Mary and John the Evangelist are placed at the ends of the crossbar. In Cimabue's *Crucifix*, as in Giunta's, the segmentation of the body and the gold-striated drapery of Christ's loincloth are extremely stylized; but Cimabue intensifies the death agony expressed in the figure of Christ through a more emphatic sway of the body almost to the edge of the apron, and a more severely inclined head, emphasized by a halo, far left of the central vertical axis of the cross.

Cimabue's *Crucifix* for the Franciscan church of Santa Croce in Florence (c. 1285; it was severely damaged when the Arno flooded in 1966) at first sight conforms to the familiar type of suffering Christ, but it incorporates a degree of change and innovation unprecedented in *Duecento* art. The schematization of Christ's body that was still seen in the Arezzo *Crucifix* has here become so subtle that for the first time the body seems covered by a flexible, continuous integument of skin; the loincloth loses its gold striation to become a naturalistically rendered, nearly transparent veil through which we sense Christ's form. Even the gold highlights of Mary's and John the Evangelist's drapery at the end of the cross arm have been minimized. Most important, Christ seems manifestly present; his thumbs and toes extend beyond the painted borders of the cross, and his body now seems less rigid, its weight pulling his arms taut and wrenching his torso beyond the margin of the apron. This pathetically suffering, human Christ must have reflected the work's patronage: the Franciscan order emphasized the immediate, accessible, and human aspect of the deity, and this emphasis very likely

led Cimabue to rethink the subject of the crucifixion.

Innovation is also seen in the *Madonna and Child Enthroned* made for the high altar of the Vallambrosan church of Santa Trinita in Florence. This was an old theme, but it had risen in popularity as devotion to Mary increased in the twelfth and thirteenth centuries, and a number of important *maestà* altarpieces by Tuscan artists such as Coppo di Marcovaldo and Guido da Siena had preceded Cimabue's. No previous *Madonna Enthroned* prepares us, however, for the sheer scale of Cimabue's, which is twice as large as some other examples. An impression of monumentality is conveyed not only by the size of the composition but also by the enormous three-tiered throne that dominates it. Cimabue's contemporaries were accustomed to seeing only a modest throne in a *maestà*, and they must have been astonished by the unprecedented complexity of Cimabue's representation, and by the unmistakable suggestion of spatial recession and volumetric form. For example, the feet of the lowest pair of angels are firmly planted on the first stage of the throne, where the floorboards seem to converge in perspective to the center. The bases of applied columns fronting the throne are carefully depicted as three-dimensional solids, and the body of the Christ child is convincingly articulated through the folds of his tunic and pallium. Even the traditional iconic remoteness of the Madonna is softened by the glimmer of a smile. Curiously, though, such naturalism is not carried through consistently; or perhaps one might more accurately say that naturalism is denied just as trenchantly as it is affirmed. The base of the massive throne is explicitly defined but is given no rear support; the rounded colonnettes become flat along the length of their shafts; the angels above the pair standing on the platform float indeterminately in space; the Madonna is flattened into a shimmering apparition with no coherent structure; and although some heads are given a three-quarter turn, Cimabue insists on depicting both ears as if seen frontally.

Cimabue's greatest surviving cycle of works is the series of frescoes (at one point badly disfigured by chemical corrosion over much of the surface) in the transept and presbytery of the upper basilica of San Francesco in Assisi. These frescoes were most likely executed, with considerable participation by workshop assistants, during the papacy of either of two Franciscans: Nicholas III Orsini (1277-1280) or Nicholas IV

Masci (1288-1292). The cycle was designed as a Franciscan pantheon, testifying to the saint's special devotion to Maty, the apostles (especially Peter and Paul), the angels (Michael and his role in the Apocalypse foremost among them), and Christ's passion. The cycle runs parallel to themes stressed in the officially sanctioned biography of the saint by Bonaventure. The left transept is devoted to apocalyptic narratives, such as *Christ of the Apocalypse*, *Vision of the Four Angels*, *Vision of the Throne and the Book of Seven Seals*, *Fall of Babylon*, *Saint John on the Island of Patmos* (or possibly *Saint John Receiving the Vision of the New Jerusalem*), and *Saint Michael Expelling the Rebel Angels*. The left transept also includes a huge *Crucifixion*, covering the entire east wall; this *Crucifixion*, with its energy and dramatic intensity, is one of the most powerful conceptions of the theme in European art.

The apse frescoes depict scenes from the life of the Virgin: *Annunciation to Joachim*, *Joachim's Offering*, *Birth of the Virgin*, and *Marriage of the Virgin* in the lunettes; and *Death of the Virgin*, *Dormition*, *Ascension*, and *Christ and the Virgin Enthroned* on the lower walls. The right transept contains scenes of the apostles Peter and Paul in the main walls: *Saint Peter Healing the Lame Man*, *Saint Peter Healing the Sick and Possessed*, *Fall of Simon Magus*, *Crucifixion of*

Saint Peter, and *Beheading of Saint Paul*. Another large *Crucifixion* flanking the version in the left transept covers the east wall, but it has little of the force or vitality of its counterpart and therefore is considered—as are the rest of the frescoes in the right transept—to be largely workshop production after Cimabue's designs.

Despite their variety of narratives and decorative elements, Cimabue took great pains to give the frescoes in San Francesco overall unity as a program. This work—one of the first and most ambitious of such efforts—successfully conveys the impression that the east end of the church is, in terms of its decoration, a single cohesive entity.

Other works often attributed to Cimabue and his workshop include some of the mosaics in the Baptistery in Florence, a fresco of the *Maesta and Saint Francis* in the lower basilica of San Francesco at Assisi, a *Maesta* from San Francesco in Pisa (now at the Louvre in Paris), and a *Maesta* from Santa Maria dei Servi in Bologna.

Cino Da Pistoia

The jurist and poet Cino, or Guittoncino, da Pistoia (Cino dei Sighibuldi, c. 1270-c. 1336 or 1337) was born in the prosperous city of Pistoia, some 20 miles (32 kilometers) northwest of Florence. His father, Francesco dei Sighibuldi (Sinibuldi, Sigisbuldi), was a notary who belonged to one of the older and powerful families of Pistoia, adherents of the Black faction. Cino's mother, Diamante, was the daughter of the well-known physician Bonaventura di Tonello. We know very little about Cino's early life except that for five years he was the pupil of Francesco da Colle, who provided excellent instruction in grammar and the classics. Cino may have begun his legal studies in Pistoia in 1279-1284, under Dino dei Rossoni of Mugello; he then went to Bologna to continue his studies and remained there, in all probability, from 1284 to 1292, because the normal course for a law degree required eight years. The period in Bologna was critical for Cino's development both as a jurist and as a poet. He benefited from the lectures of Francesco d'Accursio and Lambertino Ramponi. In Bologna, Cino felt the lingering poetic influence of Guido Guinizzelli and Guittone d'Arezzo, as well as that of Onesto degli Onesti, with whom he exchanged several sonnets. Perhaps during these years in Bologna Cino met Dante, who visited there in 1287. The first textual evidence we have of their friendship is Cino's *canzone Avegna che io aggia più per tempo*, written to console Dante on the death of Beatrice (1290).

In 1292-1294, Cino may have traveled to France (in particular, to Orléans and Paris), for in his major juridical work, *Lectura in codicem*, he makes specific references to the legal writings of Frenchmen such as Pierre de Belleperche and Jacob da Revigni, both of whom taught at Orleans. In an unedited *consilium*, Cino refers to Belleperche as *doctor meus* ("my teacher"), the same phrase he used for Dino dei Rossoni.

Returning to Italy, Cino probably went first to Bologna. He stayed there as a lecturer in the *studium* for several years, at least from 1297 to 1301 or 1302. During this period Cino most likely made the acquaintance of the Bolognese poet Gherarduccio Garisendi, with whom he exchanged several sonnets and with whom he vied for the affection of a woman, probably Selvaggia, who is described as being

dressed in black, perhaps in mourning for her husband, Giovanni de' Cancellieri, nicknamed Focaccia. Selvaggia's actual identity—was she a historical figure or a literary fiction?—has been debated for many years, but this issue is not crucial, or even important, to a critical evaluation of Cino's poetry. Many of Cino's lyrics were written to praise a woman (to whom he refers using the *senhal* Selvaggia), to lament her lack of compassion, to express the alternate joy and anguish of the poet-lover's experiences, and to mourn her death. The object of Cino's affection may have been a member of the Vergiolesi family who, as a member of the White faction, was exiled in 1306 and died sometime between 1307 and 1309. However, what matters is not the historical woman but the transcendent literary persona represented in Cino's lyrics—a literary space in which she lives, moves, and acts, becoming a figure not dissimilar to Dante's Beatrice or Petrarch's Laura.

Cino's production of lyrics is the largest among the poets of the *dolce stil nuovo*. His twenty *canzoni*, thirteen *ballate*, and 134 sonnets (including fragments) reflect virtually all the major themes, images, and concepts of that style. Because of the emotional fervor of Cino's lyrics and their unusual spatial orientation, critics have taken his poetry—erroneously—as a rich repository of autobiographical data. And even though these elements are obviously literary rather than autobiographical, they go beyond the standard conventions and give Cino's poetry its distinctive character. Thus, while we cannot, on the one hand, reconstruct Cino's biography on the basis of his lyrics, we can and must, on the other hand, read and understand them as an integral part of his literary corpus. He fashioned his lyrics to reflect the psychological contours and recesses of the persona of a poet-lover who is at once the same as and different from himself, presenting the broad range of a person's affective life in an objectified and conventionalized manner yet ostensibly offering a subjective account of these experiences. This tension provides the dynamic force of the corpus as a whole.

After Selvaggia's death, Cino was attracted to various other women, for and about whom he wrote lyrics. Indeed, Dante reproves Cino for his amatory habits in the sonnet *lo mi credea del tutto esser partito*, and this view was shared by other poets.

In 1302, Cino returned to Pistoia, where he married Margherita di

Lanfranco degli Ughi, whose family belonged to the White faction. Since Cino's family belonged to the Black party, the marriage was probably contracted in an attempt to establish peace between the two factions, at least at the level of individual families. Cino and Margherita had five children: one son—Mino—and four daughters. At the time of Cino's return to Pistoia, the city was in the throes of civil strife, and in 1303 he went into forced exile. After returning from exile in 1306 (on 11 April), Cino was elected judge of civil suits (*assessore di cause civilz*), and some of the cases he adjudicated eventually found their way into his legal writings. In addition to his lyrics on amorous topics, Cino's *canzoniere* is especially rich in *tenzoni* and in poems inspired by local partisan strife and political exile.

During the first decade of the *Trecento* Cino's friendship with Dante flourished, as several *tenzoni* on amorous topics attest. Dante praises Cino as the poet of love par excellence in *De vulgari eloquentia* (2.2.8), citing in particular the following *canzoni*: *Digno sono eo di morte*, *Non spero che giamai per mia salute*, and *Avegna che io aggia piu per tempo*. Dante also addressed a letter (*Epistola* 3) to Cino, the *exulanti Pistoriensi* ("Pistoian in exile").

In addition to their literary affinities, Cino and Dante were united in

their fervent support of Henry VII of Luxemburg, who was elected Holy Roman emperor on 27 November 1308 and represented the best hope for peace among the various warring factions in Italy. In June 1310, Henry sent Ludwig of Savoy as his personal ambassador to Rome to begin the preparations for his incoronation. Ludwig asked Cino to accompany him: first to Florence in a attempt (which turned out to be futile) to have the Florentines yield to Henry; and then to Rome, where Cino would serve as adviser to the imperial tribunal, a service which he mentions in his legal writings. On 24 August 1313, Henry VII died, probably of malarial fever, at Buonconvento near Siena, thus dashing Cino's and Dante's hopes for political peace and unity under the imperial aegis. The solemn *canzone* *Da poi che la natura ha fine posto*, written to commemorate the death of Henry, conveys Cino's sense of loss and desolation. Cino also wrote the moving *canzone* *Su per la costa, Amor, de l'alto monte* to commemorate the death of Dante.

While Henry's death marked the end of Cino's active involvement in partisan politics, it did not diminish his firm adherence to Ghibelline ideals, and this may be clearly seen in his legal writings. On 11 June 1314, probably in Pistoia, Cino completed *Lectura in codicem*, his great commentary on the first nine books of the Justinian code of laws. He had been working on this commentary desultorily since the last decade of the thirteenth century and had finally succeeded in assembling it in final form in two years. On 9 December 1314, he successfully completed a public examination (the *conventus*) and was awarded, in Bologna, a doctoral degree in legal studies. In the diploma, Cino is called *sapientissimus et eloquentissimus vir* ("a very wise and eloquent man").

As a lawyer and teacher, Cino was active in Florence, Macerata, Siena, Bologna, and Perugia. In 1324 in Bologna, Cino probably met Petrarch, who was a student in the *studium*. Cino, having earned a great reputation through his legal writings and lectures, was much sought after to add luster to the *studia* in other Italian cities. On 15 August 1330, Robert of Anjou invited Cino to teach civil law at the university in Naples, but Cino remained there for only one year. Some reasons for his brief stay may be found in the satirical poem *Deh, quando rivedro il dolce paese*, in which he rails against the vile untutored citizenry, the enviousness of his legal colleagues, and the generally disreputable nature of the city. Robert—although he may have

considered Cino, and Cino's political beliefs, distasteful—held *Lectura in codicem* in high esteem, acquiring a personal copy in 1332.

During the last four years of his life Cino was in Florence, Perugia, and Pistoia. In Pistoia on 13 July 1334, he was elected *gonfaloniere* (standard-bearer) for August and September. Perhaps because of ill health, he resigned that post, but on 31 March 1336 his fellow citizens elected him to the *consiglio del popolo* ("council of the people") for a six-month term. After the first signs of his final illness began on 12 December 1336, Cino made his will on 23 December. He died shortly thereafter, either in late December 1336 or in early January 1337. Because Cino's son Mino had died earlier, Mino's son Francesco—Cino's grandson—was named an heir, with Cino's four daughters (Diamante, Giovanna, Lombarduccia, and Beatrice) as *legatarie*. Cino was buried with honor in the cathedral of San Jacopo of Pistoia, and a funereal monument was erected near the altar of the Porrine in 1337. In the sculptural relief Cino is remembered as a teacher (twice), but not as a politician, jurist, or poet.

Nevertheless, it is for his poetry that Cino is most often remembered. In addition to his synthesis of various stilnovistic elements, Cino's basic contribution to the lyric tradition was his objective psychological realism, which manifested itself in the intensely personal, almost confessional tone of his poems; and in this regard he serves as a bridge between the *dolce stil nuovo* and Petrarch. Because of his extreme versatility as a poet, Cino was able to mediate among various "schools" and individual poets, compose lyrics in a number of modes and styles, and ultimately profit from and contribute directly to the several major literary currents of his time. Cino enjoyed literary and personal friendships with the greatest contemporary Italian poets, all of whom regarded him with much admiration: in addition to Dante's praise in *De vulgari eloquentia*, Boccaccio paid him tribute by incorporating almost all of his canzone *La dolce vista e 'l belguardo soave* in *Filostrato* (5.62-65), and Petrarch lamented his death in the sonnet *Piangete, donne, et con vol pianga Amore*.

Cino Rinuccini

Cino di Francesco Rinuccini (1350-c. 1417) was a Florentine poet, polemicist, and wealthy merchant. He was a member of the wool traders' guild (Arte della Lana) in 1381, and like many other intellectuals of his time he also belonged to the guild of doctors and pharmacists (Arte dei Medici e Speziali). He was active in Florentine politics and held some minor posts, serving on the council of the commune (1411) and the council of the people (1414).

Cino's collected poetry consists of fifty-two poems dealing primarily with the theme of love. His *rime* have come down to us in nine codices and were included in the prestigious *Raccolta Aragonesa*, a poetic anthology commissioned by Lorenzo de' Medici as a gift for Pietro d'Aragona in 1476. Unlike his political and cultural pamphlets, his poetry received little critical attention after several nineteenth-century literary historians, including Carducci, classified him as an epigone of Petrarch. However, Li Gotti (1947) commented favorably on the formal polish, elegant imagery, and musicality of Cino's verse, although he also noted that at times Cino's stylistic elegance borders on preciousness and that his musical sensibility tends toward technical virtuosity. In his anthology, Corsi (1969, 557) described Cino as "the last and most suggestive follower of the forms of lyric poetry from the *stilnovo* to Petrarch."

Cino's critics have underestimated the importance of *imitatio* as an aesthetic ideal of his poetry. By imitating the style and imagery of early

Italian poets, Cino pays homage to them and—more significantly—demonstrates the importance of poetry by representing its limits as a medium of human expression. In the sonnet *Chi è costei, Amor, che quando appare*, the poet claims that, were he aided by Homer, Virgil, and Dante, he would still be unable to describe his lover's beauty. Cino reinforces his representation of this theme by evoking Cavalcanti's sonnet *Chi è questa che vèn ch'ogn'om la mira*. Whereas for the *stilnovisti* artistic impotence is usually a rhetorical pretext, for Cino it is a prominent theme. In the conclusion to the *canzone* *Tu vuoi ch'io parli, Amor, de la bellezza*, Cino underscores his pessimism with a self-conscious statement about his artistic incapacity: *Deseritto hai, canzon mia, piccola parte! di quel che ho dentro, ch'io non so mostrare* (verses 91–92, "You have described, my song, a small part of what I have within, that which I am unable to show").

Cino Rinuccini is known to scholars of the *Quattrocento* primarily for two invectives: *Risponsiva alia Invettiva di rnesser Antonio Lusco* and *Invettiva contro a certi calunniatori di Dante e di messer Francesco Petrarca e di messer Giovanni Boccaci*. . . . These were composed in Latin and probably translated into Italian by Giovanni Gherardi da Prato, the author of the novel *Il paradiso degli Alberti* (1426).

The first invective, *Risponsiva*, is a response to an antiFlorentine diatribe of Antonio Loschi, who was secretary to the duke of Milan, Gian Galeazzo Visconti. Loschi's invective was written in the spring of 1397, at the beginning of the war between Milan and Florence. Historians have debated the dating of Cino's *Risponsiva*: Hans Baron believed that Cino composed his pamphlet shortly after reading Loschi's piece; Witt (1970) gave a later date, 1406-1414; Tanturli (1976) offered evidence that Rinuccini's pamphlet was composed after 1401 but before 1406. In any case, *Risponsiva* reflects Cino's ardent republicanism and his defense of the Roman origins of Florence. His main point is that democracy is a more efficient form of government than monarchy, because "more eyes see better; more minds understand more; and the majority is more effective than one person" (Lanza 1991, 192).

The second invective, *Invettiva*, was aimed at the humanist critics of vernacular literature, in particular, Niccolo Niccoli. Cino—along with his fellow poets Domenico da Prato, Giovanni Gherardi, and Francesco Landini, who frequented Antonio Alberti's villa in the Florentine

countryside—took a traditionalist position in the cultural battle against the new class of intellectuals who claimed that Latin was superior to Italian. In *Invettiva*, he argues against the disinterested scholarship of the humanists and promotes the notion of culture as a social good. He complains, for example, that humanist philologists are misguided because they are not concerned with the truthful lessons of history which are useful to the republic (Lanza 1971, 263). Lanza, however, holds that the traditionalists saw only the errors of the humanists' critique of late medieval culture and were blind to their innovations (1971, 100).

Whatever Cino's own shortcomings, his poetry and invectives reveal that he was a prominent intellectual who defended Florentine culture and democracy in a critical period of the republic's history.

Ciompi

The term *ciompi* was used in the latter half of the fourteenth century for Tuscan, especially Florentine, members of the lowest working classes, particularly those in jobs related to the wool cloth industry. These were able-bodied people who received only low and uncertain wages, often as day laborers. They did both skilled and unskilled tasks, such as wool carding, spinning, and weaving, for masters in the various crafts that were represented in the city's guilds. They themselves were not organized into guilds, and they were politically disenfranchised; their only power came from other kinds of self-organization and from mob action.

In the early 1340s, the duke of Athens (Walter of Brienne), then the ruler of Florence, did allow these *sottoposti*, or laborers, to organize a guild—a radical concession that was very short-lived. It was at that point that the term *ciompi* was first heard, probably as a local variant of the French *compères* (companions), used by members of the duke's retinue. In 1345, a Florentine wool carder (or perhaps a skinner), Ciuto Brandini, attempted to organize others in his class, but he was executed for his efforts. His sentence described him as "hated by all for his condition, activities, and bad reputation."

In Siena, similarly, Donato di Neri described the local *ciompi* as "the most contemptible of plebs" who wanted to "slay the masters of the city." In late 1370, food prices had risen steeply; and in 1371, 300 workingmen formed the Compagnia del Bruco and marched on the city hall. This attempt, like others in Lucca (1369) and Perugia (1370, 1371, 1375), soon failed. The most famous and successful of the *ciompi* revolts was that in Florence in 1378.

In Florence, as elsewhere, the black death and recurrent outbreaks of plague caused labor shortages, so that conditions and salaries for industrial and other workers improved over the second half of the fourteenth century. Nonetheless, several factors led to discontent and rebellion among the *ciompi* of Florence. A war with the papacy (1375—summer 1378) had hurt the Florentine economy and had led to enormous public expenditures (an additional 2.5 million florins), public debt, and increased taxation. In the wool industry, recent tension and rivalry had resulted in lower overall production, tighter restrictions on the workers, and higher unemployment. In addition, in mid-June 1378, powerful aristocrats of the Guelf party (*parte guelfa*) who opposed the papal war were plotting to overthrow the popular regime, which was led by the guilds. On 18 June, spurred on by Salvestro de' Medici, the "standard-bearer of justice" (*gonfaloniere della giustizia*), members of the lower classes—or *popolo minuto*—including the *ciompi*, rallied to the government, plundered the houses of the Guelf leaders, and drove these Guelfs into exile. The forces of the oligarchy had been checked, and those of democracy had been unleashed. In response to the threat of conspiracy and the reality of violence, many shops closed and their owners fled; as a result, food shortages threatened the city. On 22 June, rioters burned a dozen *palazzi*, but several executions temporarily restored order.

As conditions worsened, the minor guildsmen and the *ciompi* began to rethink the structure of Florentine government. On 9 July, the guilds successfully petitioned the government to apportion political and electoral power equally among the twenty-one guilds. This altered the older system, in which the seven more important guilds, or *arti maggiori* (merchants, bankers, industrialists, and professionals), had held a greater share than the fourteen *arti minori*, or lesser guilds (artisans and shopkeepers). Soon it became clear that this move opened

the door for the *ciompi* as well, since if they could organize into one or more viable guilds, they could share power with their employers, the masters of the established guilds. A group of laborers met on 18 July at Ronco, near Florence, to draw up a petition for, among other things, a guild, a role in the government, and a 50 percent increase in their salaries. They presented this petition to the government on 21 July. On the previous day, 20 July, members of the *arti minori* had been denied a greater number of seats in the city's principal offices, so they were well-disposed to an alliance with the *popolo minuto* who were seeking power. This alliance, along with a huge popular demonstration in the Piazza Signoria, rioting, arson, and the ouster of the sitting government, ensured the petitioners' success. By 23 July the movement had become a revolution and had succeeded. In consequence, supreme authority was vested, until 31 August, in a special commission (*balia*) that included 130 members from all classes except the magnates, and three new guilds: the *tintori* (cloth dyers), the *farsettai* (shirtmakers), and the *popolo minuto*, the largest of the three.

The banner of state had been abandoned by the standard-bearer of justice (now Luigi Guicciardini) and recovered by the wool carder Michele di Lando, who was granted this important executive office until the end of August. On 4 August, the Florentine civic offices were divided equally among the three groups of guilds: the *maggiori*, the *minori*, and the three new guilds. The program of the *ciompi* was furthered by several new developments: major offices were subjected to a new scrutiny in order to expand the basis of participation; debt repayment was suspended for two years; interest payments on communal bonds were suspended; a direct property tax (*estimo*) was reinstated; several *ciompi* were knighted; and (perhaps) a floor of 24,000 cloths per year was set for Florentine cloth production. Yet many workshops remained closed and wages unpaid; and a trend toward conservatism led to the repudiation of most of the radical legislation.

This impelled the more radical *ciompi* to make greater demands at the end of August, when Michele di Lando's and the commission's terms were to expire. In a mass meeting held in the Piazza di Santa Maria Novella, eight "saints" were elected to represent the *ciompi* to the government, and to demand a permanent place in it. But guildsmen led by Lando violently attacked the demonstrating *ciompi* on 31 August,

and the movement collapsed. The new government of September 1378 quickly abolished the guild of the *popolo minuto*, and a reaction set in. Leaders fled or were arrested and executed or exiled. Although many of the leaders who had fled or been exiled joined the disaffected Guelf exiles in Siena and Bologna, where they plotted revenge and supported minor uprisings, the revolution was over—and it had failed. In January 1381 or 1382, the charters of the guilds of tinters and shirtmakers were revoked, and the oligarchy formally reasserted itself.

Until the success of the French Revolution, historians deplored this popular outbreak, but nineteenth-century liberals found it stirring. Modern scholars attempting to characterize the *ciompi* revolt and assess its significance have generally fallen into two camps. Some, like Rodolico (1971), Rutenburg (1971), and Cohn (1980), utilize a Marxist framework and stress a class struggle—early proletarians against the forces of early capitalism—and the radical nature of the movement. They argue that had the economic elements of this program succeeded, the relationship between Florentine masters and workers would have changed fundamentally. Cohn points out that the *ciompi* program would have moved the government "from representing less than 20 percent of the population to almost all of the adult male population."

On the other hand, Brucker (1968, 1972, 1977), De Roover (1968), and Najemy (1982) have stressed the workers' attempts to join the ranks of the guildsmen and thus to share power in the Florentine state; these scholars see the *ciompi* program as conservative, Brucker describes the "*ciompi* government" of 22 June-31 August as, in reality, "an enlarged guild community" that demonstrated a "*petit bourgeois* mentality." According to De Roover, the demands of the *ciompi* "were by no means as radical or as revolutionary as one might suppose." Najemy does consider the *ciompi* revolutionary, especially in the context of the fourteenth-century commune, but notes that they followed the lead of the minor guilds and remained "within the historic framework of Florentine corporatism."

Civitavecchia

Civitavecchia, the ancient Centumcellae or Centum Cellae, has Etruscan foundations; but the true beginning of Civitavecchia dates from C. A.D. 106, when the emperor Trajan had an artificial port constructed there (this is recounted by Pliny the Younger, 6.31). The port served as an important base for the Roman fleet and remained important until the sixth century, when it was contested by the Ostrogoths and Byzantines. It was destroyed by the Saracens in 828. In 854, Pope Leo IV gathered the scattered population into a new city,

briefly named Leopolis. However, the inhabitants preferred the name Cencelle, and in any case they subsequently returned to the former site, which was then called *Civitas Vetula*—"old city"—and eventually *Civitavecchia*.

The city was impoverished and weak, subject to the endless assertions of control by neighboring monks, the Roman commune, barons in the countryside, neighboring towns, and the popes. When the papacy was moved to Avignon, the city entered a period of internal strife that was further complicated by the Great Schism. The port returned to the control of the papacy in 1431, after a formidable siege. Thereafter, it became part of the papal states.

Clare, Saint

Clare (in Italian, Chiara; 1193 or 1194–1253) was among the earliest followers of Saint Francis, and founder with him of the second order of Franciscans, better known as the Poor Clares. Clare renounced her worldly possessions to follow Francis c. 1212. Before long, she was joined by a number of other women devoted to Franciscan ideals, and c. 1215 Francis himself named her the abbess of a new foundation for women at San Damiano, near Assisi. The second order grew from this community, of which Clare remained head until her death; its first rule was granted in 1219 by Cardinal Ugolino (later Pope Gregory IX). Thereafter, numerous daughter houses were founded in Italy and

eventually throughout Europe. The austerity of the Poor Clares went far beyond anything previously practiced by religious women, especially after modifications in the rule granted by Pope Innocent IV in 1247 and 1253. After Clare's death, a milder rule was granted by Pope Urban IV in 1263 and was adopted by the majority of the houses. Clare's own foundation at San Damiano, however, had insisted, from its earliest days and at her personal urging, on the strict observance of the *privilegium paupertatis* or privilege of poverty, as originally granted, and it never accepted any relaxation of the rule. Clare was canonized in 1255.

Various writings attributed to Clare survive in the corpus of material associated with the early development of the Franciscan order. At least four letters are generally accepted as genuine; another letter and two devotional texts known as the *Testament* and the *Blessing* are disputed. A contemporary biography of Clare, attributed to Thomas of Celano, Francis's first biographer, is preserved in *Acta sanctorum*.

Clare of Montefalco, Saint

Clare (1268-1308) was born at Montefalco, near Perugia, into a wealthy family that was already distinguished for its dedication to the church. Her brother, Francesco, and her sister, Giovanna, both embraced the religious life, and Clare herself began to show signs of unusual piety from a very early age. Clare was only six years old when she followed her sister into the community of San Leonardo, which Giovanna had founded. Here Clare led a life of extreme asceticism and devotion for some fifteen years, until she and her fellow religious moved, under Giovanna's leadership, to new quarters, which they called Santa Croce. In 1290 the bishop of Spoleto, responding to a request from Giovanna, authorized the community to adopt a version of the Augustinian rule. It is not clear that Santa Croce ever formally adhered to the Augustinian order; its beliefs and practices appear to have been influenced primarily by the Franciscans, who were hugely influential in Umbria during the thirteenth and fourteenth centuries. (However, controversy on this point continued long after Clare's death; both orders were by then anxious to claim her, though neither, significantly enough, officially sponsored her for canonization.)

Giovanna died in 1291, and Clare succeeded her as abbess of the community of Santa Croce. For the rest of her life, Clare was a figure of unusual celebrity and authority in the religious life of Umbria. She acquired a reputation as a healer, a counselor, and a visionary, and she was visited by many leading ecclesiastics, with whom she engaged in spiritual and theological discussions. Interestingly, despite her lack of

formal education (although she could read Latin, at least for liturgical purposes, and taught others to do so), she was widely respected as an authority on the interpretation of scripture and the exposition of doctrine: in this capacity she was centrally involved in the denunciation of the heretical Franciscan Bentivenga da Gubbio after her meeting with him in 1306. At about the same time she drew on her considerable local influence to help bring about a truce between the rival communes of Trevi and Montefalco.

Although the campaign for her canonization began shortly after her death (propelled by her first biographer, Berengar of Sant' Africano) and met with some initial encouragement, it was delayed by the reluctance of Pope John XXII to endorse Clare's particular kind of visionary mysticism, which was probably too close for his tastes to that of the Spiritual Franciscans. Thereafter the cause became bogged down for many years in rivalry between the Augustinians and Franciscans. Not until 1624 was Clare beatified, and her canonization was decreed much later, by Leo XIII in 1881.

Claudius of Turin

Claudius (d. 827) was bishop of Turin from 817 or 818 until his death. He was strongly against the use of images in Christianity and took an active role in the Iconoclast movement

Claudius was probably born in Spain, near Sao de Urgel. In his youth he received an education in Spain among the clerics of Felix, who was the bishop of Urgel and was one of the most prominent figures in the Adoptionist heresy. Claudius moved to Lyon at the end of the eighth century and lived at the court of Louis the Pious, where he was ordained a priest. In Lyon, he studied with Leidradus. When Louis the Pious became emperor, Claudius moved with him to the imperial court in Aachen.

Claudius taught in Lyon and Aachen. He wrote biblical commentaries to numerous books and, in his writing, vehemently attacked the cult of images. He contributed substantially to the development of a type of commentary called *catenae*, which became very popular in Carolingian and later medieval times. The extant commentaries attributed to Claudius are those on Genesis, Exodus, Leviticus, Numbers, Joshua, Judges, Ruth, Kings, Matthew, Romans, 1 and 2 Corinthians, Galatians, Ephesians, and Philippians.

Clement IV, Pope

Clement IV (Guido Fulcodi, Gui Foulquois, Guy le Gros Foulques; c. 1200-1268, r. 1265-1268) had been cardinal bishop of Sabina (1262) before becoming pope. He continued the policy of Urban IV with regard to replacing Manfred of Hohenstaufen as king of Sicily by Charles of Anjou, and he raised money for Charles by mortgaging Roman churches and pledging church treasure. However, Clement did try—though unsuccessfully—to prevent Charles from forming alliances with Lombard towns, notably Mantua and Ferrara, and thus increasing his power north as well as south of the papal state. When Charles reached Rome, en route to Sicily, Clement sanctioned his coronation but did not attend it.

When Clement became pope, Charles was senator of Rome. Clement confirmed this title, but neither Charles nor his successor, who was appointed when Charles resigned after the battle of Benevento, made much effort to facilitate the return of the pope, exiled since Urban IV had fled in 1267. Meanwhile, Clement demanded repayment of the sums he had raised; refused Charles's request for the prolongation of a clerical crusading tax (tenth) imposed on France and Provence to pay for his expedition; reproached Charles for being overly tolerant of the Saracens, Greeks, and Germans in his new kingdom; and viewed with some dismay Charles's reaffirmation of Angevin authority in Piedmont and his growing power in northern Italy.

In 1268, however, Conradin challenged Charles of Anjou for the throne of Sicily, whereupon Italian Ghibellines, notably in Tuscany, rallied. Clement called Charles in to strengthen the Guelfs in Tuscany and later made him papal vicar. However, Clement discouraged Charles from concentrating much on the north. Clement excommunicated Conradin but deplored his execution by Charles shortly after the battle of Tagliacozzo.

During his pontificate, Clement was almost exclusively occupied with Angevin affairs. He granted a crusading tax to Louis IX but otherwise did little about the crusade. In church matters, he took a firm (and unusual) stand against nepotism, but his only lasting contribution was the reservation to the papacy of provision to the benefices of all clerics who died while at the papal curia, a further step in the growing centralization of the church.

Clement V, Pope

Clement V (Bertrand de Got, c. 1260 or 1264-1314, r. 5 June 1305-20 April 1314) was the first of the Avignonese popes. He was born in Gascony to a noble family, studied the arts at Toulouse, and then studied law at Orleans and Bologna. Through family connections he rose rapidly in the church, holding several canonries before becoming vicar-general to his brother, the bishop of Lyon. After serving as a papal chaplain, he was made bishop of Comminges in 1295 and archbishop of Bordeaux in 1299.

When Benedict XI died in 1304, the college of cardinals was deadlocked for almost a year over a successor, primarily because they were divided over papal policy toward the French king Philip the Fair. They settled on Clement because he had good relations with Philip but had also been a favorite of Philip's enemy Boniface VIII and had braved the king's wrath to attend a council called by Boniface during his struggle with Philip.

Disturbances at Rome and in the papal states prevented Clement's coronation there, so he was crowned instead at Lyon, on 14 November 1305. He spent the rest of his pontificate in France, in what he considered temporary residences. During the first four years of his reign he moved frequently, never spending more than a year in one place, but after 1309 he favored Avignon, a city subject not to the French king but to the king of Naples, a papal vassal. His intended to stay in Avignon only briefly, but his successors were to remain there until 1376.

Within weeks of his coronation, Clement initiated policies which convinced some contemporaries that he was a creature of King Philip. He annulled Boniface VIII's bull *Clericis laicos*, which had been directed at Philip, and declared that Boniface's *Unam sanctam* had not claimed any new papal authority over France or its king. He confirmed Benedict XI's absolution of Philip and restored Philip's deposed allies Giacomo and Pietro Colonna to the cardinalate. Also, within a month of his election he made the first of a series of appointments to the college of cardinals that gave a clear advantage to the faction which favored the French. Of ten cardinals appointed in 1305, nine were French. In 1307, Clement ordered an investigation of the Templars, again at Philip's prompting. Philip seems to have had political motives for attacking the Templars; he coveted their wealth. Moreover, the evidence Philip

submitted to Clement of sexual misconduct and witchcraft by the Templars had been extracted under torture. Nevertheless, Clement carried the investigation forward for several years, uncomfortable with the evidence but unwilling to drop the matter. He referred the case to the Council of Vienne for review, then decided not to wait for its decision. Rendering no decision on the evidence, he simply suppressed the Templars, citing the good of the church, on 22 March 1312. He then turned their enormous wealth over to the Hospitallers and to other military orders fighting the Muslims in Iberia, much to King Philip's chagrin. Some see this move as an example of indecision; others consider it a clever resolution of a complicated and embarrassing crisis.

In his relations with the empire, Clement was more decisive. He backed the election of Henry VII in 1308 and Henry's coronation as emperor in 1312, although he had been pressured by King Philip to support Charles of Valois, Philip's brother. In 1313 Clement prevented a war between Henry and Robert of Naples, the leader of Clement's forces in Italy, by threatening Henry with excommunication. On Henry's death a few months later, Clement claimed authority to supervise the empire during the vacancy.

In Italy, Clement and his Guelf allies struggled, though desultorily, to regain control of the papal states. Throughout Clement's reign, Rome remained too unstable to be occupied safely. Clement also did his own cause considerable harm by appointing rapacious Gascon favorites to govern the Italian lands he did control.

Perhaps Clement's most important achievement was the Council of Vienne (1311-1312). It was originally called to consider the case of the Templars, but it accomplished much more, taking measures to ease the tension between the Spiritual and Conventual factions in the Franciscan order and to arbitrate disputes between secular and mendicant clergy. It also addressed the tension between papal delegates and bishops. The council's work was preserved in *Constitutiones Clementinae*, a collection of decretals redacted by Clement; this collection was promulgated by Clement's successor, John XXII, and became the seventh book of the *Decretales* in the church's *Corpus iuris canonici*. Clement also founded the universities of Perugia and Orleans and established the statutes of the medical faculty at Montpellier. At the urging of Ramon Llull, he commanded that chairs in Syriac, Arabic, and

Hebrew be established at Oxford, Paris, Salamanca, and Bologna, in order to aid mission work in Asia.

During much of his reign Clement was seriously ill, perhaps with stomach cancer. This may account for his seeming malleability and his lack of stamina in dealing with Philip the Fair. His illness also left him incapable of supervising the papal court for long periods; as a result, serious corruption developed. Clement had hopes of returning to Rome after the Council of Vienne, but his bad health prevented it. He died at Rocquemaure on a final journey to Gascony.

Clement VI, Pope

Pope Clement VI (Pierre Roger, c. 1291-1352, r. 1342-1352) succeeded Benedict XII. Unlike his thrifty predecessor, Clement was a bountiful patron and a lover of ceremony who preached effectively on major occasions. Clement expanded the papal palace in Avignon, seeking an increase in curial revenues to pay the expenses incurred. He was charitable, especially toward the victims of the black death of 1348; but he suppressed the bands of flagellants who converged on Avignon after the epidemic. Clement was inclined to seek military solutions to political problems. Although unable to organize a crusade, he did form a league against Turkish pirates. Since Lewis (Louis) of Bavaria had

fallen from power, the pope was able to make peace with the empire; but his goodwill did not extend to Charles IV of Luxembourg, who had ambitions in Italy. Clement waged war against the tyrants of Romagna and the March of Ancona, but, after initial success, his underpaid troops were defeated. Clement was more successful in diplomacy, temporarily reconciling the conflicting interests of Milan and Florence. He favored the tribune Cola di Rienzo's efforts to restore the greatness of Rome, until Cola launched his revolution in 1347. Clement welcomed Cola's overthrow in 1351. Clement's luxurious court drew criticism, even from Petrarch, who had benefited from the pope's generosity.

Cluny and the Cluniac Order

Cluny, a Benedictine monastery in Burgundy and motherhouse of the Cluniac order, was founded in 909 by Duke William the Pious of

Aquitaine. Cluny was one of several religious houses established at the turn of the tenth century to arrest or reverse a precipitous decline in religious life. The disintegration of the Carolingian empire had led to the destruction of many monasteries; lay control of the survivors had caused many to give up observance of the Benedictine rule. Duke William's charter exempted Cluny from secular authority, placing it under the protection of the Holy See. This device, which had already been applied at a number of other reformed monasteries, left the monks of Cluny free of lay interference.

Duke William chose as Cluny's first abbot, Berno of Baume, a reformer in the tradition of Benedict of Aniane. A century earlier, Benedict had sought to bring all Carolingian monasteries under a unified organizational structure that would regularize observance of the Benedictine rule and make communal prayer a more important part of the monks' daily routine. Berno vigorously pursued these ideals during his abbacy (909-926), and he was able to bring several other monasteries into uniformity with Cluny. His successor, Odo (926-944), broadened Cluny's influence, reforming monasteries in France and Italy, promoting lay piety, and aiding the emergent ecclesiastical peace movement.

Abbots Aymard (944-965), Mayeul (965-994), and Odilo (994-1049) continued these policies. As Cluny's fame increased, so did its land grants and the number of monasteries accepting annexation by Cluny. Meanwhile, Cluny was also founding many new monasteries. It treated all these houses as extensions of its own community, bound by a vow of obedience to the Cluniac abbot. During the abbacy of Hugh (1049-1109)—considered the high point of Cluny's history—it is estimated that more than 1,000 monasteries in France, Italy, Spain, and England professed allegiance to Cluny. Each monastery founded by Cluny was run by a prior appointed by the abbot of Cluny; and each followed the same calendar, canonical hours, and other observances as Cluny. All monks in these monasteries made their monastic professions before Cluny's abbot. Preexisting monasteries that were annexed to Cluny observed these rules more loosely, depending on the terms of their annexation. As Cluny grew, its abbots carefully cultivated the support of the papacy, obtaining from the popes timely affirmations and extensions of their original exemption. By the early eleventh century,

Cluny was immune from all episcopal and lay authority.

In the tenth and eleventh centuries, Cluny had a strong influence on ecclesiastical art, architecture, and music. It was also an important force in generating church reform. Although the monastery remained generally aloof from the political struggles of the Gregorian reformation, it produced some important figures in the reform movement. Pope Urban II is perhaps the most famous.

Cluny lost considerable prestige when it was racked by internal disputes during the early twelfth century. A weak and overextended system of central government seems to have been the cause. Peter the Venerable (1122-1156) restored some of Cluny's luster, but the monastery never again exercised the kind of moral authority it had during the mid-eleventh century. At the same time, the reforming ideal on which the Cluniac network was based came under attack by Cistercian reformers who propounded a purist interpretation of the Benedictine rule. Many of Cluny's practices, especially its liturgical traditions, were condemned as corruptions. Cluny weathered the attacks but lost its image as a leader of reform and a model of primitive monastic perfection. It entered a period of slow decline during which its dependents gradually slipped away. In the thirteenth century it came under the authority of the French monarchy.

Coins and Mints

Early Middle Ages

The coinage system of early medieval Italy, like that of the late Roman empire, was based on a gold coin, the *solidus*, and its fractions. Silver and copper issues were of varying weight and value and were produced sporadically. As introduced by Constantine the Great in the early fourth century, the *solidus* was a coin of pure gold, weighing 24 ancient *siliquae* or about 4.5 modern grams; its half was the *semis* and its third the *tremissis*. (Note: 1 gram = 0.035 ounce.) At the end of minting in the name of western emperors in the late fifth century, *solidi*, *semisses*, and *tremisses* of the same types (images) and standards were produced at four Italian mints: Milan, Aquileia, Ravenna, and Rome.

Little change was brought to the gold coinage under the Ostrogoths; Milan, Ravenna, and Rome continued to mint Ostrogothic coins bearing the name of the eastern emperor; Pavia replaced Ravenna after Ravenna fell to Justinian in 540. Coins of these mints vary little from official

issues of Byzantium except for minor differences in the legends (inscriptions) of the *solidi* and the retention of iconographic details after their alteration at the official mints. There were no regular Ostrogothic issues of *semisses*. *Tremisses* of the Ostrogothic mints can be distinguished from those of Constantinople only by their (generally better) style. After the completion of Justinian's reconquest in 552, Byzantine gold coins were produced in Italy at the existing mints of Rome and Ravenna, and new mints were opened in Sicily and Sardinia and at Naples. These Byzantine Italian mints continued to produce *solidi*, *semisses* (mainly in Sicily), and *tremisses* through the eighth century, but the gold content of their coins dropped dramatically toward the end of this period. Italian minting of Byzantine gold coins continued in the ninth century in Sicily alone.

The gold coinage of the Lombards was of two distinct series: northern royal issues and Beneventan ducal issues. In the north, only *tremisses* were minted; at first these were imitations of Byzantine issues, but by the end of the seventh century the names of Lombard kings were added. These coins can be separated by their reverse types into two geographical groups—Lombardy and Tuscany—and those of the second half of the eighth century bear the names of a dozen specific mints. They are distinguished from other *tremisses* of the period by their wide borders, which rise in a cuplike fashion from the struck part of the coin. In the south, the Lombard duchy of Benevento produced gold *solidi* as well as *tremisses* of Byzantine style and continued this production through the mid-ninth century, well after gold coinage had ceased at northern Lombard mints.

The silver coins of the late Roman and early medieval period are called *siliquae* and multiples and fractions thereof. Unlike their gold counterparts, Ostrogothic silver coins usually bore the full name of the king as well as that of the Byzantine emperor. After the reconquest, the Byzantine mints of Italy produced silver coins more regularly and more abundantly than the eastern mints of the empire. From the late seventh century on, the silver coins of the Roman mint bore a papal monogram as well as the imperial name. The late seventh century also saw the introduction of silver coinage in the name of northern Lombard kings, probably following earlier pseudo-imperial issues that are difficult to distinguish from Byzantine coins. The royal Lombard silver coinage

lasted only a few decades; by the 730s, the coinage of northern Italy appears to have comprised entirely gold *tremisses*,

The bronze denomination of the late Roman empire was the *nummus*; many thousands of *nummi* were equivalent to a single gold *solidus*. Bronze coins with numerals indicating numbers of *nummi* of value were issued in the Ostrogothic period; they bore the identification of the Roman senate as well as the name of the king. Forty-*nummi* coins called *folles* (as well as fractions thereof) were minted at ever-decreasing weights in the Byzantine mints of Italy through the eighth century. Bronze played no part in the coinages of the Lombard kingdom of northern Italy or in the duchy of Benevento.

Ninth through Twelfth Centuries

Two series of military incursions brought about dramatic changes to the coinage of Italy: the Frankish victories of the late eighth century brought the coinage of the north into line with that of western Europe, while the Arab conquests of the ninth century brought the south into the monetary system of the Islamic world. The coinage of Carolingian Europe was based entirely on a single denomination, the silver *denarius*

(in English, penny; in Italian, *denaro*). For accounting purposes, these coins were grouped into a *solidus* (English, shilling; Italian, *soldo*) of twelve *denarii* and a *libra* (English, pound; Italian: *lira*) of twenty *solidi* or 240 *denarii*. The Carolingian *solidus* and *libra* were merely counting terms, however; only silver *denarii* existed as real coins. These were thin disks of fine silver weighing around 1.5 grams; their types were usually simple monograms, crosses, or schematic temples. The standard coin of Muslim lands was the gold *dinar* of about 4.2 grams; under the Fatimid rulers of the tenth century its quarter, called in western sources a *tari*, was the common fraction. These coins were usually without images and bore a form of the Muslim declaration of faith. Though the alloy of Islamic gold coins was closely controlled, their weight was not, and they were invariably weighed in transactions.

Gold florin reverse showing the Florentine lily. Private collection of Richard Lansing.

The imposition of Frankish coinage on Italy was effected within a decade of Charlemagne's victories of 774. After a brief transitional period, the coinage of Carolingian Italy was restricted to the issue of imperial *denari* from the mints of Milan, Pavia, Lucca, and Treviso. Venice began issuing *denari* early in the ninth century bearing the types and imperial name of the coins of its Italian neighbors. For the next three centuries, Venice minted *denari* in the name of the western emperor, while its merchants used mainly Byzantine coins for

commerce. In Rome, the popes substituted the recognition of Charlemagne and his successors for that of the Byzantine emperor on their ninth-century silver coinage. The dukes of Benevento identified Charlemagne as overlord on their gold *solidi* and introduced a silver coinage based on the Frankish *denarius* during his reign.

In the period of the disputed rule of northern Italy from the mid-ninth century through the mid-tenth, *denari* were minted in the names of rival rulers; these seldom bear mint names and can be only tentatively assigned to Milan and Pavia. In the Ottoman period, Verona and Lucca joined Milan and Pavia as imperial mints; c. 1000 all four were producing *denari* bearing mint names but interchangeable in trade. In the course of the eleventh century, the *denari* of these four mints declined in weight and fineness of silver at varying rates; the *lire* based on them ceased to be equivalent, and it became necessary to specify in documents which coinage was to be used in payment.

In the course of the eleventh and twelfth centuries, coinage in the north spread beyond the four traditional mints. In the mid-twelfth century, Pisa replaced Lucca as the main supplier of coinage for Tuscany, and it was joined by Siena by the year 1200. By the end of the twelfth century, other mints opened in northern Italy, including Susa, Asti, Genoa, Piacenza, Cremona, Brescia, Mantua, and Bologna. In the late twelfth century, Venice began putting the name of its doge on its *denari* rather than that of the emperor. While many of the communes, bishops, and lay rulers that issued *denari* claimed imperial privilege for their minting, they set their standards individually, and the coinages were not interchangeable.

The coinages of central Italy ended shortly after the brief period of Carolingian rule. Benevento issued its last gold coins in the first half of the ninth century and ceased minting silver by the end of the century. The papal coinage of Rome lasted until the late tenth century but then ceased for 300 years. In the late twelfth century the Roman senate began the issue of *denari* copied after those of Provins in Champagne, a frequent trading partner of Italian merchants.

The last Byzantine mint in Italy, Syracuse, closed in the late ninth century, but coins of eastern Byzantine mints continued to circulate in southern Italy into the twelfth century. Minting by the Arabic rulers of

Sicily began in the tenth century and consisted mainly of gold *tori* weighing about 1 gram, supplemented by tiny coins of base silver alloy. Beginning in the eleventh century, Norman rulers in Sicily, Amalfi, and Salerno issued coins in the Islamic and Byzantine traditions. Their gold *tari* originally copied Islamic prototypes in appearance as well as standard, but they gradually introduced Christian inscriptions and crosses. They also issued large bronze coins of original design but of Byzantine style and weight.

Later Middle Ages

The coinage of Italy at the end of the twelfth century was in its basic components little changed from that of 300 years earlier: northern mints coined only silver *denari* of European appearance, and the south produced mainly gold and bronze denominations whose overall aspect was Islamic and Byzantine. The increased participation of northern Italy in the economy of the Mediterranean and the growing political ties between the south and the rest of Europe brought the two coinage zones closer together. By the end of the thirteenth century, mints throughout Italy produced coinages in fine silver, in gold, and in "billon" (an alloy of gold or silver with copper). Though these coinages were not interchangeable, they were all in the European tradition and could be easily related to one another.

The changes started in Norman Sicily. In 1140, Roger II altered the standards of the bronze coinage and introduced the *ducalis*, a large coin of half silver and half copper weighing about 2.7 grams. Though it was clearly derived from Byzantine models and was, like them, cup-shaped, the *ducalis* gave Sicily a silver-based coinage which could serve as a link to the coinages of the north. A smaller, baser *denaro* was introduced to the south during the reign of Henry VI, in the late twelfth century. By this time, the coinages of most northern mints had so declined in standard that their *denari* weighed less than 1 gram and were of billon—that is, less than half silver in alloy. Beginning shortly after the middle of the century, northern imperial mints issued new *denari* with somewhat higher silver contents, though none nearly as high as those of the Carolingian period. In 1190, the coinage of Pisa was

improved to bring it into line with new *denari* of Siena.

Around the year 1200, Venice introduced its *grosso*, a coin of almost pure silver weighing about 2.2 grams. This was the first fine silver coin in centuries to be used by most of Europe and the Mediterranean world. The Venetian *grosso* was modeled after the Sicilian *ducalis* (though it was flat rather than cup-shaped) and was minted primarily for trade with the east. Other Italian minters soon followed with their own *grossi* of fine silver: Genoa in the 1220s; Bergamo, Verona, Bologna, Ferrara, Siena, Pisa, Lucca, Florence, and Arezzo in the 1230s; Trent and Modena in the 1240s; Milan by 1250; the Roman senate in 1253; and Savoy before 1300. Charles of Anjou brought the heavy pure silver coin to the south with the silver *carlino* of 1278, which survived in Sicily under the name of *pierreale* through the end of the Middle Ages. In Naples it was replaced in 1302 by the heavier *gigliato*, which went on to serve as the model for later coinages from Provence to the Aegean. The specific standards of these coins varied and were often altered over time, but the *grosso* of fine silver weighing between 2 and 4 grams became established as the basis for medium-level monetary transactions throughout Italy.

The south also served as the bridge for bringing gold coinage to all of Italy. In 1231, Frederick II issued the gold *augustalis* from mints in Messina and Brindisi. The fineness of 21.5 carats (90 percent pure) attached it to the standards of Islamic gold, but its fixed weight of 5.25 grams distinguished it from the Islamic and Sicilian gold coins of variable weight and aligned it with European coins, whose controlled weight allowed them to be counted rather than weighed. With its obverse portrait bust and reverse eagle, it resembled ancient Roman coins more than any contemporary issues.

Though the specific standards and appearance of the *augustalis* were not copied, the minting of gold coins of fixed weight was initiated in northern Italy within a few years of Frederick's death. In 1252, both Florence and Genoa began the issue of coins of 24-carat (pure) gold, weighing about 3.5 grams. Though other communes joined in the minting of gold in the later thirteenth and early fourteenth centuries, the Florentine *florin* (which soon eclipsed the *genovino*) dominated the gold coinage of northern Italy. Its designation as the medium for the accounting of papal tithes helped to establish it as the monetary

standard for all of Christian Europe. At mints in Brindisi, Barletta, and Messina, Charles of Anjou at first followed the standards of the *augustalis* with his gold *reale*; however, in 1278, he issued a coin of the same value but of pure gold and lesser weight, the gold *carlino*. After the Sicilian Vespers, the standards of the *carlino* were followed in the gold *pierreale* of the Aragonese rulers of Sicily. In 1284 Venice began to issue its gold *ducat*, on the same standards as the *florin*, which quickly became the standard gold coin of the entire Mediterranean trade.

While these gold coins were being minted at the centers of international trade and silver *grossi* were issued from regional commercial centers, scores of communes and principalities continued issuing *denari*, including those minters of the more valuable coins. The *denari* of Italian mints were of different standards, except where coinage conventions imposed a limited and transitory consistency, and generally continued a progressive decline in fineness and weight. To supplement these increasingly copper *denari*, and often to distract attention from their debasement, various minters introduced multiples worth two, three, four, and six *denari* (still of the alloy billon) and *soldini* of twelve *denari* (of somewhat finer alloy).

By the end of the Middle Ages, all Italy used coinages of three basic types and levels of circulation: black money, white money, and gold coinage. The black money consisted of *denari* and their low multiples; it was minted locally and formed the basis for the *soldo* (twelve *denari*) and *lira* (240 *denari*) of the local systems of accounts of the north. In Sicily and the Regno the accounting system grouped 6 *denari* into a *grano*, twenty *gram* to the *tari* of account and thirty *tari* to the *uncia*. White money was the term for heavy coins (2 grams or more) of relatively fine silver produced at the major commercial centers. Though the issuers often sought to tie the value of their *grossi* to their *denari*, they were seldom successful, and the *grossi* were either accounted in the petty *lira* at current market rates or grouped into *soldi* and *lire* of *grossi* (twelve and 240 *grosso* coins respectively). Because the ratio of gold to silver was everchanging, gold coins could never be pegged to a local system of black or white money and were always accounted at a variable value in such systems or just counted, though usually in decimal terms rather than grouped into *soldi* or *lire*.

Cola Di Rienzo

Cola di Rienzo (1313-1354) was a notary who in 1347 seized power in Rome, proclaiming himself "tribune." Cola—the name is a dialect form of Niccolò or Nicolaus—was born in Rome. He was the son of a tavern keeper named Lorenzo (Rienzo) Gabrini and a laundress named Maddalena, although he later claimed to have been fathered by Emperor Henry VII. Cola was raised by a relative of his father's at Anagni. At age twenty he returned to Rome and married the daughter of someone called Cecco, possibly the notary Francesco Mancini. Cola received formal training as a notary and read the works of a number of ancient authors, including Virgil, Ovid, Lucan, Livy, Sallust, Cicero, Seneca, Valerius Maximus, Statius, Boethius, and Symmachus. He also trained himself to read ancient inscriptions.

Cola's public career began in December 1342, when a *popolano* government of "thirteen good men" took power in Rome and sent Cola to Avignon as its ambassador. Cola was to confer the title of senator on the new pope, Clement VI, and ask him to declare a jubilee in 1350. Cola was well received at the papal court, where he also became a friend of Petrarch's. In April 1344, he was awarded the office of notary of the Capitoline chamber. That summer, Cola returned to Rome. In a letter of 9 August 1344, Clement VI referred to him as a papal "familiar" and instructed the Roman senators to protect Cola from the Roman nobles.

Following his return, Cola began a remarkable campaign against the Roman barons, drawing on his historical knowledge and his keen sense of public ritual to rally the common people. He also made use of allegorical paintings (now lost) to convey his message. These included an allegory of Rome under baronial rule, an allegory of the revolution

he hoped to carry out, and a depiction of the Roman senate conferring the *imperium* on Emperor Vespasian. The last image was used to illustrate a notable speech Cola delivered in 1346, in Saint John Lateran, on the *lex regia de imperio*, the law by which the Roman people entrusted their *maiestas* (sovereignty) to the emperors. Cola had deciphered the text of this law on an ancient tablet—his reading is still used by epigraphers to fill in parts of the inscription that have since been lost—and he used it to justify popular sovereignty in the fight against the nobles.

On 20 May 1347, Cola carried out a successful coup, with the complicity of the papacy. Cola and the papal vicar were to rule together, each with the title "rector," and the pope confirmed this arrangement on 27 June 1347. But Cola also dusted off the republican title "tribune" for himself, and soon he was calling himself "Nicholas the Severe and Merciful; Tribune of Liberty, Peace, and Justice; Liberator of the Holy Roman Republic." On the afternoon of 31 July, in a public ceremony, Cola was immersed in a porphyry basin thought to have been used for the baptism of Constantine. On 1 August, Cola was proclaimed "Knight-Candidate of the Holy Spirit, Nicholas the Severe and Merciful, Liberator of the City, Zealot of Italy, Lover of the World, and Tribune Augustus."

Internally, Cola's policy was to restrain the barons and strengthen the hand of the *popolo*. He also undertook a number of significant external initiatives. Thus he declared the "unanimous will of the Roman people to take up their former rights of sovereignty"; extended Roman citizenship to all Italians; asked the cities of Umbria and Tuscany to send ambassadors to Rome; and announced a future "parliament" of communes. In practical terms, this may have seemed an attempt to revive the Guelf alliance of central Italian communes, but Cola's ambitions were obviously boundless. By mid-August the Avignon papacy changed its tune, probably encouraging a revolt by two Roman baronial families—the Colonna and the Orsini—at the end of September. On 20 November, the communal forces inflicted a major defeat on the barons, but this was followed by indecision on Cola's part, and as his position weakened, he resigned the tribunate on 15 December 1347.

After a flight to Naples, Cola returned in 1348 to Rome, where he was arrested by the Orsini. He was able to escape, however, amid the

anarchy that had been created by the black death. Between 1348 and 1350, Cola found refuge among the Spiritual Franciscans of the Abruzzi. Profoundly influenced by their eschatological message, he decided to go to Prague in 1350 to convince Emperor Charles IV that he was the instrument who would restore the kingdom of God on earth. (Probably at this time Cola wrote a commentary on Dante's *De monarchia*, dated between 1347 and 1352.) At Prague, Cola's message was received with suspicion, and at the pope's urging the emperor threw Cola into prison. On 24 February 1352, Clement VI transmitted a bull to the bishops of Germany excommunicating Cola, and that summer the prisoner was consigned for trial to the papacy at Avignon. Cola now denounced the prophecies of the Spiritual Franciscans, and he argued in his own defense that the religious policies of his tribunate in Rome had been entirely orthodox.

Cola was greatly aided by the death of Clement VI on 6 December 1352; in a remarkable reversal of fortune, the new pope, Innocent VI, freed him on 15 September 1353. Cola was quickly put to work in an effort directed by the papal legate, Cardinal Egidio Albornoz, to restore papal authority in central Italy. With some reluctance, Albornoz named Cola a Roman senator, and on 1 August 1354 Cola made a triumphal entrance at Rome, accompanied by 250 knights. Now acting strictly as the pope's agent, Cola again attempted to subdue the Roman barons.

The hostilities escalated, and this time Cola found it difficult to rouse popular support. A mob that had probably been moved to rebellion by two baronial families—the Savelli and the Colonna—killed him at the top of the Capitoline on 8 October 1354. His body was dragged through the streets, exposed for two days, and then burned.

Cola is the hero of several Romantic treatments of his story, including Wagner's opera *Rienzi*, and during the fascist period he was much praised. However, his influence on more immediate political and religious developments (the *ciompi* revolt in Florence, the Hussite movement in Bohemia, the Porcari conspiracy in Rome, and Savonarola's movement) has not been adequately explored.

Colombini, Giovanni

Giovanni Colombini (c. 1304-1367) was the founder of the Gesuati, a lay congregation devoted to preaching, penance, and service to the poor and sick. In 1355, Colombini, then a prominent merchant of Siena, had a religious experience that led him to divide his wealth with his wife, give his own share to charity, and dedicate his life to doing penance and serving the sick and the poor. He soon attracted a small band of followers; but he also aroused the hostility of some members of the Sienese nobility, who forced him into exile in 1360. For the next several years, Colombini and his followers wandered from city to city, visiting Arezzo, Città di Castello, Pisa, Lucca, and Florence. When a plague struck Siena in 1364, they returned to tend the sick and bury the dead. At about the same time, Colombini decided to organize his followers as a lay congregation following the rule of Saint Benedict. When the group was accused of teaching the errors of the Fraticelli (heretical Franciscans), Colombini sought the pope's approval to clear its name. Pope Urban V granted that approval a few weeks before Colombini's death.

Colombini was much admired by his contemporary Catherine of Siena and later by Philip Neri. His congregation gradually spread to many cities in Italy and France during the fourteenth and fifteenth centuries. Because of his followers' practice of calling aloud the name of Jesus, they came to be called Gesuati.

Colonna Family

The Roman Colonna family goes back, possibly, to the Tuscans, who at the beginning of the eleventh century ruled Rome from time to time and supplied no fewer than three popes. The first person known to have borne the family name was Pietro de Columpna, who is attested to at the beginning of the twelfth century; Pietro had taken the name from the family's castle near the city.

The descendants of Pietro de Columpna profited from conflicts between the papacy and the emperors. The first cardinal of the Colonna, Giovanni (d. 1245), sided with Frederick II Hohenstaufen, giving rise to the family's reputation—only partly justified—as Ghibellines, i.e., adherents of the imperial party. In the 1280s, the Colonna, through a deft change of party affiliation and an association with the papacy and with the Angevins of Naples, rose to become a leading family of Rome, whose standing would be matched only by the

Orsini. An essential element in this position was the placement of a member of the family in the College of Cardinals. In 1278, the pious Jacopo became the second Colonna cardinal; he was followed ten years later by his power-conscious nephew Pietro (d. 1326). Pietro's brothers, Stefano (d. 1348) and Sciarra (d. 1329), provoked a conflict with Pope Boniface VIII, who wanted to ensure the hegemony of his own family, the Caetani, in the areas south of Rome and in southern Tuscany (Campagna and Marittima) and was thus a threat to the power of the Colonna. In May 1297, the Colonna cardinals challenged the legality of the pope's election and appealed to a council. Boniface VIII consequently deposed the Colonna and called for a crusade against them and their relatives; in the course of that crusade, their fortresses—including their chief stronghold, Palestrina—were destroyed. After their defeat, some members of the family went into exile. Sciarra Colonna avenged his family in 1303, when, with the help of the French, he took Pope Boniface prisoner in Anagni. Boniface died shortly thereafter; and within a few years the Colonna, again thanks to the protection of the French king, succeeded in regaining their former positions in the College of Cardinals and—as senators—at the head of the Roman commune. In 1312 and 1328, they made it possible for Henry VII and Lewis (Louis, Ludwig) of Bavaria to receive the imperial crown in Rome. Stefano Colonna, however, in contrast to his brother, Sciarra, finally went over to the papal side and thereby gained a cardinal's hat for his son, Giovanni (d. 1348). Giovanni developed a splendid court in Avignon, where the curia had resided since 1309; the high level of culture at that court is reflected in the writings of Giovanni's *familiaris* and secretary, Francesco Petrarca.

As a result of the early deaths of Stefano Colonna's numerous children, and a conflict between the Roman tribune Cola di Rienzo and the Roman barons in 1347 and 1354, the Colonna lost a great deal of power in Rome. They regained considerable influence during the Great Schism in 1378 and the turmoil in the kingdom of Naples; now, they hired themselves out as *condottieri* and thereby compensated for their exemption from service in the city militia, which had been set in the city statutes in 1360. The position of the Colonna was further strengthened at the Council of Constance in 1417, when Oddone Colonna became Pope Martin V.

Como

Como (in Latin, Comum or Novocomum) is situated at the southern end of the western branch of Lake Como, in a valley enclosed by mountains to the east, south, and west. The city was founded in 196 B.C., became a Roman colony in 89 B.C., and received full Roman rights under Caesar in 49 B.C. It retains clear traces of the original Roman grid plan.

The first recorded bishop of Como was Felix, consecrated by Ambrose of Milan in the late fourth century. Como was conquered by the Huns in 452 and was occupied successively by the Ostrogoths, Byzantines, and Lombards. During the Lombard period Como was attached to the duchy of Milan. At the beginning of the seventh century, Bishop Agrippinus broke with Rome and Milan over Nestorianism and submitted to the archbishop of Aquileia.

Under the Carolingians, Como was part of the county of Milan, but

because of the city's position on the route linking Italy to the Frankish kingdom its bishops played an important role in imperial politics. As a result, the bishops acquired comital privileges and other rights that made them effective lords of the city. During the eleventh and twelfth centuries, the bishops undertook extensive building programs that reflected their power.

A commune composed mainly of local landowners existed in Como by 1109, when the sources first refer to magistrates called consuls. The new commune sought the support of the German emperors against the encroachments of neighboring Milan. A dispute with Milan over the appointment of the bishop led in 1118 to a war that ended in the capture and sack of the city by the Milanese in 1127. With imperial assistance the city recovered, and by siding with Frederick I Barbarossa it not only recovered its former territories but also obtained a share of Milanese lands in 1162. Como joined the first Lombard League of 1167, but quickly changed its allegiance at the approach of Frederick's armies. In 1176, Como again aligned itself with the victorious league, and Como was one of the communes whose independence was acknowledged in the peace of Constance (1183).

During the war against Frederick II, Como was split by a factional struggle between the Guelph Vittani family and the Ghibelline Rusca that lasted until 1335. The fortunes of these two parties mirrored those of the corresponding Milanese factions, the Delia Torre and Visconti, whose adherents controlled the positions of podesta or bishop in Como. The victory of the Guelfs in 1303 was reversed by an expedition undertaken by Emperor Henry VII, and with the return of the Visconti to power in

Milan, their Rusca allies regained control of Como. In 1335 Franchino Rusca offered the *signoria* of Como to Azzone Visconti, the *signore* of Milan. Except for a brief renewal of factionalism after the death of Gian Gaieazzo Visconti in 1402, Como remained under the control of the Visconti until 1451, when it passed to the Sforza lords of Milan.

Como's cathedral, Santa Maria Maggiore, dates from the first half of the eleventh century. After 1396, the nave was completely reconstructed in a late Gothic style, and the east end was finished during the Renaissance. The fifteenth-century facade includes statues of the two Plinys, who were natives of Como.

The basilica of the monastery of Sant' Abbondio, southwest of Como, is one of the best-preserved examples of Lombard Romanesque architecture. It was dedicated to a fifth-century bishop and patron saint of Como and was begun in 1022 and consecrated by Pope Urban II in 1095. With its austere facade, double towers, unvaulted nave, and minimal interior decoration, Sant' Abbondio resembles the imperial cathedral of Speyer in Germany, of about the same date. Germanic influences can also be seen in the polygonal apse of the twelfth-century church of San Fedele, which was inspired by Sankt Maria in Kapitol in Cologne.

Several monuments survive from Como's communal period. Three towers—Torre di San Vitale, Torre di Porta Vittoria, and Torre di Porta Nuova—line the southern wall of the largely intact twelfth-century defenses. The Broletto, north of the cathedral, served as the palace of the *podestà*. Built in 1215 in alternating courses of white, red, and gray marble, it is a particularly good example of Italian Gothic public architecture. The adjacent campanile, the Torre del Comune, dates from the same period.

Compagnetto Da Prato

The poet Compagnetto da Prato (c. thirteenth century) is virtually unknown, and the period of his activity remains elusive. Monaci (1955) considers Compagnetto an archaic poet, contemporaneous with Giacomo da Lentini, but more recent scholarship places him in the first generation of the Siculo-Toscani (Sicilian-Tuscan) poets. His geographical extraction supports this later dating (Prato is in Tuscany), and we have no proof that Compagnetto ever visited Sicily.

Compagnetto's poetic legacy consists of two poems, preserved in the Vatican codex (Vat. Lat. 3793). *Per lo marito c'ho rio* is a rare example in Sicilian of the genre *malmaritata*, which was cultivated with fervor in northern France. The female protagonist complains of her husband's cruelty and vows to take vengeance by accepting her lover's entreaties; meanwhile, an old woman, cast in the traditional role of *malparliera*, or speaker of evil, tries to obstruct this amorous relationship. This situation is essentially what one would expect to find in *fabliaux*, but not in courtly lyrics. *Per lo marito* is a *canzonetta* in dialogue form, as is the other poem attributed to Compagnetto, *L'amor fa una donna amare*, in which a lady begs her lover to give her his love.

Because of his popular themes and the easy-flowing style of his lyrics, Compagnetto has been described as a *giullare*, or jongleur.

Compagni, Dino

Dino Compagni (c. 1246-1324) was a Florentine merchant, political figure, and chronicler. He was born into a well-established Florentine family, embarked on a career in the cloth industry, was inscribed in the guild of Por Santa Maria (manufacturers of silk cloth and retail cloth dealers) in 1269, and served repeatedly as consul of his guild between 1282 and 1299. This was the period during which a government based on guilds and headed by priors and a standard-bearer of justice was established in Florence; and Compagni, as a prominent and respected member of a major guild, was deeply involved in these developments. In 1282, he was one of a group of six citizens that took the lead in establishing the guild regime; he himself served as one of the priors in 1289 and as standard-bearer of justice in 1293. When he was not himself in office, he served regularly in a consultative capacity, advising the officeholders as they tried to preserve peace and order in an increasingly turbulent political climate. Compagni was again one of the

priors in October 1301, when factional conflict between the Black and White Guelfs erupted into open warfare in the streets of Florence. Compagni and his fellow priors were forced to resign; the Black Guelfs seized and plundered the city; and many of the White Guelfs, including Dante Alighieri, were forced into exile. Compagni was spared that fate because of a law barring judicial proceedings against certain important officials for a year after they left office; nevertheless, the defeat of his party meant the end of his public career. He spent the rest of his life as if he were an exile in his own city, tending to his business and mulling over the events that had led to the defeat of the White Guelfs.

The fruit of Compagni's reflections was a chronicle that has ensured his fame ever since its rediscovery in the seventeenth century. In contrast to most medieval chronicles, which tend to be formless compilations of miscellaneous information, Compagni's is a tightly focused, dramatic account of the factional strife that tore at Florence between 1280 and 1312. Rather than a daily chronicle of events, Compagni produced a retrospective history. He wrote it between 1310, when an expedition of Emperor Henry VII to Italy aroused the hope that the White Guelfs would soon be restored to power in Florence, and 1313, when that hope was dashed by Henry's death. Freed from the obligation to record events as they occurred, Compagni was able to seek causes and connections. His detailed and exact information, incisive analysis of political motivations and alignments, and vivid portraits of such leading figures as Giano della Bella and Corso Donati—and the fact that this information comes from someone who was himself a participant in the events—make Compagni's chronicle an unsurpassed narrative source for the political life of Florence in the age of Dante.

Compiuta Donzella Di Firenze

The poet known as Compiuta Donzella di Firenze, or "accomplished young lady of Florence" (latter thirteenth century), is one of the first women known to have written poetry in Italian. Her identity and life remain unknown, however; Compiuta could be a real first name but is more probably a descriptive *senbal* (code name).

Three of Compiuta's sonnets survive, in one manuscript anthology. *A la stagion che 'l mondo foglia e flora* ("In the season when the world sends forth leaves and flowers") expresses anxiety about her father's choice of a husband for her, contrasting her misery with the joy of other lovers in the springtime. In *Lasciar voria lo mondo e Dio servire* ("I would like to leave the world to serve God"), she laments the general decline of noble behavior in the world and the increase of falsity and meanness, expresses her wish to enter a convent, and regrets her father's resistance. The vocabulary (*cortesia*, *villania*, *fin pregio*, *fin amanti*) reflects her familiarity with the Provencal verse much admired in her day. Like her contemporary La Nina Siciliana and her predecessors the *trobairitz*, whose works circulated in Italy, she participated in a *tenzone*—an exchange of sonnets—with an anonymous admirer, who says he would like to make her acquaintance. She responds to his interest with modest pleasure.

Master Torrigiano (perhaps the famous medical doctor, d. 1313) wrote two ambivalent sonnets about Compiuta, wondering whether to consider her unnatural, like a horse that can play a musical instrument, or miraculous, like a divine sybil. His second sonnet, perhaps an awkward apology for the first, claims that it is praiseworthy for her to have surpassed normal female nature. It is possibly also to her that Guittone d'Arezzo directed his fifth letter.

Condottieri

Condottieri were chiefs of mercenary armies operating in Italy during the fourteenth, fifteenth, and sixteenth centuries in the wars among Italian states. There are several elements in their background. Bands of adventurous soldiers came from outside Italy when periods of truce or peace had momentarily stopped the wars being fought in Europe. Moreover, imperial, and after 1265 Angevin, armies had crossed Italy and left a number of deserters ready to undertake any profitable enterprise. The political situation in Italy, which was divided into a number of independent states, some as small as a county, fostered

antagonism and conflicts that often led to wars. In the thirteenth century, such wars were fought by armies composed mainly of citizens — militias—with a limited number of mercenary soldiers who were enlisted individually or in small groups. In the fourteenth century, mercenary companies appeared, with a formal organization and a chief called a *condottiere* because his services were regulated by a contract, or *condotta*. Many factors favored the development of these companies. During a time of great commercial and industrial development, service in a militia became inconvenient for business-minded citizens. Also, the use of new arms, such as the longbow and crossbow, required technical ability and extensive training of professional soldiers. Furthermore, the increase of wealth—a result of the spectacular development of the economy of Italian cities—allowed for significant and consistent military expenses.

The first companies mentioned in the chronicles (1285— 1305), consisting of hundreds of soldiers, were those of William della Torre and of Diego de Rat, both from Catalonia. The company of Cerruglio (named after the small town where it had its base) gathered more than 800 German knights who had deserted the army of Lewis of Bavaria and elected as its chief the Italian Marco Visconti. The Cerruglio company conquered the city of Lucca, which it sold to Genoa for a huge sum.

Between 1320 and 1360, about 700 chiefs of German knights operated in Italy; their companies comprised some 10,000 men. According to some scholars, the first real company worthy of the name was San Giorgio (Saint George), led by Lodrisio Visconti; it consisted of 2,500 knights and 1,000 infantrymen, most of them from Switzerland. San Giorgio had two officers who later became famous *condottieri*: Conrad of Landau and Werner of Urslice. Werner formed the first company named Grande ("great"), together with another captain, Montreal d'Albarno, known as Fra Moriale. The Grande company won a remarkable battle against the feudal army of Naples at Meleto and amassed the incredibly large sum of 500,000 florins in spoils and ransoms. After the death of Fra Moriale, who was taken in Naples by Cola di Rienzo in 1354, Landau took the leadership of the Grande company until his death in 1363. Landau died in the battle of the bridge of Canturino, where he was defeated by another mercenary army, the

White company, called "of the Englishmen," led by the German Albert Sterz. John Hawkwood was also in that company; he was elected its captain general the following year. The White company soon became well known, not only for its shining armor but also for its strict code of discipline (its soldiers exercised a certain degree of moderation in pillaging) and its military ability, which was based on an impressive mobility and a capacity to move at night and in winter, using the tactics of the English armies under Edward III. The White company, the La Stella company of Albert Sterz, and the San Giorgio company of Ambrogio Visconti were the three most powerful mercenary armies in Italy in the mid-fourteenth century. When a company of Britons came to Italy under Bertrand de la Salle, they found a new company of Saint George led by an Italian *condottiere*, Alberico da Barbiano, who defeated them in 1379 in the battle of Marino.

At the end of the fourteenth century, a change took place in the relationship between the lords and states of Italy and the mercenary companies, and a new tendency developed: the most famous *condottieri* remained in permanent or semipermanent service. This was the case with Hawkwood, who served the republic of Florence; Jacopo Dal Verme and Alberico da Barbiano, who served Gian Galeazzo Visconti, the ruler of Milan; and Bartolomeo Colleoni and Gattamelata (Erasmus da Narni), who served the republic of Venice.

In the fifteenth century, most of the companies had Italian leaders. The most famous *condottieri* of that time were Andrea D'Oddo, Braccio da Montone, and Muzio Attendolo Sforza. They constituted a new generation of mercenary captains who combined military prowess with political ability and were ambitious to assume the leadership of existing states. The son of Muzio Attendolo, Francesco, became the duke of Milan, and Braccio ruled in Perugia.

Other *condottieri*, different from these, were prince-soldiers. They were rulers of small principalities, from which they drew their followers, and they fought other political entities for money and prestige. Examples include Carlo Malatesta of Rimini, his brother Pandolfo Malatesta of Fano, Facino Cane of Piedmont, and Ottobuono Terzi of Parma. Moreover, some Italian *condottieri* operated in foreign countries; for example, the Florentine Filippo Scolari became famous, under the name Pippo Spano, in Hungary.

In the sixteenth century, mercenary companies became less important, although the great armies of the French kings and the emperors were still composed of mercenary soldiers under contract—Italians, Swiss, Germans, and others.

Mercenary companies were in many respects peculiar to the history of Italy, even though they had been initiated by foreigners. They were an object of considerable criticism. Contemporary chroniclers and historians considered them an unfortunate result of the cynicism of their leaders, who were always ready to change patrons; these chroniclers also commented on the rapacious and disorderly behavior of the soldiers—who were sometimes more inclined to sacking and destruction than to fighting battles. Moreover, since the companies were composed primarily of knights, they contributed to the prolongation of military tactics based on cavalry charges, which were already at the point of becoming obsolete. On the other hand, some observers noted that certain companies, at least, contributed to a diffusion of new methods of warfare: such companies included the Englishmen, with their longbows; the dismounted knights; and the mounted archers. It should also be noted that, given their international composition, the mercenary companies probably contributed to habits of exchange that made the culture of the Renaissance truly European.

Confraternities

The first known Italian confraternities were founded in the early thirteenth century, although it is likely that some forms of confraternal life existed from the tenth century on as part of hospitals and hospices for pilgrims, among congregations, and in schools. Confraternities were formed voluntarily and spontaneously by groups of laypersons for mutual aid and devotional purposes, and they were one response to the anxiety generated when the spiritual life seemed to be challenged by a sudden rise, in the eleventh century, of an urban commercial culture; they also represented a response to more immediate political, economic, and social problems that necessitated mutual aid. Yet urbanization and commercialization cannot provide a thoroughly satisfactory explanation of the rise of confraternities, since even small towns had very active forms of confraternal life.

Although lay religious devotion was at the center of most of these organizations, their purposes and their social composition were often mixed. The earliest known confraternities—such as the Bigallo in Florence, which claimed to have been founded by Saint Peter Martyr—focused on the prevention and elimination of heresy through structured programs of religious devotion. At the heart of the confraternal impulse was penance: specifically, the satisfaction of penance through religious devotion and charitable works. Both devotion and works, however, were collective rather than individual; and confraternities, like most other corporate bodies in the Middle Ages, used the model of Active kinship to describe their members' relationship to one another. Although confraternities consisting entirely of men were the most common, there were also confraternities of women and of children. The children's confraternities, at least, were guided by one or more men.

Another important purpose of confraternities was to provide a network of social support for their members, beyond the guild and the family. Their activities and their charity were often limited to their own members. Confraternities attempted to preserve spiritual purity by requiring an aspiring member to be sponsored by a current member, undergo a waiting period, and even perform a specific penance or restitution for past sins.

Whereas the members of a guild were united by their occupation and families were united by lineage and alliances, confraternities were united by quite disparate religious purposes. *Laudesi* confraternities, for instance, were organized chiefly for public and private singing of lauds and performances of other divine offices. Quite often the *laudesi* companies were made up entirely of boys and became part of celebrations of official feast days. Companies of discipline, or flagellant confraternities, incorporated whipping as part of the penance imposed on their members, often followed by various charitable activities, such as distributing grain and alms to the poor or caring for the infirm and sick in hospitals. Certain confraternities specialized in accompanying condemned prisoners to execution and providing spiritual comfort to them by holding a devotional image before their eyes as they walked to the gallows.

Laudesi companies, which also performed charitable functions, are of special interest to historians of the performing arts. Many *laudesi* companies organized schools to teach singing as well as Christian doctrine. But singing was only one element of the festive life of *laudesi* confraternities, especially in the fourteenth and fifteenth centuries. Members of the *laudesi* confraternities carried devotional images, either painted or sculptured in wax, during processions; and the *laudesi* confraternities that specialized in spectacular dramatic performances often used mechanical devices and ingenious props for entertainment and edification. Confraternities hired musicians to play instruments as well, and very often all these elements were combined in spectacular religious plays and other dramatic performances. In the early modern period, confraternities led to the development of such advanced musical forms as the opera and the oratorio.

The wax devotional images mentioned above were significant. The proliferation of these images, at least in Florence, was a reliable

indicator of the popularity of a cult. The *laudesi* company of Or San Michele oversaw the manufacture and use of an enormous number of wax images, which were placed before a miracle-working Madonna there. In the fifteenth century, when popular devotion to the Annunciation increased, more than 600 images crowded the church of the Annunciation.

The sermons prepared for confraternities were as edifying as their dramatic performances. Most youth confraternities included training in rhetoric and "practice" sermons, both in Latin and in Italian, as part of the services provided for their members; more generally, adult and youth confraternities often sponsored public appearances by well-known itinerant preachers.

Disciplinary confraternities also encouraged their members to listen to sermons. However, the flagellant confraternities tended less toward the celebratory and more toward the penitential as a spiritual path. Such confraternities encouraged participation in religious rituals that focused not so much on the lives and miracles of individual saints as on the liturgical calendar, particularly during the period of Christ's passion and resurrection: Lent, Holy Week, and Easter. Devotional exercises encouraged members to meditate on these critical events in the life of the Christ; and in order to support such meditation the confraternities commissioned a great number of fresco cycles and other kinds of visual cues. One aspect of this meditative devotion was an elaborate visual language, which was crucial to the development of the visual arts in the late Middle Ages and would eventually provide the basis and techniques of Catholic reform in the *Spiritual Exercises* of Ignatius Loyola.

Indeed, quite apart from the benefits that confraternities conferred on their members, they provided a context for the hope of individual and collective salvation. Confraternities were the most obvious way of extending the benefits of the divine economy of salvation from the cloister to the street. One disciplinary confraternity in Florence, the Company of the Night, in imitation of the monastic schedule, woke its members to come to devotions in the very early hours of the morning. When scholars describe the piety of the late Middle Ages as more "individualized," they do their period of study a disservice, for it was precisely associations of laypersons, associations modeled on monastic

discipline, which held religious life together in the absence of strong ecclesiastical leadership and which would provide the structures that ecclesiastical leadership later utilized for reform and renewal.

The social composition of confraternities was an important factor in the way medieval Italians articulated religious impulses. The members of a confraternity might have been brought together simply by devotion to a particular cult, a particular saint, or even a particular image, and thus medieval confraternities were characterized by a remarkable social fluidity. In cities such as Venice, for example, the *scuole grandi* deliberately placed their rich and poor members in proximity so that the former could help the latter. In Florence, patricians and artisans performed their charitable work close to one another. In some confraternities, the members remained anonymous, primarily to conceal the identity of donors of charity but also to mask social differences. The members of the archconfraternity of the Misericordia in Florence, for instance, wore black robes and hoods. Some confraternities—such as those that helped the *poveri vergognosi*, the "shamefaced poor"—protected the anonymity of recipients of charity as well. The confraternities assisting the *poveri vergo-gnosi* reached out to those who were ashamed of their poverty for whatever reason, and that category could include nobles in reduced economic circumstances.

All these activities for the living were important both to members of the confraternity and to the larger public, for whom they became models of piety. However, much confraternal devotion centered on death and the memorialization of the dead. Members of a confraternity, like members of a modern burial society, could expect that their brothers would make the arrangements for an appropriate funeral and if necessary underwrite the expenses. Women from the families of the deceased mourned by singing lamentations, and as late as the twelfth century, they engaged in such public forms of mourning as tearing their hair and scratching their faces. By the thirteenth century, such behavior constituted a threat to public order in a highly factionalized society and became the object of much sumptuary legislation. Confraternities, however, were exempt from sumptuary legislation limiting funeral pomp. Lay confraternity members in good standing could be buried in religious habits; they could also attract very large crowd of mourners, especially in such cities as Venice, where an individual might belong to

more than one confraternity.

The increasing acceptance of the doctrine of Purgatory in the thirteenth century was an impetus for other kinds of commemoration of the dead. Prayer for the remission of sins in Purgatory was a monastic practice, and members of confraternities left bequests in their wills to pay for masses and other prayers to be said for their souls. Commemorative masses included specific offices for the dead and special sermons emphasizing the uncertainty and brevity of life. Further ceremonies, repeated once or twice a week, kept the memory of the deceased alive within the confraternity. All Saints' Day and certain other commemorative occasions also included feasting. Although feasting was traditionally an important part of confraternal life—perhaps as a survival of pre-Christian fraternal banqueting—the lavishness of confraternal banquets often prompted criticism of how confraternal officers spent resources.

Such concern regarding how finances were used became acute in the mid-fourteenth century, when the black death was already causing confraternities to focus more on charity and the commemoration of the dead. A succession of plagues throughout the century reduced the urban population of Italy by as much as one-half to two-thirds; and legacies to confraternities increased dramatically, partly as a result of this higher mortality but also in the hope that charity would placate the wrath of God. At the same time, though, there were fewer poor people to receive charity, since the plague killed the poor even more than the wealthy: the poor were less able to flee a plague-stricken city and also were malnourished and therefore less resistant to infection.

All this had mixed effects on confraternities. Certainly, the considerable misuse of funds for real estate speculation and building focused more communal scrutiny on the confraternities' activities and finances. At various times in the fifteenth century, some confraternities had to be licensed by municipal governments. But the large number of donations to confraternities involved them even more in patronage of the arts and in spectacular communal celebrations. Moreover, as municipal governments became increasingly involved in large charitable and architectural projects, Italian urban society and politics came to combine the secular and the sacred to a greater degree than had been the case earlier in the Middle Ages.

The importance of medieval confraternities in shaping the early modern world went far beyond establishing collective patterns of lay devotion. With regard to culture, they were a setting in which polyphonic music, drama, and theater were developed and practiced. They also provided a setting, and often funding, for major and sometimes innovative developments in the visual arts. Techniques of visualization that sustained individual religiosity were learned in confraternal settings. Members of some confraternities sharpened their rhetorical and philological skills in the confraternal oratory or parish cellar. By fostering an interpenetration of the sacred and the secular, and by providing future religious reformers with structures that balanced individual piety and collective ritual, confraternities assisted the spread of monastic discipline from the cloister to society at large. But ultimately, the importance of the confraternity must be measured by what it accomplished in the eyes of the individual members. It provided a ritual setting and a ritual community that stood in stark contrast to a society often perceived as divided and factionalized. Members of confraternities assisted each other, above all, in preparing for death and in preparing the soul for its ascent through Purgatory toward its true, final home.

Conrad II

Conrad II (c. 990-1038 or 1039) was the founder of the Salian, or Franconian, dynasty in Germany and Holy Roman emperor (r. 1024-1039). Henry II, the previous emperor, had died without an heir, and Conrad could claim a tenuous link with the Saxon dynasty through his mother. Conrad traveled to Italy only twice during his reign, but did consider Italy an important part of the empire.

Conrad undertook his first journey to Italy, in 1026-1027, because revolts had erupted after Henry's death and he wanted to restore order; he also wanted to be crowned there. He arrived in the spring of 1026 and was greeted by the high clergymen of Lombardy who had remained loyal during the rebellion. Conrad was crowned king of Italy in Milan and then quelled armed disturbances at Pavia and Ravenna. He was next crowned as Holy Roman emperor on Easter Day of 1027, in Rome.

His second and last expedition to Italy took place in 1036-1038. Violence had broken out in Milan between the lesser knights (the *valvassors*) and the great lords (the *capitanei*), who were supported by Archbishop Aribert of Milan. Both sides appealed to Conrad to adjudicate this dispute, so in December 1026 he set out for Milan. A synod in Pavia was to settle the matter, but Aribert rejected Conrad's imperial prerogative to judge the archbishop. Milan, led by Aribert, was in revolt by May 1037, and Conrad never did subdue either the rebellious archbishop or the city, even though he had the help of Pope Benedict IX. Conrad did, however, regulate the relationship between the *valvassors* and the *capitanei* in the *constitutio de feudis* (28 May

1037), under which the *valvassors* were to be secure from arbitrary seizure of their lands, their fiefs were to be inheritable, and they were allowed to appeal to the emperor's representative in disputed cases. In 1038, Conrad addressed some of the affairs of southern Italy before returning to Germany, where he died.

Conrad IV

Conrad IV (1228-1254, r. 1250-1254) was the last of the Hohenstaufen emperors. He succeeded his father, Frederick II, in December 1250. In

1237, in Vienna, Conrad had been elected king of the Romans by the German princes; since then, he had been Frederick's representative in Germany. After the deposition of Frederick II in 1245 at the Council of Lyon, Conrad fought two successive anti-kings in Germany: Henry Raspe (d. 1247) and William of Holland (d. 1256), who had the pope's support. This struggle was desultory and gradually became a stalemate.

When news of Frederick's death reached Germany, Conrad resolved to go to his newly inherited kingdom of Sicily—the Regno—where the Hohenstaufen held a stronger position than in Germany. Conrad settled his German affairs at a diet held at Augsburg in June 1251 and set out for Italy in October 1251. On his arrival, he was greeted by his primary supporters in northern Italy, Ezzelino da Romano, Uberto Pallavicini, and Manfred Lancia. Another diet was held at Goito, this time to arrange Lombard affairs; it was attended by delegates from a number of northern Italian cities.

Conrad next sailed down the Adriatic coast and landed in the Regno at Siponto on 8 January 1252. There he was greeted by his half-brother and regent in Sicily, Manfred; and still another diet was held—this one in Foggia, to settle Sicilian affairs. Before Conrad's arrival, there had been two major events in the Regno in 1251. First, revolts had begun against Hohenstaufen rule, although they were for the most part suppressed by Manfred. Second, Manfred had entered into negotiations with Pope Innocent IV, with the possible goal of having Manfred himself replace Conrad as king of Sicily; nothing came of this, however, because Manfred did not like the pope's stipulations. At Foggia, Manfred submitted to Conrad and was punished. The diet at Foggia also decided to open negotiations with Innocent IV so that Conrad would be recognized as emperor, and to finish putting down the Sicilian rebellions. Conrad's negotiations with the papacy in the summer of 1252 were a dismal failure: Innocent refused absolutely to consider a Hohenstaufen as emperor and king of Sicily at the same time. On the other hand, the revolts in the Regno were quelled, and by the end of 1252 only Naples still held out. During 1253, Conrad was occupied with invading Naples, which finally fell on 10 October after a siege of several months; the Regno was, therefore, pacified at last.

Once again Conrad opened discussions with the papacy. These lasted from October to February 1254, but, as before, no agreement could be

reached with Innocent, who would still not recognize Conrad as the legitimate emperor. Moreover, the pope directed against Conrad charges that were reminiscent of those made against Frederick II. Although Conrad denied these charges, they resulted in his excommunication in April 1254. Conrad then prepared to intervene in Lombardy with the Sicilian army and renew the conflict between the papacy and the empire there. However, while the army was gathering, Conrad died after an illness on 21 May, at Lavello.

Conradin

Conradin (1251 or 1252—1268) was, properly, Conrad, but he was called by the diminutive from the time when, at age two, he succeeded his father, Conrad IV, son and heir of Emperor Frederick II, as titular duke of Swabia, king of Jerusalem, and king of Sicily. He is sometimes known as Conrad V.

Conradin acquired the duchy on the death of William of Holland, king of the Romans, in 1264, and the government of Jerusalem was carried on in his name until his death. However, he never made good his claim to Sicily, where Frederick II's bastard son, Manfred, ruled, first in Conradin's name and, from 1258 on, as king. When Manfred was killed at Benevento in 1266, and Charles of Anjou seized the Regno, Conradin put forward his own claim. Soon afterward, Sicily was seized by two of his allies: Federico Capece and Prince Frederick of Castile (who was annoyed because Charles of Anjou had failed to repay a loan he had made toward the cost of the Angevin invasion). Conradin, underestimating the strength of Charles's position on the mainland, organized an expedition, backed principally by his uncle Lewis (Louis, Ludwig) of Bavaria, to take his southern inheritance. Pope Clement IV excommunicated Conradin but did not organize an adequate resistance: a Gueif army in Tuscany failed to stop him. In July 1268, Conradin reached Rome, which Clement had abandoned for Viterbo. In Rome, Henry, the brother of Frederick of Castile, had become senator following a popular insurrection directed largely against Charles of Anjou, who had resigned from the senate in 1266 under pressure from the papacy. Henry, after some indecision, became active on Conradin's behalf in 1267. He and Rome now welcomed the boy with wild

rejoicing. A month later Henry and Conradin marched south to the borders of the Regno, where they encountered the troops of Charles of Anjou near Tagliacozzo and were soundly defeated. Conradin fled to Rome, but Henry's deputy, Guido of Montefeltro, barred the city against him. He therefore headed for Terracina, hoping to escape by sea, but he was captured and handed over to Charles of Anjou in Naples. After a trial, in which he was found guilty of having tried to seize the Regno from Charles, the rightfully constituted king and vassal of the pope, Conradin was executed in October 1268.

The execution of the last legitimate Hohenstaufen shocked Europe: executing a sixteen-year-old was not unprecedented, but it was regarded as peculiarly merciless; and executing a reigning monarch (Conradin's position as king of Jerusalem had not been in doubt) and eminent prince was considered outrageous, even by Charles's allies. Nevertheless, Conradin's death removed the last threat to Charles from Germany and made him much more secure. It also removed one potential source of trouble in Germany, where Conradin would inevitably have become involved in the struggle for the kingship of the Romans.

Constance

Constance of Sicily (1154-1198) was the posthumous daughter of Roger

II Hauteville and his third wife, Beatrice of Rethel. She was probably born in Palermo, where she died.

Constance lived in obscurity until her betrothal to Henry VI, the son of Frederick I Barbarossa, on 29 October 1184. Their marriage in Milan on 27 January 1186 signaled a diplomatic realignment in Italy. The peace of Venice of 1177 had ended the conflict between the emperor and his Italian enemies: the papacy, Venice, the Lombard League, and the kingdom of Sicily. Under the conditions of the marriage, Frederick was required to relinquish the long-standing imperial claim to southern Italy, but he wanted to detach Sicily from the alliance that had led to his defeat in northern Italy. For his part, William II of Sicily sought to neutralize the Hohenstaufen threat so that he could freely attack the Byzantine empire. Neither Frederick nor William anticipated that Constance would succeed to the Sicilian throne, although at the curia of Troia in 1185 the Norman barons agreed to accept her as queen if William died without an heir.

When he departed on a crusade in 1187, Frederick Barbarossa named Henry imperial regent; but after William II died on 18 November 1189, Henry directed his attention to Sicily. A faction of Norman barons elected Tancred of Lecce, the illegitimate grandson of Roger II, as king and crowned him on 18 January 1190. Meanwhile, Frederick had died on his crusade, in 1189. Pope Celestine III crowned Henry VI emperor on 15 April 1191. Henry attacked Naples in May 1191, but disease drove the imperial forces out by August. At that time Constance was captured and sent to Tancred. Celestine negotiated her release, but pro-imperial forces rescued her and sent her to Germany before she could be delivered to the pope. Henry financed his return to southern Italy in 1194 with the ransom that he had extracted from the English king, Richard Lionheart, but effective opposition to the emperor collapsed with the death of Tancred on 20 February 1194. Henry quickly disposed of Tancred's nephew and successor, the child king William III, and was himself crowned king of Sicily in Palermo on 25 December 1194.

Constance, who was then forty years old, gave birth to a son at Jesi on 26 December 1194. She named him Constantine, but he was subsequently renamed Frederick Roger. A rumor later circulated that Frederick was not Constance's son, and a legend arose—which was unfounded—that she gave birth publicly to dispel such doubts.

Constance left the infant Frederick in Fo-ligno, where he lived until age three.

Henry ruled Sicily with a heavy hand. At the curia of Bari in 1195, he clarified the nature of the union between the empire and the kingdom, thereby reducing the tension between the Norman barons and his German followers. Constance was crowned queen at Bari. Henry returned to Germany in 1195. Constance ruled the Sicilian kingdom day to day and issued diplomas in her own name. In Germany, Henry pursued a scheme to make the imperial title hereditary. He failed in this, but he did manage to have Frederick elected king of the Romans in December 1196. In 1197, Henry returned to Sicily. Constance spent Easter with him in Palermo, where he renewed a far reaching revocation of privileges. A revolt against Henry ensued, but the emperor crushed it by July. Some German sources suggest that Constance played a role in the conspiracy against Henry, but he apparently did not act on reports of her complicity. Henry and Constance continued to live together and to issue diplomas jointly.

Henry died in Messina on 28 September 1197. Constance quickly secured the kingdom. She hastened to Palermo, where she deposed the chancellor and recovered the royal seals; she recalled Frederick from Foligno; and she expelled from the kingdom the German barons who had been most closely associated with Henry. Constance negotiated an accord with the Roman curia for the coronation of Frederick and the burial of Henry, who had been excommunicate when he died. To obtain the cooperation of Pope Innocent III, she conceded Frederick's imperial title. Henry's funeral took place in Palermo in early May 1198, and Frederick was crowned on 17 May. Constance continued to use her imperial title but issued diplomas jointly with Frederick after his coronation.

Constance was an active ruler, and her position was secure, but she negotiated with Innocent to define the feudal status of the kingdom and later to obtain papal protection for Frederick after her death. Innocent forced her to relinquish traditional royal rights over church councils, legates, appeals, and elections. She retained only the right to approve a bishop-elect before he could occupy his see. The pope sent a cardinal to receive her homage and confer vassalage, but she died before he arrived. Frederick does not seem to have felt bound by her concessions

to the papacy until he renewed them in 1212.

On 25 November 1198, Constance wrote her last testament. She commended Frederick to the protection of the pope as regent and guardian and directed her subjects to swear fidelity to the pope. She died on 27 or 28 November and was buried in the cathedral of Palermo, next to Henry VI, on 29 November. The papal regency notwithstanding, her death initiated a period of violence and chaos in the kingdom of Sicily that persisted until Frederick reached his majority in 1208.

The legend that Constance had once been a nun developed in the thirteenth century and was used by papal polemicists in anti-Hohenstaufen propaganda. Constance was said to have been raised in monastic solitude and to have taken religious vows, only to be torn from the contemplative life to marry Henry. Dante immortalized her legend in *Paradiso* (3.113). Later, several religious communities claimed her, some as abbess. By the fifteenth century, San Salvatore in Palermo seems to have won the competition to claim Constance as a member.

Constance of Aragon and Sicily

Constance (1247-1302) was the daughter of Manfred of Ho-henstaufen, the illegitimate son of Frederick II. Her mother was Beatrice, daughter of Amadeo IV of Savoy.

By 1258, Manfred had acquired control of southern Italy and Sicily despite the papacy, which was fiercely opposed to the sons of Frederick II. On 23 June 1262, Constance married Peter, who was heir to Aragon, Catalonia, and Valencia and was persistently determined to recover royal rights. After the invasion of Sicily by Charles I of Anjou (1266), Peter's court became the focus of opposition to the Angevins; and Constance is said to have maintained Sicilian customs—including recipes for dove— at court. After the revolt of the Sicilian Vespers in March 1282, Peter claimed Sicily in right of Constance. During Peter's absence in Spain from 1283 to his death in 1285, she governed Sicily, remaining there during the reign of his son James I of Sicily (the future James II of Aragon). After James inherited the Spanish lands of the crown of Aragon and tried to hand Sicily back to the Angevins, she attempted to make peace between James and his younger brother Frederick, who was elected king of Sicily in 1296. Clearly, she had no enthusiasm for the idea that her own Sicilian inheritance might be given back to the house of Anjou. In early 1296, she faced the threat of excommunication by Pope Boniface VIII (with whom she eventually made her peace in person), but she was personally very devout. She had already founded a house of Poor Clares at Huesca in Aragon in February 1268; the Clares were favorites of her mother-in-law, the Hungarian princess Queen Violante of Aragon. In her later years, Constance dressed as a Clarissa; and she retired to take up a religious life in Barcelona, where she died. Dante described her as "the good Constance" (*la. buona Costanza, Purgatorio*, 3.143). Her belief in the justice of her cause undoubtedly helped fuel Peter III's enthusiasm for the Sicilian war, in the face of considerable opposition at home in Spain.

Constance, Peace of

After his defeat at Legnano by troops of the Lombard League (1176), Frederick I Barbarossa established a six-year armistice through the peace of Venice. During this period he created a new relationship with his Lombard territories, replacing an aggressive imperial stance with looser mutual obligations of feudal suzerainty. This would be formalized in the peace of Constance. In March 1183, Frederick sent four envoys to negotiate with communal deputies who had assembled in Piacenza. Discussions lasted until June, and the peace was published in Constance on 25 June 1183.

The peace of Constance was essentially a compromise that gave great latitude to the communes while retaining the lordship of the Holy Roman emperor over northern Italy. Vassals and subject citizens were to swear an oath of allegiance and vow to support the emperor, offering the traditional services to sustain him when he traveled through their territories (*mansionaticum, foderum, parata, spedizione*); in return, he vowed to travel through quickly. Frederick recognized the Lombard League and allowed its members to repair and augment fortifications and to retain certain regalian rights (over pastures, meadows, mills, bridges, and waterways). The communes also retained civil and criminal jurisdiction, with appellate jurisdiction in imperial hands. The emperor would invest, if not appoint, consuls, who would then take oaths of fealty. Frederick also formally pardoned the Lombard League, its allies, Ezzelino da Romano, and the marquis Obizzo Malaspina for past disloyalty.

Frederick achieved peace and stability; and the seventeen signatory communes treated this peace as a Magna Carta that formally

established their liberties. It became part of the constitution of the Lombard League and headed many communal cartularies of rights and privileges. It signaled a flowering of communal pride and territorial aggressiveness.

Constans II

Constans II (630-668; emperor of Byzantium, 641) was the second major emperor of the Herakleian dynasty. He succeeded as a child, under overbearing tutelage and amid recurrent revolts and dangers, as the Lombards pressed the empire's Italian territories, the Slavs penetrated the Balkan peninsula, and, above all, the Arab conquests expanded into maritime aggression aimed eventually at Constantinople itself. By the end of his teenage years, Constans asserted himself and faced these threats with energy and dedication, confronting the massive Arab fleet in the "battle of the masts" (655) and making the first efforts to drive back the Slavs in Europe.

However, Constans's harsh, autocratic personality made him increasingly unpopular. Also, alarmed by rebellion in North Africa and dissidence in Italy, Constans became impatient with the theological controversies that were raging in his day. In 648, he issued his *Typos*, forbidding further doctrinal debate. Those who persisted were harshly punished—notably Pope Martin I, who in 653 was arrested in Rome, brought to Constantinople, tried, condemned, and sent to die in brutal exile.

Popular indignation over the murder of his (probably treacherous) younger brother, Theodosius, in 660 is said to have impelled Constans to leave his capital, never to return. But Constans apparently decided, in a period when the Arab menace had relaxed, to direct his attention to the empire's precarious territories in the west. After a progress through Greek lands, Constans crossed to Italy. He was the first emperor of Constantinople to visit Rome since Theodosius I, and he marked his brief stay (in 663) by stripping the copper roofing off buildings such as the Pantheon in order to make coins to pay his troops. At first, he was successful against the Lombards, but he eventually met reverses and failed to end their threat to Italy. His oppressive fiscal impositions, like his personality, made him deeply unpopular. Apparently intending to consolidate the region against dangers from the Lombards and Arabs by introducing the new organizational system of the *themes*, Constans set up residence in Syracuse, Sicily. Whatever his intentions, they were cut short by his assassination (at age thirty-

eight) on 15 July 668 by a cabal of disgruntled retainers and military dissidents.

Constantina

Constantia (d. 354) was the daughter of Emperor Constantine I. When Constantine died in 337, he was survived not only by his three sons—Constantine II, Constantius, and Constans— but by two daughters, Constantina and Helena. Any study of Constantina is difficult because history and memory have preserved two strikingly different accounts: a historical account and a legendary account survive, and the latter had more influence in Italy and the medieval west than the former.

The historical Constantina followed the path expected of an emperor's daughter. During his reign, Constantine had arranged through political negotiations for Constantina to marry his general Hannibalianus, thus raising the general's hopes of someday ascending to the purple. Constantine encouraged these hopes, but no doubt more

to control a possible rival than to seek a worthy successor, since he had sons of his own. Nevertheless, the marriage to Constantina brought Hannibalianus a good deal of advantage. Constantine gave him the title "king of kings" and sent him to rule in Pontus (between Armenia and the Black Sea) with Constantina as his queen.

After Constantine's death, his son Constantius II had Hannibalianus killed and arranged another politically expedient marriage for Constantina, this time to her cousin Gallus. For a while, this marriage gave Gallus upward mobility. Constantius made him *caesar* in 351, and Gallus and Constantina both participated actively in the upheavals that went on for years after Constantine's death. Constantina seems to have been equal to her brothers' bloody politics. The historian Ammianus Marcellinus—whose hyperbole, however, makes it necessary to read him cautiously—described her as "a Megaera in mortal guise, . . . being as insatiable as [Gallus] in her thirst for human blood." Ammianus recounts (in book 14.1) that she worked closely with her husband in the conspiracies that led to Gallus's murder in 353. Constantina herself died a year later, and her body was buried in Rome.

In sharp contrast, the legendary Constantina is portrayed as a Christian exemplar bearing no resemblance to the historical figure. In legend, Constantina was cured of leprosy at the tomb of Saint Agnes in Rome and, out of gratitude, took a vow of Christian chastity. The legend then tells how she resisted an arranged marriage, converted her fiancé, and left her wealth to her servants John and Paul to use for Christian purposes. The legend of Constantina was preserved in a *Vita* that combines a life of Constantina with a life of Gallicanus (her betrothed) and of John and Paul (her servants).

The legend of Constantina persisted at least partly because its written version was so popular. The *Vita* spread through western Europe and, in addition, was circulated during the seventh century by the Anglo-Saxon Aldhelm. Aldhelm included material on the legend of Constantina in his *Carmina de virginitate* (*Songs of Virginity*), a text that remained popular until the twelfth century.

In Italy, the continuation of the legend was ensured by the association of the legendary Constantina with the fourth-century tomb of Santa Costanza, near the basilica of Saint Agnes, the site of Constantina's reputed miraculous cure. Constantine probably built

Santa Costanza for his pious sister, Constantia, not for his politically-minded daughter; and the piety that led to the building of the tomb of Santa Costanza was also probably Constantia's—but the reputation for piety devolved to Constantina. The legendary virgin daughter of Constantine has left a greater historical mark than the historical wife of two pretenders to the throne,

Constantine the Great

Constantine I the Great (c. 285-337) was born to the Roman co-emperor Constantius Chlorus and his wife, Helena. Constantine inherited his father's power on the latter's death in 306 and, through a series of alliances and military conflicts, eventually gained supreme authority over a united Roman empire. In 312, Constantine defeated Maxentius, his rival and brother-in-law, at the Milvian Bridge just outside Rome, to become the senior ruler of the west; in 324, Constantine defeated Licinius at Chrysopolis to become the sole emperor of both east and west. He then rebuilt the eastern capital, Byzantium, which was renamed Constantinople in 330, and established the central seat of the Roman empire there. When Constantine died, he was buried at Constantinople in the Church of the Twelve Apostles. In the east he has been known as the thirteenth apostle; and as a saint he is recognized by a feast day, 21 May. Constantine's life was celebrated by Lactantius, by Eusebius of Caesarea's panegyric *Life of Constantine*, and by the city bearing his name, which remained the capital of the eastern Roman empire until 1453.

Constantine the Great. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 129r.

As emperor, Constantine implemented several administrative and military reforms begun by his predecessor Diocletian. He reorganized the army and separated the civil and military branches of the government. He reinstated the senate as the governing class, and he issued new gold coins which became the standard unit of international exchange for seven centuries. Perhaps most important, his rule proved crucial to the development of the Christian church. Like his father and the earlier third-century emperors, Constantine had worshiped pagan gods, especially the Roman sun god, Sol. Despite his pagan upbringing, however, his early reign had been marked by religious toleration. At the time of his victory over Maxentius in 312, Constantine's faith took a consequential turn, and the emperor appeared to make a strong commitment to Christianity. According to divergent accounts of the event, on the eve of the battle Constantine saw, in a dream or a vision, an image of the cross and the words "with this sign you will conquer" (*in hoc signo vinces*). Apparently, he then had the cross or, alternatively,

the first two letters of Christ's name inscribed on his soldiers' shields for the decisive conflict; and when he won, he attributed his victory to God's intervention. In subsequent military campaigns he used the sign of the cross as a battle standard. While the details of this episode vary from source to source, it does appear that Constantine believed he had entered a contractual relationship with God at the Milvian Bridge, and this belief was reflected in his imperial policies toward Christianity.

In 313, with the cooperation of Licinius, who was then the eastern emperor, Constantine issued the Edict of Milan, allowing for freedom of worship and the restitution of confiscated property to the church. Throughout his reign, Constantine continued to strengthen the position of the church through legislation; for example, he established Sunday as a public holiday and partially exempted the clergy from taxes. The emperor's support of the church also extended to building projects; Constantine built and endowed Christian churches in the Holy Land (where his mother, a believer who is associated in legend with the rediscovery of the True Cross, often visited), Constantinople, Antioch, and Rome.

The dissension that fractured the church at this time necessarily engaged the emperor as well; Constantine was personally involved in addressing the Donatist and Arian heresies. He summoned two synods

to consider the Donatist heresy before finally hearing the case himself in 316. When he judged the case adversely, the Donatists rejected the imperial decision; for five years thereafter they were repressed by force, until Constantine abandoned the issue. As for the Arian heresy, Constantine convened and presided over the First Ecumenical Council at Nicaea in 325, which ruled against the Arians, although Constantine's personal position on the controversy seemed to waver in the years that followed.

Constantine has been called the first Christian emperor, and by the end of his reign Christianity had indeed achieved a considerably stable position within the empire. However, he was not baptized until the end of his life; and apparently the rite was then administered by an Arian bishop, Eusebius of Nicomedia. Myths surround his baptism, though; and an imaginative account of the event circulated widely in the Middle Ages through the *Golden Legend* (*Legenda aurea*). According to this tradition, Constantine contracted leprosy as a divine punishment for persecuting Christians. He was told to bathe in the blood of 3,000 infants as a cure but felt such pity for the children that he set them free. That night, he received a vision of Saints Peter and Paul, who instructed him to heal his disease through baptism. The following morning, Constantine sent for Pope Sylvester, who had been hiding on Mount Soracte. The pope baptized him, and Constantine proclaimed that Christ was to be worshiped in Rome as the true God. The popularity of this legend is attested to by Dante's references to it in *Inferno* (27.94) and *Monarchy* (3.10), although in *Monarchy* Dante is careful to indicate that the story may not be historically accurate.

In some versions of the apocryphal tale of the baptism, Constantine put his newfound support of the Christian church into writing, in the form of the Donation of Constantine; in other versions, Constantine produced the Donation when he transferred his seat of power to Constantinople. In reality, the Donation is an eighth-century forgery of Frankish origin, called the *Constitutum Constantini*, which purports to pledge, in the name of Constantine, the temporal power of the west to the church. In the first 155 lines of the document, the *Confessio*, the fictional "Constantine" addresses Pope Sylvester and all subsequent popes and bishops, relating to his readers what Jesus Christ accomplished through the apostles Peter and Paul, by means of the

miracles of Pope Sylvester. The narrative makes use of early medieval legends surrounding Pope Sylvester, recontextualizing them within "Constantine's" confession of faith. The remainder of the work, the *Donatio*, purports to endow the Roman church with power over the western regions of the empire. The *Donatio* exalts the Roman church over all other churches; bestows the Lateran Palace on the papacy, promising to build a church there in honor of Christ the Savior; and grants the Roman clergy the right to bear imperial insignia and privileges. Most important, on relocating the seat of the imperial government to the east, "Constantine" confers on Pope Sylvester power over the city of Rome, the province of Italy, and all of the western empire.

The purpose behind this forgery is not entirely clear. While some of Constantine's policies did indeed benefit the Roman church financially, socially, and politically, there is no evidence that the emperor officially signed over the western region of the empire to the papacy. The Donation may, then, have been written with the purpose of reinforcing Rome's claims to the papal states, or it may simply have functioned as a literary fiction or hagiographical legend with no express political purpose other than to exalt the Lateran Church of the Savior. In any case, belief in the authenticity of the document was widespread in the Middle Ages. It was copied many times, and it was used to fortify the position of the papacy against the eastern church. In the late eleventh century the reformed papacy utilized the *Donatio* to achieve autonomy from the emperor and dominion over the papal states. Moreover, since the document was familiar to medieval canon lawyers, it was used extensively to uphold the temporal sovereignty of the papacy whenever that sovereignty was challenged.

Dante, too, accepted the Donation as genuine, although he may not have known the document directly. Despite his belief in the document, however, Dante questioned the juridical value of such a charter on the same basis that civil lawyers of the twelfth and thirteenth centuries questioned it. Dante claims that Constantine did not have the authority to give away the privileges of the empire—as emperor, he could not effectively compromise his own position—and that the church was not authorized to accept them, since in Matthew 10:9 Christ himself forbade his followers to accept material goods (*Monarchy*, 3.10). In the

Commedia, Dante frequently deplores the Donation as the turning point in church history, the moment when spiritual issues were subordinated to political and financial concerns. According to Dante, Constantine's gift to the church, which he linked with Constantine's move to the east, made possible the material corruption that later characterized the papacy. Although Dante does not blame Constantine directly, placing him in paradise among the just rulers in the sphere of Jupiter, he maintains that whatever Constantine's intention, the Donation yielded only evil (*Paradiso*, 20.55-60 and 6.1-3; *Inferno*, 19.115-117 and 27.94; *Purgatorio*, 32.124-129; *Monarchy*, 1.16.3 and 2.11.8).

In 1440, Lorenzo Valla applied the tools of humanist philology to condemn the Donation as a forgery (Nicholas of Cusa had briefly done the same seven years earlier). Valla's scholarship allowed for the denunciation of papal claims and thus bolstered the arguments of Protestant reformers who wanted to promote the more spiritual aspects of the church's mission.

Constantinus Africanus

Constancinus Africanus (d. 1087) was born in Tunis in North Africa. As a Saracen merchant, he brought medical texts in Arabic from North Africa to the Benedictine monastery of Monte Cassino in the mid-eleventh century. He then became a monk there and translated these texts into Latin for use by physicians in nearby Salerno. Constantinus's translations include the *Pan-tegni* of Ali ibn Abbas (d. 994), the *Viaticum* of Ibn al-Jazzar (d. 1004 or 1009), and the works of Isaac Israeli (d. 932). His translations of the writings of the ancient Greek physicians Hippocrates and Galen formed the basis for *Articella*, a collection of medical works that was one of the most popular of the Middle Ages. He died at Monte Cassino.

Constitutions of Melfi

The Constitutions of Melfi, also known since the thirteenth century as *Liber Augustalis*, represent one of the earliest efforts at royal codification in medieval Europe. They are pivotal for an understanding of the reign of Frederick II, king of Sicily (1198-1250) and Holy Roman emperor (1220-1250), who promulgated this legislation at Melfi in Apulia in 1231 for the kingdom of Sicily. Drawing on legislation by Frederick's Norman predecessors as well as Lombard and Romano-Byzantine legislation, the constitutions reflect a revival of legal learning in the twelfth century. Frederick's earlier legislation (c. 1220) set the tone for the collection, which reveals a strong debt to both Roman and canon law. Given the heterogeneous historical background of southern Italy and Sicily, it is not surprising that the institutions show considerable diversity. However, they are less diverse than has been popularly believed. Thus there is little direct Arabic influence, despite the fact that Sicily was under Muslim rule until the late eleventh century. Nor are Byzantine influences as strong as might be expected. A Greek translation— actually more of a paraphrase—was made shortly after the laws were promulgated, but this was not done at the royal behest. The Constitutions of Melfi are chiefly a monument to the

development of western law.

Since earlier critical interpretations of Frederick and his reign emphasized almost exclusively his conflicts with the church and papacy, it was inevitable that the Constitutions of Melfi should have been viewed in that light. In fact, however, they were promulgated during a period of good relations between the emperor and Pope Gregory IX, following the resolution of a conflict raised by Frederick's leadership of a crusade while he was excommunicated and Gregory's invasion of the kingdom of Sicily in 1229. After the treaty of Ceprano in 1230, the emperor and the pope were endeavoring to work together to resolve outstanding issues. The constitutions, then, reflect this atmosphere of cooperation much more than the earlier tension.

There is some evidence from two letters written by Gregory on 5 July 1231, before the promulgation of the constitutions, that he was alarmed by a supposed threat in the legislation to the status of the church. He complained to both Frederick and Archbishop James of Capua. However, the final product was actually quite favorable to the position of the church, save for the inclusion of the assizes of Capua, originally issued in 1220, which were aimed against usurpations of rights of the royal domain. Since these assizes had aroused considerable controversy even as late as 1225, their inclusion may have caused complaints to Rome. But there is no specific evidence that this was the case, and the promulgation of the Constitutions of Melfi called forth no protest from Rome.

The compilation of *Liber Augustalis* was undertaken by a royal commission appointed in 1230. The membership of this commission is not known, though Gregory's letter makes a strong case that Archbishop James was a member, most likely representing clerical interests, as is suggested by that letter. An early and probably well-founded tradition has assigned a leading role to Petrus de Vineia, a legal scholar who studied at Bologna and who served as *logothete*, or chief spokesman and secretary, for Frederick until nearly the end of his reign, when Petrus was accused of treason and deposed.

A substantial portion of the laws are reissues of those of Roger II, William I, and William II. Frederick also repromulgated legislation he had first issued after his reentry into the kingdom in 1220, following his long sojourn in Germany and his coronation as emperor. In the

proemium to the Constitutions of Melfi, Frederick explained the need for this code in terms of the long period of turmoil that had troubled the kingdom during the reign of his parents and his own minority. Book 1 opens with legislation against heretics, a reaffirmation of the position he had taken at his imperial coronation. It also dwells heavily on issues of peace and justice and the royal administration. Book 2 is concerned with civil and criminal procedure. Book 3 asserts the rights of the crown over the royal domain. Like all medieval lords, lay and ecclesiastic, Frederick placed considerable emphasis on the defense of his rights; indeed, this concern provided grounds for his conflicts not merely with the nobility and churchmen of the kingdom of Sicily but also with the Lombard communes and the papacy. Much of the tone of the Constitutions of Melfi reflects Frederick's earlier legislation, which aimed at tightening loopholes and strengthening royal power, goals which lay at the heart of medieval administration in the thirteenth century.

There are numerous editions of the Constitutions of Melh. Cervonius (1773) remains of fundamental importance because of its editions of the legal commentaries of the Angevin period. The most recent edition (as of the present writing) is that prepared by Conrad and his colleagues (1973-1986). The Greek text was published, along with the surviving fragment of Frederick's register, as *Constitutiones regum regni utriusque Siciliae ...* (1786); it was reedited as the final volume in the Conrad edition. An English translation was prepared by Powell (1971). For the sources of the legislation, see Dilcher (1975).

Conti Family

The Conts da Segni and its branches constituted one of the most powerful families in thirteenth-century Rome. Their name denotes their title: they were the *conti*—counts—of Segni, a small area south of Rome in the Volscian hills. They were descended from the Lombards.

By the mid-twelfth century, Count I rasimund was respected enough to marry into an eminent Roman family, the Scotti. His son, Giovanni Lotario, had an excellent education and became Pope Innocent III (1198-1216). Two of Innocent's relatives also became popes during the thirteenth century: Ugo, who was Innocent's nephew, became Gregory IX (1227-1241); and Riccardo, Gregory's nephew, became Alexander IV (1254-1261). Innocent's brother Riccardo (d. 1225) took additional titles—lord of Poli and Guadagnolo in 1204, and lord of Valmontone and Count of Sora in 1208. Riccardo's son, Stefano (d. 1254), became a cardinal (1216) and vicar of Rome. Riccardo's inheritance was divided by his other two sons, Paolo (a proconsul of Rome in 1238) and Giovanni (d. 1261, a Roman senator). Paolo gained the title to Valmontone, and Giovanni the lordship of Poli and control of the Torre dei Conti in Rome, which had been built by his father; the stump of this tower still overshadows the Forum of Nerva. Giovanni's descendants included another Giovanni (d. 1332), successively bishop of Pisa and Nicosia; and the Franciscan theologian Andrea (d. 1302). This line died out in the mid-1300s. Paolo's descendants included Ildebrandino, who was an important functionary at the Avignonese papal court and a friend of

Petrarch.

Convenevole Da Prato

Convenevole (c. 1270 or 1275-c. 1338) was born into a Ghibel-line family in Prato. He became a notary like his father and brother Filippo, and also took holy orders in 1293.

In 1306, he moved to Pisa, where he may have met *ser* Petracco and Petracco's young son, Francesco (Petrarch), in 1311-1312. Convenevole next moved to Avignon. From 1312-1316 he tutored both the young Petrarch and Guido Sette in grammar and rhetoric. Petrarch remembers his first teacher in several letters, although he never identifies Convenevole by name; however, Convenevole is named by Filippo Villani in *De Florentinis illustribus viris*. Petrarch would later claim that when he was still young his own literary abilities already exceeded those of his teacher (*Familiarum rerum libri*, 24.1). If we are to believe Petrarch, Convenevole seems to have led a miserable existence, making a poor living as a schoolteacher, Convenevole was a close friend of Petrarch's family and was often helped financially by Petrarch's father—and, after the father died in 1326, by Petrarch himself. In his *Rerum senilium libri* (16.1), Petrarch relates a sad story about his former

schoolmaster: Petrarch lent Convevole Cicero's *De Gloria* and later discovered that Convevole had pawned the volumes and could not afford to redeem them; shamed by his betrayal of his pupil's trust and the loss of the books, Convevole fled to Tuscany, and Petrarch never saw him or the books again. However, Billanovich (1997) calls this story a *fiaba trasparente* (fairy tale), and the historical evidence does suggest a more prosaic version. Petrarch may never even have possessed Cicero's *De Gloria*, and he probably invented the story for dramatic effect.

Convevole was offered a position as a grammar professor in Prato in 1336 and was thus able to return to his home before he died (probably in early 1338). One work has been attributed to Convevole: *Regia carmina*, a collection of poems written in honor of Robert of Anjou.

Coppo Di Marcovaldo

Coppo di Marcovaldo (fl. 1260–1276) was most likely born in Florence, and he is the first Florentine artist to be known by name. The

beginnings of his artistic career are murky, though it has been suggested that he trained in the studio of the Master of the Bardi Saint Francis, and that early in his career he assimilated some aspects of Giunta Pisano's emotionally charged approach.

Coppo is first documented in February 1260, when he is listed in the Florentine register of soldiers as *coppo dipintor*, a shield bearer in the war against the Sienese, which ended in the disastrous defeat of the Florentines at the battle of Montaperti in September 1260. According to popular tradition, he was held by the Sienese as a prisoner of war, and his sole surviving signed and dated work—*Madonna del Bordone*, painted for the church of Santa Maria dei Servi in Siena in 1261—was made in exchange for his release.

Coppo is next documented as the owner of a house in Florence in 1265, and as receiving payment in 1265 and 1269 for frescoes, now lost, in the chapel of San Iacopo in the cathedral of Pistoia. He is documented again in 1274, as working for the cathedral of Pistoia: executing a Crucifix and two panels of the Madonna and Saint John for the choir, and another Crucifix and a figure of Saint Michael for that saint's chapel in the cathedral, San Michele. Of these panels, executed with considerable assistance from his son Salerno, only the Crucifix in the San Michele chapel is extant. Coppo's final recorded activity relates to his painting of a "solarium" above the altar and choir of the cathedral of Pistoia in 1276.

Only two works are widely accepted as representative of Coppo di Marcovaldo's style; the *Madonna del Bordone* in Siena and a Crucifix (number 30) in the Pinacoteca Civica of San Gimignano. *Madonna del Bordone* is significant both for its size (7 feet 3 inches by 4 feet, or 2.18 by 1.2 meters) and for the sense of monumentality it conveys. This panel is among the first of the large-scale maestas that became so popular in the late thirteenth century. The linearity and compartmentalization of form in this panel clearly show Coppo's links to the Byzantine style, but the result is utterly removed from the formulaic schematization of the Byzantine school. Coppo's compartmentalized structures, such as the rolled-up blanket supporting Christ, are put to the service of a more simplified, more powerful rendering of clear, legible shapes. The schematization of Mary's dress articulates the form of her body beneath the drapery remarkably

effectively, and conveys a convincing three-quarter turn of the body into space. This panel seems to have been considered an important object of devotion, for the head and hands were repainted during the early *Trecento* in the popular Ducciesque idiom to keep it up to date. X-rays of Coppo's original treatment of the faces, still intact beneath the fourteenth-century repainting, reveal a kinship with the elongated forms, especially the eyes, seen in the Crucifix in San Gimignano.

The Crucifix in San Gimignano continues the expressionistic tendencies of Giunta Pisano's crucifixes and is a very evocative example of the *Christus patiens* (suffering Christ) type. It achieves

monumentality of form through broadened, simplified, carefully modeled, almost sculptural masses and combines these with a sharp jagged line whose brittle angularity perfectly expresses Christ's suffering. In this work and *Madonna del Bordone*, one finds early evidence of a tendency toward simplification and monumentality and an interest in expressive intensity that would be hallmarks of the Florentine Renaissance. Coppo's influence on his immediate successors, such as Cimabue in Florence and Guido da Siena, was fundamental to the subsequent development of their schools.

Correggiaio, Matteo

We know very little about the poet Matteo Correggiaio (probably late thirteenth century-mid-fourteenth century). Scholars have for some time been perplexed by the fact that Correggiaio appears only in the historical records of Bologna, although he is listed in the anonymous *Leandreide* (1383) as a poet of the Veneto. In a translation of a French text, the poet calls himself "Mathio Corezaro de Pava," i.e., Padua, if he was indeed a native of Padua, it seems likely that his early childhood was spent in Bologna.

Very little of Correggiaio's poetry survives; we have only thirteen compositions of certain attribution. His themes are those of the *dolce stil nuovo*, and he is indebted as well to Fazio degli Uberti and to the Dante of the *rime petrose*. Correggiaio's major contribution was his ability to fuse aspects of all these literary influences into an intelligent and cohesive whole (as in *Gentil madonna, mia speranza card*). His unique predilection for complex literary composites is evident in the multilingual poetry he exchanged with Antonio da Tempo, in which there are alternating lines of Italian and French or Provencal.

Corsica

Corsica, an island in the Tyrrhenian Sea 7 miles (about 11 kilometers) north of Sardinia across the strait of Bonifacio, has a rich history and survivals of prehistoric settlement. It was caught up in rivalries between the Greeks, Phoenicians (Carthaginians), and Etruscans, and ultimately in the wars between Rome and Carthage. Corsica was incorporated into Roman administrative structures by 227 B.C. and became a prosperous center in the empire. During the Germanic invasions of the fifth century after Christ, the island was seized by the Vandals under Gaiseric (450). In the sixth century, it was seized by Belisarius as a part of his conquest of Vandal North Africa (534). It was conquered by the Ostrogoths under Totila in 549 but was restored to the rule of Constantinople shortly thereafter and incorporated into the Byzantine exarchate of North Africa (Carthage).

The early Christian organization of Corsica was consolidated by Pope Gregory I the Great, who established the first bishopric at Ajaccio. Corsica was incorporated into the kingdom of the Lombards following their conquest of Pisa in 725. According to Charlemagne's confirmation in 774 of the Donation of Pepin, Corsica was intended to be under papal rule, but it actually came under the jurisdiction of the Frankish lords of Tuscany. Raids and attacks by the Saracens became increasingly frequent and disruptive, and eventually they came to dominate the island for about three centuries. Pisa recovered Corsica for Christianity by making two expeditions against it (1014 and c. 1050) in alliance with the Genoese. It was reclaimed by the papacy; and in 1078 Pope Gregory

VII placed it under the jurisdiction of the bishop of Pisa as his apostolic legate. In 1091, prompted by Countess Matilda, Pope Urban II reaffirmed the jurisdiction of the bishopric of Pisa, which in the following year was elevated to an archbishopric; the bishoprics on the island were made his suffragans.

The ecclesiastical control of Corsica by Pisa confirmed a strong influx of Tuscan cultural influences. The island became an object of intense competition between Pisa and Genoa, and by the mid-twelfth century the ecclesiastical jurisdiction of Corsica had been transferred to the see of Genoa. This transfer was followed in 1195 by a definitive military takeover of the island. Pisan feudal families who were already present in Corsica were incorporated into new Genoese organization; but dissidence continued to plague Genoa's control of the island, and attempts by some rebels to seek aid from Pisa contributed to hostilities between Genoa and Pisa at the time of the battle of Meloria (1284). The Genoese were the victors in that battle, and thereafter they imposed more concentrated control over Corsica, until Pope Boniface VIII, antagonized by the hostile policies of both cities, awarded Corsica and Sardinia to James II of Aragon. James's efforts to control the island proved to be more disruptive than effective. Genoese rule continued, but it was complicated by factional strife among the Corsicans, which culminated in an attempt by Sambucuccio d'Alando to form a federation of cities and parishes in 1359. Dissatisfied with this situation, the Genoese government handed over the administration and exploitation of the island to a Genoese commercial corporation (*maond*) in 1378. From 1396 to 1409, as a part of the submission of the Genoese republic itself to the French crown, Corsica came first, if briefly, under French occupation, anticipating its fate in later times.

Cortenuova, Battle of

The battle of Cortenuova (1237) was the greatest victory of the Hohenstaufen emperor Frederick II in his struggle to control northern Italy. In 1235, the eleven cities of the Second Lombard League had reaffirmed their determination to oppose Frederick's efforts to dominate them, and so he mustered a strong army of German and Italian forces to reduce the league by military as well as diplomatic means. In late 1237, when the campaign season seemed to be over, Frederick's army caught up with the full Lombard forces at a river crossing near the town of Cortenuova, between Brescia and Bergamo, and defeated them on 27 November. Although the disorganized Lombard army had been defeated easily, the Milanese soldiers stubbornly rallied around their symbolic *carroccio*—the war chariot that bore their standard—and were slaughtered in huge numbers. Thus the prime forces of the Lombard League were devastated, and Milan's honor, in particular, was debased. Frederick had the *carroc cio* sent as a gift to the antipapal commune of Rome, to be displayed as propaganda in the Campidoglio.

Frederick's victory at Cortenuova put him in a commanding position in northern Italy for the rest of his reign. However, resistance against him continued, so that ultimately he could not make decisive use of this victory.

Cortona

Cortona, a city in the province of Arezzo in Tuscany, was once an important Etruscan and Roman center. It became part of the diocese of Arezzo in the early Middle Ages. The expansion of the commune of Cortona into the surrounding countryside in the mid-twelfth century was accompanied by an immigration of the rural nobility into the town. There, they formed a substantial noble class (*magnati*), which was opposed by a strong middle class (*popolo*) during the thirteenth century.

Three bishops of Arezzo—Martino (r. 1212-1236), Marcellirio (r. 1236-1248), and Guglielmino degli Ubertini (r. 1248-1289)—encouraged factional rivalries in Cortona so that they could pursue their own jurisdictional claims, which the town had resisted. During the night of 1 February 1258, an armed force from Arezzo instigated by Bishop Guglielmino, which included Guelf *magnati* exiled from Cortona, captured the town and sacked and destroyed it. Many of the Ghibelline noble families and prominent families from the *popolo* fled to the protection of Perugia.

The battle of Montaperti (4 September 1260) created the conditions for a truce between the two factions, the return of the exiled Ghibellines, and peace with Bishop Guglielmino (1261). Under this peace, Cortona became bound to the bishops of Arezzo, recognizing their jurisdictional rights (including the choice of *podesta*, or city magistrate), and was forced to accept Arezzo's allies and enemies as its own. Later, in 1289, Bishop Guglielmino and the Ghibellines were defeated at the battle of Campaldino (11 June). The relations between Arezzo and Cortona that had been established in 1261 (and reestablished in 1266) were not improved by this defeat.

The treaty with Bishop Guglielmino of 1261 heralded the rise of the Casali family. Uguccio Casali, one of the Ghibelline leaders, had been the principal agent in the treaty and became the bishop's trustee. Uguccio was *podesta* of Cortona (1265) and Arezzo (1280) and *capitano delpopolo* in Pisa (1298-1299). In Cortona, he allied himself with the *popolo*; in 1278 he became the *priore dei consoli e delle arti del popolo del comune di Cortona*, i.e., prior of the consuls and guilds of the *popolo*. Thus two rival groups of *magnati* emerged in Cortona: one

group was tied to the old feudal landlords; the other, led by Uguccio, was more flexible, more closely integrated into the town, and better disposed toward the *popolo*. After Uguccio's death, the rise of the Casali family continued; his son, another Guglielmino, became *podesta* of Arezzo (1308), *vicario imperiale* of Cortona (1313), and *maggiore gonfaloniere generale* (1314 and 1316). The office of *gonfaloniere* (standard-bearer) strengthened this Guglielmino's ties with the *popolo*.

Having gained power in Cortona in 1319, the *popolo* succeeded in thwarting two conspiracies by the *magnati* (30 November 1323 and 25 July 1324). Guglielmino Casali's sons, Ranieri and Uguccio, played a decisive role in these episodes on the side of the *popolo*; this greatly strengthened their party, which after 1324 controlled all the main public positions in the commune.

Events in Arezzo then became decisive for Cortona. The expansionist policies of Bishop Guido Tarlati of Arezzo (r. 1312–1327) at the expense of Florence and the papacy forced Pope John XXII (Giovanni, r. 1316–1334) to act. The pope, who was sympathetic toward the ambitions of the Cortonese, broke the subjugation of Cortona to the diocese of Arezzo, creating a new and autonomous episcopal see (19 June 1325). Cortona then naturally supported the pope, Florence, Siena, and Perugia against Bishop Tarlati. Such developments in Arezzo—to which the *magnati* conspirators in the plots of 1323 and 1324 had been exiled—coupled with the preeminence of the Casali family and its followers led to the accession of Ranieri Casali to the *signoria* in Cortona, a position he held from 1325 to 1351. Immediately on his accession, he changed the constitutional charter (December 1325).

Because of the enduring hostility with Arezzo, Ranieri Casali reinforced his ties with other entities, particularly Perugia. Until the collapse of the *signoria* in 1409, the Casali family sought to maintain the autonomy of Cortona by leaning in turn toward one or another of its powerful neighbors—first Perugia, then Siena, and finally Florence—changing alliances when one of them became too restrictive. Thus Bartolomeo Casali (*signore* 1351–1363), Ranieri's son, broke an alliance with Perugia (1358) and made one with Siena that continued under his successors Francesco (in 1363–1375) and Niccolo Giovanni (in 1375–1384).

After annexing Arezzo (1384), Florence became a neighbor of

Cortona, replaced Siena as Cortona's ally, and forced Cortona into a alliance, which was renewed in 1397 and again in 1401. The autonomy of Cortona ended in 1409 with the overthrow of Aloigi Battista Casali (*signore* 1407–1409), and in 1411 Cortona, too, was annexed by Florence.

Councils, Ecclesiastical

The periodic holding of councils or synods (i.e., gatherings)— the terms were used as synonyms until the twelfth century and are so used here) —was and is a constant feature of historical Christianity. Beginning with the assembly of the apostles in Jerusalem (c. a.d. 52) to decide whether Gentile Christians were obligated to follow the law of Moses (Acts 15:1-30), bishops met with each other and with abbots and the monastic and secular clergy, as well as with members of the laity, to find and lay down solutions to common problems. Such problems might be disciplinary or pastoral (e.g., involving regulation of lifestyle and dress), administrative (e.g., involving property disputes), or doctrinal (e.g., involving baptism and heresies). The councils varied greatly with regard to their composition, attendance, frequency, and scope, depending on historical circumstances. Generally, however, we can distinguish diocesan synods (one bishop with his clergy); provincial or metropolitan councils (at least one archbishop, or metropolitan, with

the bishops of his archdiocese, known as suffragan bishops); ecumenical councils; and papal, or general, councils. In the west, many general councils are also ecumenical. The so-called national councils in the Germanic kingdoms can be subsumed under provincial councils.

A council was usually a most solemn occasion, at least whenever the early medieval *Ordo de celebrando concilio* (*Rule for Conducting a Council*, transmitted in numerous manuscripts) was applied. Accompanied by prayers and exhortations, the assembly consulted and read, from a canonical collection set up in its midst, earlier conciliar legislation on the conduct of councils, also searching the collection for instructions on specific difficulties. *De ordine palatii* (ninth century) of Archbishop Hincmar of Reims described procedures for mixed councils, sometimes called national synods, when ecclesiastics, summoned by the kings, met side by side with—and for some sessions jointly with—royal secular assemblies. William Durant the Younger's *Tractatus de modo generalis concilii celebrandi*, written for the Council of Vienne of 1311-1312, strikingly illuminates the evolution of a different type of council and of early conciliarist thought. Conciliar decisions of general applicability were recorded as canons. During some periods, all participants signed the records. Unfortunately, these documents have rarely been preserved; nevertheless, a considerable number of individual decrees made their way into the canonical collections of the period and thus into the *Decretum*, or collected canons, of Gratian of Bologna (c. 1140). Other conciliar canons, especially those from the Carolingian period, were preserved among the capitularies of the Frankish rulers. Until the Gregorian reform of the eleventh century, ecclesiastical legislation was binding only on the basis of general acceptance and tradition, as evidenced by transmission in canonical collections. It was enforceable only through ecclesiastical sanctions, unless it had become part of royal or imperial legislation. With the Gregorian reform, papal approval—direct, indirect, or on the basis of noncontradiction with papal decrees—became the factor determining the validity of canons.

Ancient Ecumenical Councils

In accordance with the practice of the early ecclesiastical councils, Emperor Constantine I (r. 324–337) called the first "universal" or "ecumenical" (from *oikomenegē*, "inhabited earth") council of bishops of the whole empire, in order to end the Arian schism. The theory of Arius of Alexandria—that the son of God was not coeternal with God the father—had divided the church and thus impeded the proper worship of God, in the eyes of Constantine and his ecclesiastical advisers, led by Bishop Hosius of Cordoba. The famous assembly met at Nicaea in 325, from May or June to c. August. Although Pope Sylvester I sent two representatives, who were the first to sign the records, the initiative and leading role belonged to the emperor, in accordance with Roman senatorial procedure. Constantine convoked the bishops, presided over sessions of the council, explained the reasons for its convocation, and directed the individual interrogation of the bishops. The near-unanimous adoption of the Nicene Creed, defining the divine nature of the son, was due to imperial pressure; but while the key term "consubstantial" (*homoousios*) was also formally proposed by the emperor, we should note that it had originated with his episcopal advisers. In addition to the creed, the council also adopted twenty disciplinary canons.

The other six (in the Greek Orthodox east) or seven (in the Latin west) ancient ecumenical councils in general followed the example of Nicaea I. The Roman emperor would convoke the bishops of the empire to an assembly, in agreement with the bishop of Rome, in order to decide doctrinal quarrels and to regulate Christian discipline through canons. The first six ecumenical councils—Nicaea I (in 325), Constantinople I (381), Ephesus (431), Chalcedon (451), Constantinople II (553), and Constantinople III (680–681)—accordingly dealt with trinitarian doctrine and subsequently with questions of Christology. The seventh ecumenical council, Nicaea II (787), settled the question of the veneration of icons; and the eighth—in the west, Constantinople IV (869–870)—settled the schism of the patriarch Photios. All the councils except the sixth (Constantinople III) also promulgated disciplinary canons, which were published as imperial legislation and incorporated with the canons of other local synods in collections of canon law. Their validity in the west depended on their acceptance by the popes. Since all the ancient ecumenical councils were held in the east, the Latin west

was at best thinly represented. The popes never participated in person but usually sent their representatives.

Council of Nicaea. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 130v.

The exalted standing of the first four ecumenical councils was already reflected in the view of Pope Gregory I (597-604), for whom they were the equal of the four gospels. The canonists of the eleventh-century reform were responsible for the new emphasis on Constantinople IV (869-870), the council at which Photios had been formally deposed and Ignatios had been reinstated as patriarch. Legates of Pope Hadrian II had played a decisive role in the proceedings. The west was to accept this council as the eighth ecumenical synod. In the east, however, the Great Council of Union, held at Saint Sophia in Constantinople in 879-880 in the presence of papal legates, reinstated Photios and canceled the decisions of 869-870. Since the eleventh century, therefore, the eastern and western churches have diverged with regard to the enumeration of the old ecumenical councils. It must be stressed, though, that the modern Roman Catholic numbering of

ecumenical councils based solely on generally accepted tradition did not originate until the sixteenth century.

Papal or General Councils

Today the Roman Catholic church counts twenty-one ecumenical or universal synods:

Eight ecumenical councils of antiquity

Four general councils of 1123, 1139, 1179, and 1215 celebrated by the popes at the Lateran and therefore known as Lateran I, Lateran II, III, and IV

Two councils held at Lyon in 1245 and in 1274 (First and Second Councils of Lyon)

Vienne (1311-1312)

Constance (1414-1418)

Basel-Ferrara-Florence-Rome (1431 -1445)

Lateran V (1512-1517)

Trent (1545-1563)

First (1869-1870) and Second (1962-1965) Vatican Councils

This numbering had evolved by the sixteenth century, and the Vatican Councils are of course modern additions to the list. Thus the numbering was done in hindsight and does not necessarily reflect the contemporary importance of the papal councils. For instance, none of the great reforming councils of the eleventh century are included as ecumenical, yet they were celebrated by some of the most outstanding popes in the history of the church, beginning with Pope Leo IX (r. 1049-1054), and including Pope Gregory VII (r. 1073-1085) as well as Pope Urban II (r. 1088-1099), who initiated the First Crusade at the Council of Clermont (1095).

Leos great council, convoked at Reims in 1049, is well recorded. It illustrates the changed international stature of the reform popes, and their willingness and ability to look to and after the church in general, with far less emphasis on purely local Roman concerns. Reims reflected the involvement of the papacy in reform in the French royal and

nonroyal church, by imposing the new Roman understanding of simony (traffic in ecclesiastical offices) on the recalcitrant French clergy, regardless of whether King Henry I (1027-1060) liked it or not. However, the papal decrees issued at Reims also covered specifically French concerns, extending the papacy's support to the regulations of the Peace and Truce of God, which had been the ecclesiastical response in French synods to the disorder and insecurity created by feudal warfare. In other canons from Reims, Leo's reliance on ancient canonical collections is made clear; for example, his prohibition of usury dates back to the great council of Nicaea in 325. In a letter (JL 4185) sent later to the abbot of Saint Remy at Reims, the pope specifically mentioned that he had ordered the canons of his councils, including Reims, to be added to the old canonical collections. Clearly, Leo attached great significance to the councils and the canonical collections, transmitting their decrees together with statements of the church fathers and papal decretals. He may have held as many as eleven synods in Italy, France, and the empire during his relatively brief reign.

The councils or Pope Urban 11 had an even greater impact in France. This is especially true of the Council of Clermont (November 1095), which was made famous through the crusades but was also concerned with a multitude of other issues, many of them related to church reform. Earlier, in March 1095, at the outset of his journey to France, Urban had held the council of Piacenza. Its aims were both propagandistic and pastoral. Perhaps even more than Clermont, Piacenza celebrated the end of the papal schism, which had derived from northern Italy. The synod was a clear demonstration of Urban's wide support; its legislation was designed to heal the effects of the schism. Urban's presence in northern Italy would give added impetus and effect to a series of regulations—for example, about the legality of orders received by clerics from simonists and schismatics. Publicizing conciliar meetings and their decisions was a particular difficulty faced at that time. This problem was not to be solved until the Third and Fourth Lateran Councils, when more effective preparation for the meetings and better distribution of their decrees became possible because of the centralization of the papacy, the growth of universities and scientific canon law, and a vastly expanded and more sophisticated bureaucracy.

The councils of Leo IX and Urban II were held abroad. The effectiveness of the renewed papacy of the eleventh century at home, in Rome, was at least as significant for the success of the Gregorian reform. The Lateran Council of 1059, held by Pope Nicholas II (1058-1061), defined the relationship between the papacy and the Romans in its decree on papal elections. This decree—which was not signed by two ardent reformers, Hildebrand (later Pope Gregory VII) and the canonist Deusdedit—deprived both the Roman clergy and the population of Rome of any active participation in future papal elections. The cardinal bishops alone were to decide the election, consulting subsequently with the lower ranks of the cardinalate. Only then were the clergy and people of Rome to consent to the election— as was the German king, who as emperor-to-be had inherited the functions of a Roman patrician, i.e., participation in papal elections, from his father, Emperor Henry III. Moreover, the election decree envisioned the election of non-Romans to the see of Saint Peter. The writings of Cardinal Deusdedit reveal the outrage among the pro-Roman faction of the reformers, who resented the loss of traditional Roman rights.

what has been said so far should indicate the significance of papal councils in shaping the reformed papacy and thus influencing the later Middle Ages. All of them clearly reflect the enhanced stature of the papacy, the acclaim the popes found in the west, and an expanded vision of the papacy. This was the background of the general papal councils later called ecumenical. Their common features are that they were convened by the pope, who was present in person at the sessions and promulgated their decrees. The councils were attended by bishops, abbots, and procurators of ecclesiastical corporations; and by princes or their emissaries, who, however, had only a limited vote and a limited right to participate.

The four Lateran synods which are among the series of ecumenical councils accepted today in the west are a part of this tradition. Lateran I, held in 1123 by Pope Calixtus II (1119— 1124), is probably best-known for ratifying the agreements (later the Concordat) of Worms of 1122 between the pope and Emperor Henry V (r. 1106-1125). These agreements were only a truce, but they nonetheless represented the end of the investiture controversy, the final phase of the Gregorian reform that pitted the papacy against the kings of Europe. The Lateran I

decrees are a curious mixture, treating both general matters and local issues. Many of them repeat earlier canons promulgated during the eleventh-century reform.

Lateran I is the ninth ecumenical council; the tenth is the Lateran synod of 1139 under Pope Innocent II (1130-1143). This council defined the end of a papal schism, a fact that is probably responsible for its status. A set of texts survives from Innocent II's synods that was copied from council to council, "with only minor variations and omissions that could well be due to the form in which the canons survive" (Somerville 1972). Therefore, the legislation of Innocent's councils does not provide much of a basis for distinguishing between them.

The great council convoked by Pope Alexander III at the Lateran in March 1179 is, in part, remembered as an ecumenical council because it came at the end of the struggle between Alexander and Emperor Frederick I Barbarossa. As Somerville noted, it was very carefully planned and administered, "despite some protests against the inherent legalism that some churchmen saw usurping the true function of Christian ministry."

The Fourth Lateran Council of 1215 under Pope Innocent III (1198-1216) has been justly described as the high point in medieval ecclesiastical legislation. The canons were incorporated into the *Compilatio quarta* and later passed almost entirely into the *Decretales* of 1234. The invitations to clergy and laity from the eastern church (Constantinople had been taken by the crusaders in 1204) and the western church had been sent out more than two years earlier; the attendance of 412 prelates was a result of the careful preparation. The themes of the assembly were many; foremost among them were crusading efforts, a response to Albigensian and Waldensian issues and to the heretical opinions on the Trinity expressed by Joachim of Fiore. Two dogmatic constitutions resulted. The first, *Firmiter credimus*, was a profession of faith including the term *transubstantiatio* in the doctrine on the eucharist. The second was a specific condemnation of the propositions of Joachim and of Amalric of Bene. There were an additional sixty-nine disciplinary decrees.

The thirteenth-century general papal councils—Lyon I (1245) and Lyon II (1274)—followed essentially the same pattern. In 1245, Innocent IV (r. 1243–1254) had to deal with the threat represented by Emperor

Frederick II of Hohenstaufen (r. 1212-1250), a new crusade, aid for Constantinople, and measures against the Mongols. In 1274, Pope Gregory X (r. 1271 – 1276) focused successfully on a union with the Greek church and ecclesiastical reform, requesting testimonials from the church at large in preparation for the council. Over the opposition of some of the cardinals, the pope enacted at Lyon II the constitution *Ubi periculum*, instituting the conclave for papal elections.

The Council of Vienne of 1311-1312 is an oddity because it was entirely overshadowed by the events of Anagni and a response to the pressures exerted on the pope by Philip the Fair of France (1285-1314).

In many respects the councils held after the beginning of the Great Schism in 1378 were also different. Their attempts to heal the schism and to reform the church "in head and members" resulted in an effort to limit and control the papacy in the interest of reform through periodic general councils. The decree *Haec sancta* of the Council of Constance (1414-1418), the sixteenth ecumenical council, defined general councils as superior to the papacy in the matters of faith and as holding "power immediately from Christ" (Oakley 1983). The structure of the councils of the conciliar period differed substantially from the structure of the papal general council as it had historically evolved, eventually creating a confrontation between council and papacy. The Fifth Lateran synod (1512-1517) finally returned to the pattern of the old papal general councils.

Counts of Romena

Castello di Romena, Casentino. Photograph courtesy of Christopher Kleinhenz.

The Romena were a branch of the illustrious Guidi family, whose counts were among the most powerful in Tuscany during the twelfth and thirteenth centuries. The Romena took their name from their castle in the Casentino, the mountainous region east of Florence where the Arno has its source. Remains of the castle are still standing today, near Pratovecchio in the modern province of Arezzo. The first of the *conti* Guidi to live there was Aghinolfo (d. 1247), son of Guidoguerra III. It was to Aghinolfo's son, Guido I da Romena, that the poet Guittone d Arezzo addressed one of his vernacular epistles (*Conte di Romena*).

Guido I had four sons: Guido II, Aghinolfo, Alessandro, and Ildebrandino. In Dante's *Inferno* (Canto 30.73-79), Master Adam, burning with thirst and revenge among the falsifiers in the tenth *bolgia* of circle eight, denounces three of the brothers for whom he had counterfeited the gold florin:

There is Romena, where 1 falsified the currency stamped with the Baptist...
if I could see here the miserable soul of Guido or of Alessandro or of their
brother, I would not give the sight for Fonte Branda. One of them is here
within already.

(Singleton's translation)

The one "within already" is generally taken to be Guido II, who died in

1291. On Alessandro's death in 1304, Dante composed his second epistle (*Patruus vester Alexander*) to console Aghinolfo's sons.

Crema

The Lombard city of Crema, in the province of Cremona, is perhaps remembered chiefly because in 1159-1160 it held out for six months against a siege by Frederick I Barbarossa. In the nineteenth century, Italian nationalists used Crema as an example of civic resistance against tyranny and foreign domination. Images and stories from the siege of Crema—the *assedio di Crema*—entered into the culture of the emerging Italian nation-state, and the town became a symbol of the centuries-old tradition of resistance against the German Hohenstaufen and Hapsburg emperors.

Crema is also distinguished by the fact that as a new settlement—and unlike many other such settlements—it rapidly achieved a position of importance more characteristic of Lombard cities which had been inhabited since antiquity. The city's location in *Insula Fulcheri*, a wet but fertile zone between the Adda and Oglio rivers, made it an object of conflict from its earliest days. It was situated within the diocese and *contado* (hinterland) of Cremona, and at the intersection of several other powers: the considerable landholdings of the counts of Bergamo

or the Giselbertinger family; the growing area of influence of the Milanese families; and the area of authority of the counts of Canossa. Intensive land reclamation c. 1000 made this region increasingly attractive for farmers migrating from the northern Po Valley, and for feudal aristocrats from Lombardy. Crema's economic advantages explain its rapid growth. The settlement, mentioned first in documents from 1074, was quickly expanded and was fortified by a town wall built between 1082 and 1084. This *castrum* (fortified site) survived attacks in 1098 from the neighboring city of Cremona. The campaign of 1098 was probably connected to a privilege granted by Matilda of Canossa, in which she donated the rights of Insula Fulcheri to the church and Cremona.

Although it was a new entity, Crema had surprising military might. This was because it was settled by members of Lombard feudal aristocracy who organized themselves as a "republic of *milites* (Menant 1992). Crema oriented itself toward a system of stable alliances that divided the Po Valley into two camps: Milan and Piacenza on the one hand, and Cremona and Pavia on the other. Crema was a Milanese foothold in the diocese of Cremona and as such could depend on the support of Milan— Lombardy's main city—in resisting a siege by Emperor Lothar III in 1132 and an attack by Cremona in 1138.

During the first half of the twelfth century, Crema took on the characteristics of an autonomous city. For example, it acquired authority over the *contado*, and its citizens organized themselves into a commune under the leadership of consuls. However, it was not a bishopric, and so it was designated a *castrum* rather than a *civitas* throughout the medieval period.

Crema's close dependence on Milan had disastrous results in the 1150s, when Frederick Barbarossa attempted to strengthen his claim to the Italian sections of the empire and encountered resistance from the Milanese. In July 1159, Frederick's troops encircled Crema, as Milan's ally. This was the famous and brutal *assedio di Crema*, which resulted in the capture and destruction of Crema in January 1160. The emperor then handed Crema over to Cremona, with the provision that it was not to be refortified. His stricture effectively meant that Crema ceased to exist for the next twenty-five years. After the peace of Constance there was a change in alliances that prompted Frederick to allow Crema to be

rebuilt and fortified in 1185; however, the effects of the intervening quarter-century on the city's social and institutional continuity have not yet been studied.

After 1185, Crema shared much of its history with other northern Italian cities. Internal factions threatened to divide the citizens and repeatedly attempted to obtain support from Milan and Cremona. In 1338, Crema lost its autonomy to the Milanese state governed by the Visconti; it remained under the control of this state until the death of Gian Galeazzo Visconti in 1402. In 1449, Crema became a Venetian enclave in Lombardy. Eventually, in 1579, Crema gained its own bishopric.

Surviving from Crema's medieval period are the cathedral of Santa Maria Assunta and remains of the convents of San Domenico and Sant' Agostino.

Cremona

Cremona was founded on the banks of the Po River near its confluence with the Adda River. The city's strategic location in the center of the Po Valley, the great northern Italian plain, made it ideally suited for commercial traffic, which converged on it from every direction. Trade going north and south went along the Adda and the Oglio rivers, both of which flow from the foot of the Alps into the Po; trade going east and west moved along the Po itself, which crosses the northern plain and empties into the Adriatic. Cremona also lies near the most fertile agricultural land in the valley: the lowlands northwest of the city, known as *la bassa*. In the Middle Ages, this land was used for raising livestock, foodstuffs, and industrial crops.

The Romans established Cremona along with nearby Piacenza in 218 B.C. According to the Greek historian Polybius (c. 200-118 B.C.), the two cities were founded for strategic reasons: Piacenza on the south bank of the Po and Cremona on the north bank were frontier outposts, part of the Romans' defensive system against Hannibal in the second Punic war (218-201 B.C.). Cremona's inhabitants became citizens of Rome in 89 B.C. Little remains of the Roman period; it has been impossible, so far, to find traces of the temples, forums, arenas, theaters, and baths that the Romans built in their other major cities. However, a few intricate floor mosaics survive, suggesting that great wealth did exist in Cremona. Other than the mosaics, what can still be discerned is the Romans' rectangular arrangement of streets, with a *cardo* and *decumanus*. The sparse surviving literary evidence suggests that Roman Cremona developed a certain reputation for the quality of its schools: Virgil (70-19 B.C.) is said to have come to Cremona from his paternal home in Mantua to pursue his studies.

History and Municipal Institutions

Early Middle Ages (sixth-tenth centuries). Virtually nothing is known about Cremona during the fifth and sixth centuries, and historians continue to debate the extent of a Byzantine presence in the city during

the second half of the sixth century. However, it is known that in 603 Cremona was partially destroyed by the Lombards, whose control over northern Italy lasted until their final defeat at the hands of Charlemagne in 774. The Carolingian period witnessed the city's first economic revival since the fall of Rome. During the ninth century many of the major towns in the Po valley, including Cremona, grew in size, as trade with neighboring communities increased and as luxury goods brought from the east aboard Venetian ships reached the northern plain. Cremona, since it was on the Po River, was well positioned to serve as one of the most important entrepôts in the region.

Another factor contributing to the prominence of Cremona was its episcopal see. Cremona had a bishop as early as a.d. 451, if not earlier; and the bishop's power and prestige began to grow when the Carolingians granted bishops throughout their empire special responsibilities and privileges and turned over more and more political and economic power to the bishops. The Cremonese bishops received new lands and the power to collect revenues from people navigating the Po River, docking at the city's port, and entering the city, as well as from fishermen, grain millers, and people buying and selling at local markets. The bishops were also exempt from the feudal obligation to provide horses, wagons, food, and lodging to imperial troops or imperial officials passing through the city. The close tie between Cremona's bishops and the empire is exemplified by the most eminent figure of this early period, Bishop Liudprand (962-972), who was the author of several historical works and a trusted emissary of emperors Otto I and Otto II.

It should be noted that the citizens of Cremona were vexed by some of these developments, and particularly by the duties that all merchants, including local merchants, had to pay when docking at Cremona's port. In 924, the city's merchants attempted to avoid paying docking fees to the bishop by constructing their own port. To their dismay, however, the emperor intervened on behalf of the bishop and halted the project.

High and Late Middle Ages (eleventh century—1402). A significant development during this period was the rise and eventual fall of the commune (1098-1334). As early as the tenth century, as we have seen, Cremonese bishops came into conflict with the citizenry, who, although

they were not not yet politically organized, nonetheless demanded to be allowed to conduct their economic affairs peacefully and freely, without episcopal interference. The citizens first adopted more active, even violent, means against their overlord in the early eleventh century, when they drove Bishop Landulf (r. 1004-1030) from Cremona and laid waste to many of the episcopal buildings. They allowed Landulf's successor, Bishop Ubaldo (r. 1031-1073), to return, but they refused to pay him the customary taxes and tolls.

Cremona's commune developed slowly between 1030 and the end of the century. The commune first appears in a document of 1098, in which Countess Matilda of Canossa grants a piece of land to "the representatives of the church and of the commune." Matilda's reference to both church and commune indicates that the bishop still retained considerable power. The earliest organ of communal government was an assembly of all the citizens (*arengo*). How much actual authority the *arengo* exercised in the Italian communes is still unclear. In all

probability its power was greater in the early years, before the introduction of regularly elected consuls and other permanent institutions of government. The main purpose of the *arengo* was to deliberate on and ratify important matters of state. At Cremona, the *arengo* assembled either in the cathedral or in the public square just outside it. As communes began to develop permanent government offices, a primary responsibility of the *arengo* was to confirm the election of consuls. Cremona was among the earliest cities to elect consuls on a regular basis; the first extant record of Cremonese consuls dates from between 1112 and 1116. There is no apparent pattern in the number of consuls elected—two men were elected in 1130, seven in 1151, and ten in 1170—or in the length of their terms in office. Candidates for the office of consul were always selected from the city's oldest, wealthiest, and most powerful families. These families were so frequently at war with one another that in 1182 it became necessary to introduce a new executive office, the *podesta* (podesta, or city magistrate); but when this solution proved unsatisfactory, consuls and podestas took turns governing the city. Advising the consuls or the podestas were two small secret councils: the *sapienti* and the *consiglio del comune* (also known as the *consiglio di credenza*).

Between 1169 and 1187, the Cremonese expanded their walls, making the city four times larger than it had been and incorporating some suburbs. The incorporation of the suburbs brought new social and political tension, as the city became divided into two antagonistic camps. Within the *città vecchia*—the part of Cremona encircled by the ancient Roman walls—lived Cremona's oldest families: knights (*militi*), large property holders, judges, and merchants. In the *città nuova* lived the *popolo*: petty merchants, artisans, and small property owners. As in many other Italian communes, the *militi* and the *popolo* each created their own separate associations. By 1201, the *militi* of the *città vecchia* were organized into a *societas militum*, which included all those who performed military service on horseback for the commune, and, in 1292, this society built its own meeting place, the Loggia dei Militi.

The inhabitants of the *città nuova* tried repeatedly to gain acceptance as full citizens of the commune, arguing that, having been incorporated within the city's new walls, they had the right to participate in its government. Over time, as their requests for inclusion were repeatedly

denied by the residents of the *città vecchia*, the most powerful members of the *popolo* (merchants and perhaps also notaries and judges) began to assert their autonomy. In 1229, having produced their own statutes, they formed the *societas populi* (a military as well as a political body); thereafter, they elected their own officials, organized a separate government, refused to acknowledge the commune's jurisdiction, and, in 1256, began to construct their own headquarters, the Palazzo Cittanova.

As serious as these divisions were, it must be said that there were strong ties among members of the city's elite. Marriages between merchants and nobles were not infrequent; some wealthy commoners were members of the *societas militum*; and some nobles belonged to the *societas populi*. In the Italian city-states—in contrast to the situation in northern Europe—the distinction between aristocrat and plebian was not always sharp, and there was considerable social mobility.

The most famous and most beloved figure of the communal age was Bishop Sicardus (r. 1185-1215), who worked tirelessly to heal the city's divisions and to ensure that a third of the civic offices would be filled by members of the lower classes—the real *popolo*—so that the municipal government would not be dominated by the nobles and wealthy commoners who formed the two warring factions (*societas militum* and *societas populi*). A learned man, Sicardus was the author of a universal chronicle, a liturgical treatise, and a *summa* of canon law; and it is thanks to his efforts that the first layman who was not a noble, Homobonus Tucenghi (d.l 1197), was canonized by Innocent III in 1198.

In the course of the thirteenth century, the local dispute between the two Cremonese factions was absorbed into the larger conflict between the Guelfs and Ghibellines. Up to the mid-thirteenth century, the commune of Cremona was strongly proimperial. The empire not only protected and fostered the economic activities of the Cremonese but also served as an ally against Cremona's principal rival, Milan, Henry V's privilege of 1114 granted Cremonese merchants the right to navigate and trade freely along the Po River (from the Adriatic all the way east to Pavia) and throughout the entire kingdom of Italy. In 1155, Frederick I Barbarossa (r. 1155-1190) tried to punish Milan, which was defying him, by transferring its minting rights to Cremona. Relations between Frederick I and Cremona soured briefly in the middle of the century,

when the heavy hand of imperial rule provoked Cremona to side with the emperor's enemies in the formation of the first Lombard League (1167); but by 1176 Cremona was no longer participating in this anti-imperial alliance, and having made peace with the empire, it took no part in subsequent revivals of the league. In 1176, Frederick I pledged never to betray Cremona by negotiating peace with its foes, and he also promised to station imperial troops in Cremona whenever the city needed protection. During the reign of Frederick II (1215-1250), Cremona remained the emperor's steadfast ally against the Lombard League. Frederick II made Cremona his military headquarters and lived there during several periods. The honor of being the residence of the Holy Roman emperor and the advantages of having such a powerful ally should not, however, overshadow some of the less positive aspects of the relationship, notably the fact that the commune incurred large debts in supporting Frederick's military ventures.

Ghibelline rule continued from the death of Frederick II until 1266. During this time, Cremona was chosen as the capital of Uberto Pelavicino, vicar-general of all imperial lands in Lombardy. Originally elected *podestct* of Cremona, Pelavicino went on to establish Cremona's—and Italy's—first *signoria*. Now the Ghibelline capital of Lombardy, Cremona became a refuge for opponents of the church and for Cathar heretics from as far away as southern France. One incident from Pelavicino's rule illustrates how prominent a role religion played in the political life of the city. On hearing that a large group of flagellant penitents was approaching Cremona and Milan, Pelavicino had 600 gallows erected along the borders of his territory. This grim spectacle was meant as a warning to the flagellants not to proceed further. According to a contemporary chronicler (who was also a Ghibelline and hence sympathetic to Pelavicino), Pelavicino feared that the secret aim of these penitents was to incite the Cremonese to overthrow him. His harsh tactics worked: at the sight of the gallows, the flagellants retreated. Whether or not this chronicler was correct about the intentions of the flagellants, Pelavicino was certainly justified in fearing the worst from his religious opponents in general. When his downfall came, in 1266, it was at the hands of the papacy and its Guelf supporters. Pelavicino's immediate successor was, however, not a Guelf but another Ghibelline—Buoso da Dovara, the leader (*podesta*) of the

universitas mercatorum, or merchants' guild, and therefore a man who had the trust of the merchant class. Dovara, moreover, was acceptable to the church because, unlike Pelavicino, he did not openly tolerate suspected heretics.

Guelfs controlled Cremona from Dovara's deposition in 1275 until 1311, and in this new political and religious climate the commune reversed its former policy of tolerance toward heretics. Many local heretics were burned in Cremona, while French heretics were sent back to their own country in chains. To facilitate the work of the inquisitors and to ensure that Cremona would remain an ally of the papacy, the papal legate created a confraternity of laymen loyal to the Guelf cause, known as the *Consortio di Fede e di Pace* (Consortium of Faith and Peace).

The decade following 1311 witnessed continued violence between Cremona's Guelfs and Ghibellines. Not surprisingly, this internal turmoil encouraged outside powers to intervene. In quick succession Cremona succumbed to Galeazzo Visconti, duke of Milan (1322-1323), Emperor Lewis (Louis, Ludwig) the Bavarian (1328-1330), and King John of Bohemia (1331 — 1333). Finally, in 1334, Azzone Visconti conquered Cremona and annexed it to his Milanese state, and Cremona thus ceased to be an independent commune.

The demise of the commune did not, however, mean that all communal institutions disappeared. For administrative and fiscal purposes, medieval Cremona continued to be divided into four districts, each named after one of the city's oldest gates (*forte*). Each *porta* was composed of smaller neighborhoods, known as *vicinie*. Most *vicinie* were named after parish churches and encompassed only a street or two, but the largest *vicinie* were further divided into *quartieri*. During the communal period the system of *vicinie* reached its greatest extension, numbering sixty-five sometime before 1283. It has been estimated that Cremona had some 25,000 to 30,000 inhabitants, making it second only to Milan in wealth and population among the cities of Lombardy, and a natural target for an expansionist Milanese state.

From the fall of the commune in 1334 until 1402, Cremona was ruled by the Visconti of Milan, who introduced some immediate changes in its legal and administrative structure. In 1339, the city revised its statutes in accordance with the wishes of the Visconti. Further revisions

were made in 1349, 1356, and 1388, when not only the municipal statutes but also those of the merchant and artisan guilds were rewritten by order of the Visconti. The main thrust of these revised statutes was to preserve the Visconti's rule and to avoid the factional fighting that had plagued the commune. To those ends, the new statutes limited the communal liberties that the Cremonese had previously enjoyed, such as political autonomy, free and open assembly, and the right to bear arms. The statutes and other legislation emanating from Milan also promoted the economic agenda of the Visconti.

Economic Life

Although the revisions of Cremona's municipal statutes in the fourteenth century brought an end to the city's political independence, the effect of the Visconti on the city's economy appears to have been largely beneficial. In the municipal statutes of 1339, the Visconti offered financial incentives to anyone who would move to Cremona and help revitalize the city; and Cremona, now no longer at war with its most powerful neighbor and rival, became Milan's main port on the Po. A network of navigable canals and irrigation ditches built by order of the Visconti throughout their territory significantly improved agricultural production and facilitated transportation and communication. Cremonese merchants and artisans could now expect not only to profit from increasing local consumption and production but also to trade with the much larger Milanese market.

Throughout the Middle Ages the production of fustians constituted the leading industry in Cremona, although the manufacture of linen cloth and cotton and linen thread always remained important to its economy. Fustians were coarse cloths made of cotton only or of cotton with a linen warp; they were produced or purchased by the lower classes to make inexpensive winter clothing. The linen was grown locally, but the raw cotton was imported from Egypt. Unlike many neighboring cities in the Po Valley, Cremona never produced great quantities of woolen cloth.

In addition to being one of the greatest producers of cotton and linen cloth in Lombardy, medieval Cremona was also one of the area's

greatest commercial cities. Its central location on the Po River made it an ideal landing port for commodities destined either for local consumers or for reexport. In addition to cotton thread and Egyptian cotton, other bulk goods were imported or exported, including salt (from Venice) and flax (or linen) and foodstuffs from the surrounding countryside. Imported luxury items included raw silk, silk cloth, gold cloth, saffron, furs, and dyes. By the end of the twelfth century, merchants, bankers, and representatives of Cremona's artisan guilds had formed the *universitas mercatorum* mentioned above, an exclusive guild to protect their economic interests and ensure that the policies of the commune did them no harm. It is appropriate to note here that the city's patron saint, Homobonus, had been a Cremonese merchant.

Architecture

The heart of Cremona—its glory during the communal age— is the splendid complex of Romanesque and Gothic edifices bordering each side of the main square, the Piazza del Comune. These are all built of the red brick so typical of medieval Lombard architecture. The cathedral, originally designed as a Romanesque basilica, was begun in 1107 and was consecrated by Bishop Sicardus in 1190; Gothic transepts were added in the fourteenth century. The alternating bands of red and white marble on its facade make it one of the most striking cathedrals in Lombardy. To the right of the cathedral stands the Romanesque baptistery (1168), a massive octagonal building, also partially faced in red and white marble. To the left of the cathedral is the soaring Gothic Torrazzo, which was begun in the mid-thirteenth century; this is the tallest medieval bell tower in Italy. Facing the cathedral across the piazza is the Palazzo Comunale (1206), a visible sign of the commune's success in freeing itself from archiepiscopal rule. Between the baptistery and the commune's headquarters is the Gothic Loggia dei Militi (1292), which served as the meeting place of the *societas militum* and which, by virtue of its location in the main square, symbolized the prominence of the knightly class within the commune.

Crescentii Family

Several men whose name, Crescentius, appears in tenth- and eleventh-century documents from the vicinity of Rome are grouped together as a family, the Crescentii. As Toubert (1973) has indicated, the term Crescentii was not used by the medieval sources, and the "family" called by that name is a creation of modern historiography. But while the degree of consanguinity and of clan solidarity between the various Crescentii, or Cres-centiuses, has yet to be ascertained by scholars, there are clear lineage relationships between some of the most powerful men in and around Rome between 900 and 1050. These men shared policies as well as a name.

In modern studies the Crescentii are grouped into two main lineages: the Ottaviani and the Stefaniani. These names derive from the founders of the lineages. The Tusculani—who, like the Ottaviani and Stefaniani, were descended from the influential papal official Theophylact—competed with the Crescentii rather than cooperating with them. The Ottaviani tended to dominate the city of Rome, while the Stefaniani were formidable in the Sabine region. Several other Crescentii (the Stilluti, the Picti, and the Sandalarii) are named in charters and appear to have been lateral branches of the main lineages.

Although a Crescentius (whose relationship to the clan is uncertain) appeared at a trial in Rome in 901, the clan's apogee came in the last third of the tenth century. In that period the Crescentii produced one pope (John XIII, d. 972) and controlled most of the others; they held the

secular offices of Rome, and they exploited this combination to obtain lucrative donations from the papacy. Exerting influence on the popes and gaining territorial and jurisdictional concessions from them were an important part of the strategy of the clan; the counties of Terracina and Palestrina and the county and rectorate of Sabina were considered crucial. Even when a pope of non-Crescentian origin ruled, the Crescentii held on to the decisive secular offices in Rome. The Crescentian system depended on monopolizing Roman secular posts rather than the papacy itself and has been styled "Alberician" by Toubert. Despite direct interference by the Saxons in the workings of this system after 961, and despite a notorious period of repression under Otto III in 998 (when Crescentius Nomentanus made an unlucky stand at Castel Sant Angelo and was slain), the Crescentii maintained control until the virtually simultaneous deaths of "their" pope Sergius IV and the patrician John II in the spring of 1012.

The Crescentii also promoted the system of *incastellamento* in the second half of the tenth century. This involved creating population clusters in defensible locations which reinforced the hold of the Crescentii on the land and thus settled and augmented their agricultural income. Opportune marriages were another tool by which the Crescentii enlarged their spheres of influence, their territories, and their clientele.

The pontificate of the Tusculan Benedict VIII and his alliance with the Saxon Henry II began the dissolution of the Crescentian system. The Crescentii, deprived of influence over the popes and deprived of secular authority in Rome, fell back on their Sabine fastnesses. They proved unable to organize a comeback, and within a few years they had relinquished Palestrina and numerous Sabine castles to papal forces. The collapse of Crescentian power was not total or sudden, however, for a Crescentius was urban prefect (a judicial office) in Rome until at least 1017, and another held that post in 1032. The Stefaniani lost most in the fray with the Tusculani but fared quite well in the 1020s, to the extent that Abbot Hugh of Farfa was obliged to make a pact with the Ottaviani for protection from incursions by the Stefaniani. The Ottaviani used this pact to appropriate several Stefaniani strongholds in the Sabine hills and then refused to return them to Farfa. During this period, the solidarity of the clan reached a low point. The competition between the branches of the clan may even have contributed to the Crescentii's loss of power after 1012. Although Abbot Hugh protested vehemently against thefts and usurpations suffered by Farfa, throughout the eleventh century, land and fortified sites passed from the Crescentii to the monastery. A loss of political preeminence, underscored by the Crescentii's support of the unsuccessful antipopes Sylvester III (1045) and Benedict I (1058), accompanied the loss of property and jurisdiction. After 1058, the Crescentii were dormant politically, but they remained wealthy landowners in the Roman region as it was subsumed into the patrimony of the reformed papacy.

The Crescentii, including Crescentius Nomentanus, were opponents of foreign imperialism, but they were not ideologically motivated. Rather, they resented interference in Roman politics by German emperors because it often brought the advancement of rival local dynasts and the deposition of popes who favored the clan. As the "ins" when the Saxon rulers first intervened in Roman affairs, the Crescentii naturally resisted this innovation. Various "outs," the most successful of whom were the Tusculani, latched onto the German cause as a means of improving their fortunes in Rome. The Crescentii appear to have welcomed non-Italic interference in Rome, in its Byzantine form, when

this helped perpetuate their own power (that is, in the risings of 965, 974, and 984). The peculiarly Crescentian use of archaic titles (the patrician "of the Apostolic Lord," "of the Romans," or "of the Roman Senate"), and the continuation of the "senatorial" nomenclature of Alberic imply no desire cast off the barbarian yoke. The Crescentii used epitaphs, names, and dwellings inspired by ancient models as a signal of their allegiance to local traditions, the traditions of the city on which their ambitions were focused. Similar romanizing is detectable in Crescentius Nomentanus's scheme to drain the Pontine marshes, reviving a project which had been dear to the ancient emperors.

Charters referring to transactions by the Crescentii and place-names with Crescentian origins are found in Gregory of Catino (1883, 1888, 1892, and 1903), and in *Regesto Sublacense* (1887). Narratives (all hostile) in which various members of the family play prominent roles are found in Hugh of Farfa (1903).

Crime and Punishment

The relationship between crime and punishment changed over the course of the Middle Ages. In every system, the seriousness of the crime was related to the severity of the penalty, but during certain periods other factors were also taken into account.

In the early medieval Germanic system, the only important redress for crimes, including assault and murder, was compensation to the victims' kin. There was no concept that crime hurt society and the public sphere as well as the private parties; nor was there any concept that the state had a responsibility to protect society by repressing crime and punishing criminals. The Germanic system had a weak sense of definitive judgment, and the major aim of the system was conflict resolution—not punishment. Thus for even the most heinous and violent crimes, only pecuniary penalties were meted out.

During the early Germanic period, there were few public penalties; vengeance for crime was left to the offended party and did indeed take the form of a vendetta. As Germanic society became more settled, it enacted pecuniary penalties to compensate for giving up the right to take vengeance. This was an intermediate stage between state punishment and private punishment, in that the state regularized and

enforced private punishments, formulating scales of pecuniary penalties for various crimes. Germanic peoples also developed some idea of crime as disrupting society; to symbolize this concept, a certain portion of a compensation—that is, of a pecuniary penalty—was paid to the state. Actually, the proportion paid to the state as punishment for breaking the peace might be substantial: for instance, it was half the total compensation in the Lombard state, and a third in the Carolingian state. The pecuniary compensation to victims or their kin was called a *wergeld* and could be substituted for a blood feud: the victim or the family could retaliate themselves or accept the money. The compensation consisted of the capital or *manwyrð*, which restored the value of the victim; the *faida*, an equivalent sum to pay the offended party for giving up the right to retaliate; and the payment to the state. The amount of the compensation, or the punishment, usually depended on the crime, the status of the culprit, and the status of the victim. In the Lombard codes, pecuniary compensations were graduated so that a member of a lower class would pay less than a member of an upper class, proportional to income; but this was not the usual arrangement. Some classes of people were entitled to higher compensation for crimes committed against them; this was true, for example, of the clergy, although the Lombards did not give special protection to the clergy until the time of Liutprand (r. 712-744). To take another example, a state official, a *missus*, of Charlemagne was entitled to as much as nine times the normal *wergeld* of a free man. It should be noted that for some crimes, under Germanic codes, the culprit would be given in slavery to the offended family; and that offenders from the servile class received corporal rather than pecuniary penalties.

As Germanic tribes came into contact with Roman law, they became aware of the concepts of criminal intent and involuntary damage, and these concepts affected their scale of penalties. Rothari, as king of the Lombards (r. 636–652), had made no distinction between voluntary and involuntary homicide, but Liutprand, who came later, did make the distinction. Thus for involuntary murder the *wergeld* was still paid, but it did not include the *faida*. Also, under the ancient German rule of blame, an owner was completely responsible for acts of his animals. However, later Salic law stated, "When an animal kills a man and this fact is proved by witnesses, the master of the animal will pay half the

wergeld and will cede the animal for the other half," but "the master can rid himself of guilt and will pay nothing in the case where he was ignorant that his animal was into mischief."

Germanic society was reluctant to impose capital punishment or mutilation, because such penalties diminished the fighting force. However, according to Tacitus the Germans did punish treachery, desertion, cowardice, and sexual perversion with death.

The Christian concept of sin would eventually change the character of criminal law. Murders and rapes were no longer regarded as private wrongs that could be compensated for by giving money to the victims or their families; rather, such acts were considered sins requiring penance—that is, punishment. Saint Augustine believed that the state could use repressive measures to control the sinful nature of man and bring about a Christian society which would foster the efforts of individual Christians to perfect themselves. Christians did not need secular law, but the law should act against people who were predestined to be excluded from the heavenly city.

Christianity also brought new crimes, such as heresy and the practice of any other religion. Thus people caught talking to trees or fountains in the pagan way were punished; and bodies could no longer be burned but had to be interred. The banning of paganism did not put an end to superstition, from which Christianity itself was hardly immune. According to Salic law, "If a female witch has eaten a man and this can be proved, she will pay 200 *sous*." Often, if someone was suffering from an internal disease, a witch presumed to have eaten his insides would be sought. The church also influenced criminal law by making the penalties for rape, incest, and fornication very severe. In general, with the advent of Christianity, the people—who had once been considered the repository of customary law and thus a source of good—begin to be seen as a source of evil that needed to be molded so as to conform to a standard of goodness.

Despite the influence of Christianity, however, both the vendetta and compensation continued. The vendetta persisted in the Lombard and Lombard-Frankish states, because these states were not able to re-create Roman coercive mechanisms; and punishment remained half private in nature for a long time beyond the Germanic period. Even during the communal period, many serious crimes could be still compensated for

by monetary payments, and victims' kin could still execute the law to a significant degree. Conflict resolution remained an important part of the law. As late as the thirteenth century, under the statutes of communes, debtors were given to the creditor to work off their debts; in the Genoese statutes, not only debtors but also their sons were turned over to a creditor in this way. For cases of assault, "instruments of peace" were commonly allowed to take the place of, or quash, a public trial. In Florence, victims' kin continued to be involved in that these kin would decide who had been the captain, or main culprit, in a homicide committed by a group. Under both Roman law and Christianized German law, a husband could kill his adulterous wife and her lover on the spot (according to Roman law, adultery constituted a provocation to violence). The community was often called on to aid in the apprehension of criminals.

However, in the eleventh and twelfth centuries, with the advent of the communal state, Roman concepts of public crime— and of the state as responsible for suppressing crime—were revived. Crime came to be considered public because it offended society and disrupted the peace; the state came to be responsible for punishing public crime in order to protect society; and with the founding of communes in late medieval Italy, the state gained the power and the institutions to do this. In consequence, the nature of punishment began to change. The belief arose that gruesome penalties would deter crime; that such penalties were therefore necessary; and that in order to serve as a deterrent, a penalty had to be public. In the late medieval period, legal systems also operated under the principle that a penalty should not only suit the crime but demonstrate or symbolize the crime. Thus a woman who talked in public about unfeminine subjects or insulted someone might have her tongue cut out in a public piazza; and a thief might have his right hand cut off in the place where he had stolen and then be paraded through the streets with the severed hand chained around his neck. Sometimes social factors determined a punishment; for instance, decapitation was considered a more "noble" punishment than hanging, even though it was more certainly fatal. There was no concept that criminals could be reformed.

This philosophy of punishment led to bad situations—not surprisingly, we might now suppose, but in fact the results were

unanticipated at the time. For example, cutting off a thief's hand might make it impossible for him to work, so that he had no recourse but to persist in crime. Similarly, large numbers of people considered contumacious (roughly, in contempt of court, or fugitives from justice) were "banned": they were considered outside the law and could be killed by anyone. Banning swelled the number of professional highway robbers. Some criminals were branded or otherwise marked so as to warn others that they might be dealing with a dangerous person; this had the effect of making branded criminals unemployable and, again, gave them no other recourse than crime.

One factor that made such severe penalties acceptable was a changing attitude toward the poor. During the early Middle Ages, the attitude toward the poor had been benevolent, because the poor were considered necessary (as an object of charity) to help the rich get into heaven. In the later Middle Ages, however, the poor came to be demonized: in the new urban environments, rich and poor were in close proximity, and the poor were viewed as a threat—a criminal element to be suppressed. In Venice, poverty was sometimes equated with infamy.

Compensation became far less important as a penalty for crime. Most of the serious crimes now incurred corporal punishment, with smaller pecuniary penalties, if any. In Florence, the most serious crimes could still often be compensated for; but in Venice corporal punishment was the predominant form. In practice, when pecuniary compensation still existed, there was often a choice: those who could pay might avoid capital punishment or mutilation. For example, under a Florentine statute of 1295 homicide could be punished by a fine of 2,000 *libra* and six months in prison, or by decapitation. Families scrambled to come up with cash in time. As always, the poor were the most likely to be tortured and to receive corporal punishment. Also, the new concept of punishment as a deterrent led to more terrible corporal punishments, applied to an expanded range of crimes.

A great deal of ingenuity went into devising horrible and painful public punishments. Capital punishment could take the form of hanging (this was most common), suffocation in mud, drowning, decapitation, stoning, quartering, burning, or breaking the criminal on the wheel. Criminals could also be put into cages hung outside the palace of the *podesta*, where they were left to starve and decay in public view; or

they might be hanged from a wall of the palace, special trapdoors and platforms being installed for this purpose. Being drawn, hanged, and quartered was considered an especially ignominious death, intended not only to punish the culprit but also to make a deep impression on the viewer. The culprit was "killed" three times: first by being dragged by a horse, either on a pallet or without one (this depended on whether the court wanted him dead or alive for the next stage), then by being hanged, and finally by being cut to pieces. Such desecration of the culprit's body had a profound effect on medieval viewers religiously as well as psychologically, because they were accustomed to Christian burial in holy ground, accepted the doctrine of the resurrection of the body, and practiced prayers of intercession connecting the living with the dead. As we have noted, mutilation was another form of punishment: not only the hands but also the feet, ears, and nose might be chopped off, depending on the seriousness of the crime. Sometimes mutilation was in effect a death sentence, if the wound became infected.

"Publication" was achieved by public executions, by leading criminals to execution through the public streets, and by marching mutilated criminals through the piazzas. For defaulting and fleeing debtors, publication was done by painting their portraits on a wall—in Florence, on a wall of the Palazzo della Signoria or the Podestare.

In addition to corporal punishment, there were the ordeal and torture. Neither of these was actually a punishment (although that may have seemed a fine point to those being subjected to them); rather, both were parts of a defendant's trial. Torture was intended to elicit a confession; the outcome of an ordeal was considered proof. The main method of torture was *strappado*, or the rope hoist, which was also used at times as a punishment. The defendant's hands were tied behind his back up above his head and then to a rope hoist, by which he was lifted into the air. To intensify the pain and dislocate the joints, the rope was jerked a specified number of times.

Some penalties for less severe crimes were meant merely to shame. For example, prostitutes might be chased through a town nude. Some people were put into stocks in the middle of town, sometimes with their tongues in a *giova*, where they could be degraded and ridiculed by their compatriots. People who had broken the Lenten fast by eating meat

might be paraded around town with a ham strung around their neck. Heretics would be marched around wearing a miter on the head. Community chastisement was apparently also considered an effective deterrent.

For all the serious public crimes, an accompanying penalty was the status of "infamy." The infamous were not eligible for political office and could not bring an accusation or give testimony in court. Infamy counted as a presumption against a person charged with a crime. Another common penalty involving status was "banning." This was applied when a person accused of a serious crime was deemed contumacious—i.e., in contempt of court or a fugitive from justice—despite repeated citations and grace periods. (Infamy did not apply to people condemned through contumacy.) When a person was held to be contumacious and banned, he was considered to have confessed to the crime and thus to have been condemned. He was then declared outside the law, was said to be "wearing the head of the wolf," and could be killed with impunity by anyone.

Contumacy posed a grave problem for medieval judicial systems. Innocent and guilty defendants alike fled from a judicial system in which they were likely to be tortured or put to an ordeal during the proof stage; as a result, the contumacy rate in Florence was 58 percent during the years 1352-1355, and 56 percent in 1380-1383. By the time of the Renaissance, this problem was so acute that a sort of bounty or amnesty system arose: one banned criminal who captured and brought in others would be excused from his own penalty. This measure appears to have encouraged crime.

Forms of exile were also imposed on criminals. Relegation involved sending a criminal to a certain part of the state or to another state where he was expected to stay and check in regularly with the authorities. Relegation was used to prevent a vendetta by separating a man from his enemies; in the communes, it was used to avoid insurrections by separating a magnate from the rest of his family (*consorteria*), with whom he had engaged in lawless behavior. Another form of exile, deportation, was possible only for cities, like Venice and Genoa, that had overseas possessions.

During the late Middle Ages, prisons were intended not as places of punishment but rather as places of detention for people awaiting trial

and for criminals who could not pay their fines. However, prison apparently came to be considered in effect a penalty in itself, because after a culprit had been in prison for a long time without paying his fine, he was considered to have suffered enough and would be released. Prisons became deliberate places of punishment in the ecclesiastical court system before they were so used in secular systems. But the idea of reforming or retraining people in prison was not conceived until centuries later, in the workhouse movement.

Prisoners were not maintained at public expense; the cost of keeping them in prison was expected to be borne by their families, although sometimes religious confraternities came to the aid of prisoners. In a prison, amenities could be purchased from the guards or supervisors—a system that led to considerable corruption and extortion. Such amenities included lighter chains, better food, illumination, windows, visitors, and the privilege of wandering about the prison. On religious holidays, certain people who had been imprisoned for a long time were released as an offering to God, or oblation.

In the nascent communes, a disproportionate amount of crime was committed by violent prepotent nobles, who saw themselves as above the law and were thus a threat to safety within the commune as well as to its political stability. The communes forbade these nobles to ride through the town with armed retainers or to congregate at the houses of important magnates. The poor were exposed to greater temptations in the new commercial cities, and for the sake of social control severe laws were enacted against theft; an example is the Venetian *promissio*. Temptation was especially strong in the putting-out system, whereby expensive fabrics were left in the hands of lower class cloth workers.

Certain crimes were particularly prevalent or were taken especially seriously. In Florence during the fourteenth century, the most common crime was assault (one-fourth to one-third of all condemnations were for assault); the next most common crime was theft. During the fifteenth century in Florence, the leading crimes for which people were executed were theft, homicide, theft and homicide together, counterfeiting, rape, sodomy, arson, and treason. The most serious crimes in Siena during the thirteenth and fourteenth centuries were homicide, treason, arson, kidnapping, rape, poisoning, mutilation, torture, highway robbery, perjury, wounding and drawing blood, and

breaking into a home for purposes of theft. Highway robbers, professional criminals, and recidivists of any kind were punished very severely. Sodomy was often punished severely in the communes; the accuser would be a warded part of the fine; and even suspicion of sodomy was sometimes sufficient for a condemnation. The crimes for which torture could be applied in Florence during the late medieval period were robbery by a habitual thief, robbery at night, falsification, fraud, arson, devastation at night (usually, this meant destruction of crops), kidnapping, transmitting letters to the enemy, and homicide.

Crusades

The crusades were a centuries-long series of military-religious expeditions, beginning in 1095, in which Europeans attacked the enemies of western Christendom and attempted to establish Christian outposts on Europe's frontiers. The expeditions were proclaimed by, although seldom under direct control of, the papacy and served in part as instruments of papal foreign policy. Although the crusades were originally directed at securing control of the sacred shrines in the Levant, crusades were soon proclaimed against other targets as well: they were used to attack Muslims in Spain and North Africa, pagans and Russian Orthodox Christians in the Baltic, Christian heretics and other opponents of the papacy in western Europe itself, and the indigenous peoples of the Americas. Successful crusades often resulted in the establishment of colonies of western settlers in the conquered regions and served as instruments for the expansion of Christendom into numerous regions of the non-European world.

Crusades in the Near East

The First Crusade, proclaimed in 1095 by Pope Urban II, was the most successful of all these expeditions and set a pattern that later generations attempted to emulate. French knights, noblemen, and common folk predominated in this expedition. Notable Italian participants included Prince Bohemond of Taranto, son of Robert Guiscard; Bohemond's nephew, Tancred; and a small band of followers from southern Italy and Sicily, who figured prominently both in the military engagements and in the political intrigues of the crusading forces. In addition, merchant ships and crews from Genoa joined the crusaders at Jaffa and played a crucial role in the final assault on Jerusalem, which culminated in the capture of the holy city by the crusading army on 15 July 1099. A Pisan fleet, commanded by the papal

legate, Bishop Daimbert of Pisa, also participated in the last phases of the First Crusade.

Both the Genoese and the Pisans quickly planted commercial colonies in the coastal cities of the Levant in the aftermath of the First Crusade, and Italian merchants soon became and long remained a vital element in the Latin states that crusading armies organized to control conquered territories. During the two centuries of Latin settlement on the mainland of Syria and Palestine, from 1099 to 1292, Italian merchants profited from and contributed heavily to the stability and economic viability of the crusading states.

After the resounding victories of the 1st Crusade, the rulers of the Latin states in the east faced the major challenge of finding and retaining sufficient military manpower to control their new conquests and to establish defensible frontiers against potential Muslim foes, who surrounded and vastly outnumbered them. An early attempt to bolster the defenses was made by Archbishop Anselm of Milan, who in 1100 recruited a substantial army of Lombard troops to reinforce the garrisons that the First Crusade had established in the east. With ample financial resources, drawn largely from a subsidy collected from the clergy of Lombardy, Anselm and his forces marched overland to Constantinople, where they were joined by further military contingents from French- and German-speaking lands in the spring of 1101. The large and well-equipped crusade of 1101 ended in disaster, however, when its forces were ambushed and virtually annihilated by the Seljuk Turks in eastern Anatolia. A small fraction of the army survived, but only a handful of these survivors ever reached the Holy Land.

The success of the First Crusade and of the initial stages in the formation of western colonies in the near east resulted in large part from the inability of the Muslims to unite in opposition to the western invaders. That situation began to change in the mid-twelfth century, especially after the rulers of Aleppo succeeded in bringing neighboring Muslim states under their control. Under the *atabeg* Zengi (d. 1146) and his successors, Nur ad-Din (d. 1174) and Salahad-Din ibn Ayyub (or Saladin, as westerners commonly called him; 1137 or 1138-1193), the Muslim states of the region slowly, grudgingly united and began to put increasing military pressure on the Latin outposts. In 1144 Zengi captured Edessa, the easternmost outpost of Latin expansion.

Pope Eugenius II (1145-1153) responded to the call for Edessa by summoning the rulers and noblemen of Europe to a major new crusade, one that would not only attack Christendom's enemies in the Middle East but also push the frontiers of Christendom outward against other foes. The pope also called on Europe's warriors to take the field against the Muslim rulers of Spain and Portugal and against Slavic pagans on Germany's eastern frontiers, as well as against the Zengid princes of Aleppo, the Seljuk Turks in Anatolia, and the Fatimid caliphs of Egypt. Saint Bernard of Clairvaux, whom the pope entrusted with primary responsibility for recruiting the forces to implement this grand design, was able to raise substantial armies from northern Europe, but he spent little effort on recruitment south of the Alps. Although Genoese and Pisan fleets joined the attacks on Spanish and Portuguese targets, Italy's participation in the middle eastern campaigns of this crusade was extremely modest. In any event, the massive western armies that eventually reached the east were plagued by dissension, disaster, and defeat; and all the effort expended to mount the expedition produced negligible improvement in the situation of the Latin outposts of the Levant.

In consequence of the failure of the crusade of 1147-1148, Nurad-Din, who had succeeded Zengi, was able to continue the process of political and military consolidation that gradually drew a noose around the remaining Latin states in Syria and Palestine. Toward the end of his life, Nur ad-Din's armies succeeded in occupying Egypt and displacing its Shiite rulers with a Sunni government dependent on him. When Saladin succeeded Nur ad-Din in 1174, the links that bound Egypt to Aleppo and Mosul were tightened ever more firmly; they were still further clinched when Saladin occupied Damascus and incorporated its territories into his empire. At this point Saladin's domains pressed against the Latin states on three sides, while his control of the formidable navy that the Fatimids had built gave him a major presence at sea as well. The threat of an attack by the Muslims on the Latin states became a grim reality in 1187. The campaigns of that year resulted in the Muslims' reoccupation not only of Jerusalem but also of nearly all the other cities that the Latins had held since the First Crusade. The Latin states were very nearly wiped out in one season's campaigning; they retained control only of Antioch and Tyre on the Levantine coast

and a few castles scattered through the interior.

In reaction to this catastrophic reversal, Pope Gregory VIII called for a new crusade. The response to the pope's appeal was impressive. Both the English king, Richard I (the Lion-Hearted), and the French king, Philip Augustus, took the cross, and so also did the German emperor Frederick I Barbarossa. Frederick was the first to embark on the crusade, accompanied by a powerful force, in May 1189, but on 10 June 1190 he accidentally drowned while campaigning in Asia Minor; the greater part of his army subsequently returned to Europe without ever reaching the Holy Land. The French and English kings departed by sea for the east on 4 July 1190, landed at the strategic port of Acre, and after a long siege captured it on 12 July 1191. Shortly thereafter Philip Augustus returned to France, leaving the English king, Richard, in command of the remaining crusaders. Further campaigns in 1191 — 1192 resulted in the reestablishment of a Latin kingdom on a much reduced scale along the Levantine coast, before Richard's departure for the west on 9 October 1192.

Although thirteenth-century popes proclaimed numerous crusades, none of them secured the broad popular response that had greeted the First Crusade and the subsequent expeditions in the twelfth century. The crusade of 1202-1204, in which the Venetians played a leading role, resulted in the conquest of Constantinople and the establishment of a short-lived Latin empire, which for a few decades supplanted Byzantine rule in much of Greece. In 1261, however, a Byzantine army reoccupied Constantinople, and the Latin empire soon disappeared altogether. Another crusade in 1217-1219 gained a foothold in the Nile delta and threatened to march on Cairo before Egyptian forces rallied and drove the crusaders out. The crusade of Frederick II, king of the Two Sicilies as well as German emperor, in 1227-1229, regained control of Jerusalem and held it for a decade, until it surrendered to the Ayubids in 1239. The crusade of the French king Louis IX in 1248-1254 once more attempted to gain control of lower Egypt, but after some initial successes Louis was forced to abandon the footholds he had secured.

The following three decades saw a steady erosion of the Latin states in Syria and Palestine in the face of attacks by the Mamluks. Acre, the last major city in Latin hands, surrendered to the Mamluks on 18 May 1291, and the remaining strongholds fell within the next three months.

The crusaders retreated to Cyprus and later established strongholds on Rhodes and Malta, but never again did they successfully reoccupy positions on the Palestinian mainland.

Through all these military triumphs and reverses, Italian merchants constituted a mainstay of the crusading settlements in the east. The growing trade in oriental luxury goods—especially spices, aromatics, dyes, and fabrics—was firmly in the grasp of the merchant colonies that had been established in the crusader states by cities such as Genoa, Pisa, and Venice. The Levantine colonies also gave Italian entrepreneurs access to profitable eastern markets for European manufactures, notably woolen and linen cloth, as well as furs, timber, and iron. The fall of the Latin states in Syria and Palestine put a temporary crimp in this commercial activity, and successive popes attempted to embargo direct trade between the Italian cities and the Muslim merchants with whom they had established relations during the heyday of the crusader states. The merchant cities soon adapted to the new situation, however, and found ways around the ban. The loss of the crusader states brought new risks and expenses to commercial life but failed to halt the lively trade with the east that the success of the early crusades had done so much to promote and that had brought extraordinary prosperity to successful Italian entrepreneurs.

Daddi, Bernardo

The Florentine Bernardo Daddi (fl. c. 1320-1348), "an artist of rare and exquisite gifts" (Offner and Steinweg, 1930-1947), may have been trained in Giotto's workshop. Daddi's early panels, such as the triptych from the church of Ognissanti in Florence (signed and dated 1328), are strongly influenced by Giotto; but as Daddi matured, he began to diverge from Giotto's weighty forms and developed a style that united the Florentine heritage with the Sienese affinity for graceful figures, decorative settings, and more spontaneous interactions between the Madonna and child. The large number of panels executed in a Daddesque idiom indicates that Daddi himself had a large and productive workshop in Florence.

In his best works—such as the San Pancrazio Polyptych (c. 1340), now thought to have been commissioned for the cathedral of Florence; and the Madonna and Child of the Berenson Collection (Florence, I Tatti, c. 1340)—Daddi's figures are imbued with emotional tenderness and grace, in contrast to Giotto's more massive and somber mode of expression. The intimacy between the Madonna and child is characteristic of Daddi and his school; often, the Madonna holds up an index finger to present the child with a bird or a flower, or in some examples to admonish him.

Daddi appears to have been partly responsible for the popularization of the triptych in Florence. The portable hinged triptych, derived from Byzantine prototypes, could be closed to protect the image and opened for times of private devotion. During the 1320s and 1330s, painters including Daddi and Taddeo Gaddi developed a Gothic format for the panel type. Daddi's Bigallo Triptych (dated 1333, although the last digits have been repainted), a relatively large and richly decorated example that is closely related to a similar triptych by Taddeo Gaddi (1334, now in Berlin), may have been intended as a votive offering.

Daddi had close stylistic affinities to painters of the "miniaturist tendency" such as the Saint Cecilia Master, and his intimate, lyrical style was best suited to works on a small scale. The only frescoes attributed to him are those depicting the martyrdom of saints Lawrence and Stephen in the Pulci-Berardi Chapel of Santa Croce in Florence (c. 1330). A Madonna and Child with Angels painted for the confraternity of Or San Michele in 1347 was meant to recall a miracle-working image of the *Duecento* that had previously been in Or San Michele. Daddi's panel, which was eventually set into Andrea Orcagna's imposing marble tabernacle (1357), attracted many survivors of the plague and accelerated the transformation of Or San Michele from a granary into a church. The Gambier-Parry Polyptych (signed and dated 1348), with its

pronounced compression of space and form, provides further evidence that by midcentury Daddi had moved away from the spacious monumentality of the Giottesque tradition.

Like many other artists of his time, Daddi died during the black death of 1348.

Damian, Peter

Peter Damian (1007-1072) was a leading advocate of church reform. According to his biographer, John of Lodi, he was born in Ravenna to a family which was respectable but had many mouths to feed. Fearing that one more heir would deplete the inheritance of all, his mother

refused to suckle him. When he was black and nearly dead with hunger and cold, a priest's concubine took him and restored him to health. Other adversities followed, though. Orphaned early in childhood, Peter was left to the care of a married brother; the brother and his wife subjected the boy to extreme privation, lodging him with the swine. From this wretchedness he was rescued by a second brother, Damian, who cared for him with fatherly affection and saw that he was carefully educated in the liberal arts. Peter took this brother's name, Damian, in gratitude.

Peter Damian's studies took him to Faenza and Parma. For a short time, he taught rhetoric in Ravenna. But when celebrity and wealth seemed within his grasp, a disposition to austerity, acquired through the harsh experiences of his childhood, asserted itself. He took monastic vows in the eremitic community of the Holy Cross, at Fonte Avellana, later the nucleus of the order of Camaldoli.

For Damian, the term "spiritual militia" was not metaphorical. He practiced asceticism militantly, always fighting against unseen evils by voluntarily subjecting himself to mortifications, by zealously expanding the physical resources of the community when he became prior of Fonte Avellana (after 1043), by encouraging the foundation of daughter houses, and by preaching. His earliest treatises, which date from this period, express a combination of intellectual and rhetorical brilliance with merciless zeal that remained his signature: these were *Counterblast against the Jews* and a *Life of Saint Romuald*, the founder of Fonte Avellana.

As a deeply learned, resourceful, and tireless advocate of reform, Peter Damian was taken into the circles of the Emperor Henry III and of others who wished to bring about the reform of the whole church from the head down, beginning with the papacy. He attended the synod of Sutri (1046), at which three papal claimants were removed and a new pope was installed; he also attended reform synods held by popes Clement II and Leo IX. For Leo IX, Damian wrote his first major treatise, the *Book of Gomorrah*, against forbidden sexual practices among the clergy, including homosexuality.

Although Damian was always reluctant to leave the rigors of monastic life, he was forced by Pope Stephen IX to enter the college of cardinals, as bishop of Ostia (perhaps in 1057). He then became a

fervent advocate of papal primacy, which he enforced in an important legation that he undertook to settle disputes in the church of Milan (1059), subordinating the alleged privileges of that church to Roman norms. In support of the pope's universal powers, he encouraged the making of an early collection of canonistic texts. Yet among reformers he was a moderate, as he showed in his conciliatory attitude toward the imperial court and in his treatise *Liber gratissimus*, in which— contrary to the opinion of Cardinal Humbert of Silva Candida— he defended the validity of sacraments performed by clergy who had committed simony or lived in concubinage.

In 1067, after making several requests, Damian was allowed to abdicate his bishopric and return to Fonte Avellana. Throughout his career, he had continued to practice spiritual devotions, instituting liturgies in honor of Christ's passion and of the Virgin Mary, attending to the needs of the poor, and inflicting on himself every rigor of spiritual warfare, including hairshirts and flagellation.

In the last years of his life, the papacy called him from monastic retirement for other diplomatic missions: to Florence (1066-1067), to

adjudge charges of simony against the archbishop; to Frankfurt (1069), to persuade King Henry IV to abandon an intended divorce; and to Ravenna (1072), to release the city and its bishop from an excommunication they had incurred through adherence to the antipope Honorius II (Cadalus of Parma). Returning from Ravenna, Damian died in the monastery of Santa Maria foris Portam in Faenza.

The exceptional range of Peter Damian's learning and achievement is plain in the large body of his extant writings. These include 180 letters (some of which are actually treatises on ascetic and mystical theology) and about fifty sermons, as well as legal briefs and devotional works such as prayers, hymns, and accounts of the deeds of saints.

Miracles had been ascribed to Peter Damian during his lifetime, and from the moment of his death he was venerated as a saint. In 1828, he was proclaimed a doctor of the church.

Dandolo Family

The important Dandolo family of Venice produced four doges: Enrico (r. 1192-1205), Giovanni (r. 1280-1289), Francesco (r. 1329—1339), and Andrea (r. 1343—1354). These doges led Venice's territorial expansion,

codified its laws, and struck new Venetian coins. Among the many Dandolo who served Venice, a second Enrico was patriarch of Grado (1129-1188), and the third Enrico completed an influential Venetian chronicle in the vernacular c. 1362. The Dandolo were most powerful before 1380; they contended with the Tiepolo for leadership in Venice.

Enrico Dandolo, the doge of the Fourth Crusade, was elderly and blind when he was elected in 1192. Earlier, he had been ambassador to Constantinople and an organizer of the Great Council of Venice in 1172; as doge, he made peace with Verona and issued two new silver coins—the *grosso* and the *quartarolo*. He was instrumental in leading Venice to agree to transport the crusaders on the Fourth Crusade. When the crusaders could not completely pay for their transportation, they assisted Venice in recovering its rebellious Croatian colony, Zara. Thereupon, they redirected their voyage to Constantinople to depose a Greek emperor in return for help from the Byzantines. The ninety-year-old doge led the assault on Constantinople by sea, personally scaling a ship's ladder up the city walls. When the new Byzantine emperor proved false, the crusaders and Venetians reconquered and sacked the city in May 1204 and divided the booty. They chose Baldwin of Flanders rather than Dandolo as Latin emperor of Constantinople and determined that the Latin patriarch of Constantinople should be Venetian. In 1205, they agreed to partition the Byzantine lands. The Venetians under Enrico Dandolo thus began acquiring an overseas empire. Venice placed the four horses from the Hippodrome in Constantinople, a prize of conquest, on the facade of San Marco. Enrico died in the east and was buried in Hagia Sophia. Meanwhile, Ranieri Dandolo, Enrico's son and vice-doge in Venice, directed the first codification of Venetian civil law. Ranieri later died in the Venetian conquest of Crete.

Giovanni Dandolo, Enrico's great-grandson, doge from 1280 to 1289, extended Venetian influence on the Adriatic and joined with Charles of Anjou in planning another crusade against Byzantium. However, the crusade evaporated with the war of the Sicilian Vespers. Like Enrico, Giovanni struck a new coin, the gold ducat, or *zecchino*, which continued to be issued at approximately the same weight and fineness from 1284 to 1797. Giovanni also began to collect the deliberations of the Great Council. During his reign, in 1285, Venice was devastated by

disastrous earthquakes and destructive flooding. His son Andrea commanded the Venetian fleet at the battle of Curzola in 1298 and committed suicide after being captured by the victorious Genoese.

Francesco Dandolo, doge from 1329 to 1339, began Venice's expansion on the mainland. As the Venetian ambassador to Avignon in 1313 before becoming doge, he had persuaded Pope Clement V to lift an interdict imposed during Venice's war with Ferrara. According to legend, Dandolo chained himself under the pope's table—thereby earning the nickname Francesco il Cane ("the dog")—until Clement V promised to relent. While he was doge, Venice joined a coalition against the eastward expansion of Mastino della Scala, lord of Verona. After Mastino's defeat Venice gained Treviso. Francesco Dandolo also issued new coins, the base silver *soldino* and *mezzanino*.

Four years after Francesco's death, the Venetians chose as doge his distant relative Andrea Dandolo, then age thirty-seven, who was a legislator and Latin scholar. Andrea held office from 1343 to 1354. His friend Petrarch characterized him as "good, noble, patriotic, intelligent, well-bred, eloquent, and refined." Andrea wrote two of Venice's most authoritative Latin chronicles and a practical legal manual. He also codified a book of Venetian civil law, supplementing the five books codified a century earlier, and collected Venice's foreign treaties in *Liber albus* and *Liber blancus*. In the basilica of San Marco, Andrea renovated the Pala d'Oro and constructed the chapel of Sant' Isidoro. Like the previous Dandolo doges, he issued new coinage—a finer *soldino* coin for domestic use and a *tornesello* coin for Venetian dependencies in Greece. These positive achievements were made, however, at a time when Venice was suffering several calamities. In 1345, a severe famine caused Venice to send state galleys to Sicily and Constantinople to buy grain. In January 1347, a devastating earthquake rocked the city. In 1348, the black death swept through Venice, killing about half of the population. The war with Genoa was resumed; Venetian fleets, encouraged by Aragon and by England, battled the Genoese throughout the Mediterranean. Andrea Dandolo died on 2 September 1354, when news came that Venice had suffered a disastrous defeat at Portolongo, in Greek waters. He was the last Dandolo doge, and the last doge to be buried in San Marco, resting in his chapel of Sant' Isidoro.

Dante Alighieri

The *Divine Comedy* or *Divina commedia* of Dante (Dante Alighieri, 1265-1321) is a classic of western literature. Generations of readers have valued it as much for continuing and transforming the epic tradition of Homer's *Iliad* and *Odyssey* and Virgil's *Aeneid* as for initiating the Renaissance tradition of the long poem. From Dante's poem to Milton's *Paradise Lost* unrolled a single cycle of European literature that fused the forms and structures of the classical epic, the theology and religious passion of Christian belief, and the forces of contemporary experience in stunning poetic achievements.

Because Dante's great poem became recognized a classic, it continued to enter into the lives of readers even when the epic cycle that it had helped initiate lost impetus and was replaced by other forms of literary expression. In fact, Dante's *Divine Comedy* has the kind of power and appeal unique to a classic: successive eras have found reflected in it their own intellectual concerns; and just as a river takes on the coloration of the many terrains through which it passes, so Dante's poem has accumulated the tones of many successive readings.

Yet although Dante has become, as Ben Jonson said of Shakespeare, a figure for all time, he was still of a time. The *Divine Comedy* may have taken on the attributes of a living, growing organism, but it was nevertheless a product of medieval Italian culture. This masterpiece needs to be considered in light of the evolution of Dante's own poetic practice and theory, his attitude toward the newly emergent Italian language, his own acquisition of scholastic philosophy, the new

mediating role of the lay philosopher, the vicissitudes of Dante's own political career both within and outside his native Florence, and the crucial changes in the large public forces that fashioned Dante's own life and times and the Italian culture of his day.

One factor that makes this larger frame so necessary is Dante's own nature and temperament—his willing engagement with the most powerful forces of his time. Although in the *Divine Comedy* he chastises himself for heedlessness, he makes the dominant historical events of his day and the major elements of his culture not the background but the foreground of his poem: in fact, its very substance. Like many of the poets who would follow him over the next three centuries, Dante himself was a considerable public figure.

Dante was born, as he tells us, under the sign of Gemini (21 May-20 June). He passed his youth in an ascendant, triumphant Guelf Florence, which, in league with the papacy and France, had finally, after nearly fifty years of intermittent strife, succeeded in defeating and permanently banishing the Guelfs' adversaries, the Ghibellines. As a young man Dante was a loyal son of the commune, imbued with the civic humanism of Brunetto Latini, who after his return from exile in 1266 became the spiritual mentor of an entire generation of young Florentines. In two instances in the *Commedia*, Dante personally recalls battles fought by the Florentine commune at Campaldino and Caprona, indicating that he himself was present. In many respects Dante belonged to a *jeunesse dorée*, a group of golden youths—as he indicates, for example, in *Paradiso* 8, when he records the favor shown to him by Charles Martel when Charles made a princely entrance into Florence. At age eighteen, already possessed of remarkable self-confidence, Dante sent his first poem to the most famous writers of the day, including Guido Cavalcanti.

Early in the 1290s, Dante collected the poems, mostly sonnets, that he had been writing over the preceding decade and brought them out as a little book (*libello*) that was to become famous: *Vita nuova* (*The New Life*). Here he made his first gesture toward a lifelong endeavor that itself would undergo some twists and turns, praise of the lady Beatrice. *Vita nuova* contains forty-two brief chapters with commentaries on twenty-five sonnets, one *ballata*, and four *canzoni*; a fifth *canzone* is left dramatically interrupted by Beatrice's death. The prose commentary

provides the framing story, which does not emerge from the poems themselves. The story is simple enough: Dante's first sight of Beatrice when they both are nine years old; her salutation when they are eighteen; Dante's subterfuges to conceal his love for her; the crisis he experiences when Beatrice withholds her greeting; his anguish at the thought that she is making light of him; his determination to rise above anguish and sing only of his lady's virtues; his experiences that anticipate her death (a young friend dies, Beatrice's father dies, and Dante has a premonitory dream); and finally the death of Beatrice, Dante's mourning, his temptation by a sympathetic *donna gentile* (a young woman who temporarily replaces Beatrice), Beatrice's final triumph and apotheosis, and in the last chapter Dante's determination to write at some later time about her "that which has never been written of any woman." Beatrice thus became one of the most famous unknowns in history.

It was in accordance with the opinion of Guido Cavalcanti that Dante had decided to write *Vita nuova* in Italian; therefore, he dedicates it to his "first friend," whose brilliant and haughty spirit he memorializes most adroitly in *Inferno* 10. A second contemporary figure who influenced Dante was Guido Guiniz-zelli, the poet most responsible for altering the prevailing local, or "municipal," poetry. Guido's poems were written in praise of his lady and of *gentilezza* (nobility), the virtue that she brought out in her admirer. The concept of

love that Guido extolled was part of a refined and noble sense of life; and his influence was responsible for the poetic and spiritual turning point of *Vita nuova*. In chapters 17–21, Dante experiences a change of heart, and rather than write poems of anguish he determines to write poems in praise of his own lady, especially the *canzone* *Donne ch'avete intelletto d'amore* ("Ladies who have understanding of love"). This *canzone* is followed immediately by the sonnet *Amore e 'l cor gentil sono una cosa* ("Love and the noble heart are the same thing"), in which the first line is clearly an adaptation of Guinizzelli's *Al cor gentil ripara sempre amore* ("In every noble heart love finds its home"). This was the beginning of Dante's association with a new poetic style, the *dolce stil nuovo* ("sweet new style"). He dramatically explains the significance of this style—the simple means by which it transcended the narrow range of more regional poetry—in Canto 24 of the *Purgatorio*.

Another significant change was Dante's more active involvement in the political affairs of the commune. As a philosopher, Dante was eligible to join one of the guilds that constituted the main entry into Florentine political life, and in 1295 he became a member of the guild of physicians and apothecaries. This was a perilous time, as the triumphant Guelfs had fallen into vehement strife among themselves;

thus in *Inferno* 6, Dante refers to the *città partita*, the divided city. Later, Dante was forced to recognize, bitterly, that the antagonism between Guelfs and Ghibellines had been replicated in the division within the Guelfs. This factionalism gave birth to the Black Guelf party, which was more or less intent on imposing severe restrictions on the defeated aristocrats; and the White Guelfs, who were more conciliatory. Dante was elected prior in the fateful bimester (two-month period) of 1300, and he became an active opponent of intrusions by the papacy in communal matters. These political activities heralded a significant change: Dante was gradually becoming opposed to the basis of Florentine hegemony, the alliance among the Guelf party, the papacy, and France. In time, he would oppose all three; in fact, in his later political prose work and in the *Commedia* his voice expresses a lofty, if qualified, Ghibel-line—that is, imperial—idealism.

DANTIS
ALIGHERII
FLORENTINI
MONARCHIA.

COLONIÆ ALLOBROGUM,
Apud HENR. ALBERT. GOSSE & SOCⁱ

MDCCXL

Henryson

Dantis Aligherii florentini Monarchia. Coloniae Allobrogum, apud H. A. Gosse, 1740. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

The alliance of the Black Guelfs with the papacy and France, the alliance that had been responsible for the defeat of the Ghi-bellines a generation earlier, effectively became a deceitful conspiracy responsible for the ejection of the White Guelfs from Florence. Thus in 1302, Dante himself became an exile. The course of his peregrinations remains somewhat obscure. At first, he may have made temporary league with remnants of the exiled Ghibellines in Tuscany, who had never

relinquished their strong though illusory hope of staging a military return to Florence; but if so, he soon wearied of these false allies and became a party unto himself. For the remainder of his life he moved from court to court, mainly in the principalities of northern Italy.

Of one thing we can be relatively sure: Dante would not have written his *Commedia* without the bitter experience of exile. This is one reason why the poem is fictionally dated as taking place in 1300—that is, at the time of Dante's most active political involvement, which led to his exile—and why its central plotline is his growing awareness, through a series of cryptic prophecies, of an impending disastrous blow. It also helps to explain the values of divine comedy itself: along his way, Dante the pilgrim acquires the spiritual strength and courage he needs to cope with the tragedy of history. As a result, when he receives the clearest indication of his fate (*Paradiso*, 17), he already possesses the means to surmount it. Exile is the pivotal event and the central spiritual struggle of the poem. It becomes in fact a fortunate fall, without which Dante would not have been moved to appropriate the actual meaning of the philosophy of Christ. This explains why, beyond the classical prototypes of a visit to the underworld, the grander background of Dante's journey is Christ's passion and, particularly in the *Inferno*, Christ's descent into hell.

Early in his exile, however, in order to clear his name of whatever slander may have been spread about him as a fugitive, Dante set about composing *Convivio* (*The Banquet*), a work of high seriousness that was intended to restore his reputation not only as a poet but as a moral philosopher. There is every indication that when he began writing *Convivio*, he was committing himself to a major undertaking. He projected a work of considerable length: fifteen books, fourteen of which would be extended commentaries showing the philosophical arguments of his poems. *Convivio* is, like *Vita nuova*, largely a collection of the poems he had written during the preceding decade, but in this work the poems are held together by more elaborate commentary. Apparently, Dante was never content with the experience of a single poem; rather, he was ever ready to place the poetic experience in a frame of larger coherence and meaning. Dante completed only four of the books he had projected for *Convivio*, but they are valuable by themselves, detailing his ideas about philosophy,

allegory, and nobility (*gentilezza*). His arguments about *gentilezza* appear in Book 4, which is his greatest work before the *Commedia*; he interrupts Book 4 to insert his first extended argument for the necessity and legitimacy of the empire.

Dante's career took another crucial turn while he was in exile. The hopes of all the Florentine exiles were revitalized in 1308 by the emergence of a new emperor, Henry VII. Stirred by new possibilities, Dante began addressing epistles in Latin to the nobles of Italy, urging them to support this great hope. These epistles are evidence of the high esteem in which Dante was held throughout Italy, and of his personal authority. But Henry delayed unaccountably, as Dante saw it, and also fell victim to deceit on the part of the papacy; shortly after the emperor arrived in Italy in 1310, his appeal began to fade and the French pope, Clement V, turned against him. It was in the midst of this activity and controversy that Dante wrote one of the important polemical works of the late Middle Ages in Italy: *Monarchia* (*Monarchy*, c. 1313). Here, particularly in the third book, Dante uses his philosophical training to good advantage. Formerly, he had argued that there was a need for imperial rule but had avoided alienating the papacy. In *Monarchia* he disputes the papacy's various arguments that imperial power is derivative and hence subordinate. Dante's arguments—clear, incisive, and logical—show that his philosophical training in making rational distinctions had become a very powerful tool. The arguments he makes here are those he would also make throughout the *Commedia*: that secular authority itself has a concern with justice and a power derived from the deity independently. Dante's position is actually more complex than this, however, because he tries to steer a course between secularism and theocracy. On the one hand, he is well aware of the disadvantages of theocracy, and he feels confident in attributing the origins of Italy's troubles to intrusions by the papacy in the affairs of the empire. The result, which he deplores again and again, is that the empire is frustrated, and also that the papacy is tainted by its own worldly interests. The victims of this confusion of roles are the people of Italy, who have no social order, since the arm of the state is unable to impose such order and the church cannot inspire them to follow the teachings of Christ. On the other hand, neither is secularism the answer. Dante argues that somehow there is a connection between the

vision of the earthly city and that of the heavenly city, and an emperor must have some vision of the heavenly city. Dante's problem is, of course, that he is trying to present a theoretical solution for what is a highly nuanced and delicate relationship. He is at his best when he cites historical examples of what cannot be theoretically ascertained; thus he refers to Charlemagne's goodwill toward the church, and to the fact that Justinian could not codify Roman law until he had been disabused by Pope Agapetus of a theological error. It was a sore disappointment for Dante when young Henry VII died before being able to complete what had seemed to be a divinely appointed mission. In the lofty circles of paradise, however, Dante reveals his own philosophical vision: he sees a seat reserved for the "great Harry" (*alto Arrigo*) who, tragically, came to save Italy before Italy itself was ready to be saved. In all of his divine comedy, Dante sadly and judiciously records such historical tragedies.

As we try to locate Dante in relation to late medieval Italian culture, we can see that he led the way to creativity in several critical areas. A fundamental area is his lifelong defense of the Italian vernacular as an effective language for literary and philosophical expression. This concern first appears in *Vita nuova*, where Dante informs the reader that what drew him and Guido Cavalcanti together was their agreement that this work would be written entirely in the vernacular. Dante's interest in the vernacular grew into one of its first great defenses—in *Convivio*, which was also written in Italian; and in *De vulgari eloquentia*. He also developed a corollary: that the poetic powers of the vernacular needed to be enhanced through imitation of the ancients. These motives and arguments would be echoed in the literary renaissance of France and England.

Dante's defense of the vernacular is a confident and forthright defense of the validity of his own culture and experience. In particular, Dante disputes the poetasters who try to excuse their own deficiencies by denigrating their native language and holding up the Provençal *langue d'oc* as its poetic superior. Dante invokes a parallel situation, Latin versus Greek literature, arguing that if the Romans had acquiesced in the purported natural superiority of Greek, there would never have been a Latin literature. The analysis is remarkable, as is its conclusion—Dante's quite accurate prophecy of an entirely new literary culture. Dante predicts that the Italian vernacular:

. . . shall be the new light, the new sun, which shall arise when the worn-out one shall set, and shall give light to them who are in darkness because of the old sun, which does not enlighten them.

The sociological implications of this statement are no less astonishing than its literary implications. The Italian language will be used to bring learning and lessons in virtue to people who have until now enjoyed no such benefits. Dante is describing a revolution: the twilight of Latin culture and the emergence of an urban lay culture. Through Dante's promotion of the vernacular, and his own example, Italian was soon to become the leading literary language of Europe, a position it would continue to hold for more than 300 years.

Still, this defense of the Italian vernacular did not satisfy Dante's purposes: his real, abiding aim was to enhance it. Thus *De vulgari eloquentia* is a natural complement to the arguments in Book 1 of *Convivio*, the one defending the vernacular and the other showing how the vernacular can become a vehicle for superior literary expression. Although the formulations here are quite specific, it should be remembered that this impulse to elevate poetic practice beyond the local and the municipal had already been present in *Vita nuova*. Dante's own ambitions aspired to the level of the classics. The lesson he devises in *De vulgari eloquentia* is clear, and it would be repeated by all the ambitious writers of the Renaissance. To become true poets, Dante insists, those who write in the vernacular must abandon chance and acquire doctrine: that is, they must themselves adopt a conscious poetics. The best way to achieve this higher skill is by imitating the ancients; the more closely we imitate them, the better poets we will become (*quantum illos proximius imitemur, tantum rectius poetemur*). Thus when Virgil returns in *Inferno* 1, he brings with him the larger poetic vision and practice of the classical world as well as its moral wisdom. In an even more memorable reunion in *Inferno* 4, Dante himself joins the circle of five classical poets, bridging the gap between them and becoming the sixth of their company (*sesto tra cotanto senno*, 102).

These astonishing changes in society, in language, and in poetics that Dante announces require a new personage: the philosopher as mediator, the lay philosopher—someone who might today be called an

intellectual. This person moves with skill and understanding between the technical philosophers in the schools and the newly enfranchised lay readership. Dante casts a new role for himself, a role he has inherited by adhering to the civic humanism of Brunetto Latini. But Dante went one step farther. In 1292, as he tells us in *Convivio*, to console himself for the death of Beatrice, he began attending lectures in philosophy. His concept of poetry thus came to include a notion of the poet as teacher and even as seer, a figure combining art and learning. Separating him even farther from his Florentine teachers and his compeers was his later insistence on Italy's need for a single ruler—an emperor. In all these ways, Dante separated himself from much of contemporary Florentine opinion. Indeed, we can see that Dante's evolving attitude toward politics, philosophy, and poetics was setting the stage for the *Commedia*. At the same time, though, we can also see that little in Dante's earlier career prepares us for the scope and poetic reality of the *Commedia*; it has the sheer unpredictability that is a prime quality of any work of genius.

The *Commedia* uses a relatively simple storytelling device: an extraordinary visit by a living human being to the three realms of the afterlife. There is much that is fantastic in this conception, and much that shows Dante's extensive powers of invention as he works out its details. But what is even more important is that this fiction allows an extraordinarily rich panorama, the fullest imaginable account of the people, manners, ways, issues, and thought of his time. One of the earliest critics of the *Commedia*, Leonardo Bruni (c. 1370-1444), who had himself inherited and shaped Florentine civic humanism, praised the freedom and range that Dante's structure permitted. Bruni doubted that anyone else ever "took a larger and more fertile subject by which to deliver the mind of all its conceptions through the different spirits who discourse on diverse causes of things, on the different countries, and on the various chances of fortune."

Within this larger structure, the primary unit of the poem is the canto—itself a major poetic device and one of Dante's most important inventions. The cantos are powerfully condensed segments varying in length from about 115 to 150 lines, and they allow Dante to do two things: vary his landscapes and engage a remarkable array of different individuals in discourse. In fact, the meaning of a canto derives partly

from an interaction between landscape and personal exchange. The canto has scope and yet compactness, so that it is a dense, complex dramatic unit in which simple or sometimes elliptical phrases can have extraordinary powers of reference. In modern times, the study of individual cantos—*lettture dantesche*—has become a favored and rewarding approach to the poem.

In fact, the study of individual cantos has become so valuable that it has had the unfortunate side effect of hindering fuller study of another quality of Dante's imagination: his network of imaginative-cross references. There are larger connections between cantos, startling juxtapositions, suites of cantos, and parallel placements of individuals in the various canticles, all of which invite comparison. Appreciating Dante's architectonics is one of the genuine pleasures of reading his text. The superabundance of Dante's imagination gives his enormous poem some of the qualities of a medieval cathedral; but we can also see that the *Commedia* reveals the higher function of literature—its coherent power—that Dante had tried to make his own as early as *Vita nuova*.

All great poets discover their own forms, and another important invention in the *Commedia* is the canticle, a set of cantos. *Inferno*, *Purgatorio*, and *Paradiso* are surprisingly similar in structure. Each has a prologue (in *Inferno*, introducing the entire poem, there are two such cantos), followed by preliminary cantos: in *Inferno* the cantos preceding the city of Dis; in the second canticle, the *ante-Purgatorio*; and in *Paradiso*, those under the shadow of the earth. Approximately one-third of the way through, the purpose of the canticle is intensified. In these long middle sections, the heavy work is done. The canticle culminates in the fuller meaning of its experience in the nadir of hell or at the heights of Purgatory and paradise. In *Inferno*, after the Malebolge, this climax is the Cocytus, beginning in Canto 31; in *Purgatorio*, the climax is the Earthly Paradise, beginning in Canto 27; in *Paradiso*, a new tone and intensity of experience are gained beginning with the address to Mary in Canto 23.

In the mysterious and miraculous circumstances of *Inferno* 1, the long-absent spirit of Virgil returns to prevent Dante from backsliding and to redirect his energies. The specific itinerary involving this change of direction brings back to western literature a central theme of

classical epics, the visit to the underworld. However, this itinerary is itself revised: Dante quite consciously alters the pattern of the classical epic. In classic examples such as *The Odyssey* and *The Aeneid*, the visit to the underworld occupies the middle books (Book 11 in *The Odyssey* and Book 6 in *The Aeneid*), and these episodes are central not only in placement but also because they communicate essential wisdom. Dante's Christian itinerary is different. Hell is not the pivot but rather a preliminary episode, in which Dante encounters not the true values of his culture but rather the gods that failed. Dante's motive is not to take on the wisdom of the place but rather to unlearn the values that failed to serve him in his travail. He must be disabused of false notions, and consequently hell is a place of disaffection. For this reason, hell is the initial experience, not the median (in this schedule, Dante and another Christian poet, Milton, are perfectly in stride).

To be sure, we encounter in hell imposing and memorable characters such as Francesca, Farinata, Brunetto Latini, Ulysses, and Ugolino. Their stories, their fates, and their agonies are so inventive and so powerful that it was almost natural for the Romantics of the nineteenth century—the post-Napoleonic age—to identify with these doomed characters, to see them as icons of dismay, and to take them as the significant heroes of Dante's poem. In the twentieth century, a time when readers cast a more ironic eye on such projections of the self, these characters lost some of their allure. Indeed, some twentieth-century counter-Romantics called Francesca a Madame Bovary and regarded Ulysses merely as a footloose adventurer. Twentieth-century critics tended to be more conscious of the totality of the poem and considered it appropriate to put some distance between the reader and the characters of the *Inferno*. They also discerned a distance between the author, with his full understanding, and the naive narrator—the pilgrim who is only on the way toward gaining the fuller comprehension that has been in the author's possession from the beginning.

The intermediate but central and pivotal poem in Dante's trilogy is *Purgatorio*. Here the painful process of reconstruction begins. In *Inferno*, the characters have distinct identities, but in *Purgatorio* they adhere to the central motif of pilgrimage. In this sense, *Purgatorio* is dominated not by individualism but by spiritual brotherhood. Poetically, the cantos are not devoted to grand individuals but consist of

a medley of forces and figures.

Purgatorio includes abundant discussions of art, poetry, philosophy, which are notably absent from *Inferno*. Nevertheless, *Purgatorio* is a canticle of stringent exclusions: any forces that do not contribute directly to salvation must be abandoned. For this reason, the summary plot of *Purgatorio* involves a rejection of Virgil. Virgil, the father to whom Dante gave himself for his salvation, the embodiment of the poetry and wisdom of the classical world, is now himself found to be deficient. Because he did not present in his own poetic works the kind of fullness that Dante discovered in the philosophy of Christ, Virgil must now succumb to the historical vision that was his own. Virgil must give place to Beatrice, who will now be Dante's mentor and his guide to the possibilities of the Christian vision.

Dante was heir to a heroic Roman culture and was convinced of the Tightness of the creative design for the universe; therefore, it would not have been fitting for him to rest his poem on the straitened consolations of the purgatorial way. The purpose of the original divine creation was not restraint but fulfillment. Appropriately, then, Dante's trilogy is capped by *Paradiso*, where the original human instinct to return to God finds its rightful, heroic fulfillment in the lives of the saints. *Paradiso* brings to completion the triptychs of the poem. But while the vision of *Paradiso* is transcendent, it does not obscure the preceding books; rather, it asks us to look back, to consider its exemplars in relation to their antecedents. In this sense, although the *Corn-media* is a poem in process, its vision is retrospective. The meeting with Piccarda Donati in *Paradiso* 3, which creates a powerful impression, is intended to recall the meetings with Francesca in *Inferno* and La Pia in *Purgatorio*; these meetings are an ensemble of cross-references and mutual commentary. We cannot fully assess Francesca until we have experienced La Pia, and each of these two is incomplete until we have known Piccarda. This method implies freedom as well as divine trust. We are not confined to Francesca's powerful appeal; the essential life-force and motives of love that are misdirected by Francesca are redirected by La Pia and find their fulfillment in Piccarda's sublime faith: "In his will is our peace" (*E 'n la sua volontade è nostra pace*, 3.85).

These motives—freedom and fulfillment—are realized in an even greater triptych controlling the central cantos of each canticle. Imitating

and transforming the pivotal episode in Book 6 of *The Aeneid*, where Aeneas receives the message of his life from his own father, Anchises, Dante constructs the central encounter of each of his books around a father figure: Brunetto Latini in Canto 15 of *Inferno*; a composite of Guido del Duca and Marco Lombardo in Cantos 14-16 of *Purgatorio*; and his own great-great-grandfather in *Paradiso* 15–17. Each meeting addresses the central topic of the *Commedia*, Dante's preparation for the coming blow: for exile. Although each provides essential information, it is from Cacciaguida that Dante acquires the clearest idea of the impending tragedy; and as we have noted, at the same time he receives (as he has been receiving all along) the resources to cope with that catastrophe. Christian realism encompasses the tragedy of history and also provides the means for transcending history; this is why, in its fullest meaning, the poem may be regarded as a divine comedy. Brunetto Latini is a worthy man but a marred exemplar; Guido del Duca and Marco Lombardo are sustaining figures along the way; but it is in the presence of Cacciaguida, Dante's biological as well as spiritual source, that he discovers the intimate meaning of his life. He transcends the need for consolation: "You are my father, you give me all boldness to speak, you uplift me so that I am more than myself" (*Paradiso*, 16.16-18). These lines manifest the purpose of the poem, heroic paideia (or ultimate education). In *Inferno*, paideia is dysfunctional: the exemplars are false figures, parts of the mind of hell and aspects of the problem rather than of the solution. In *Purgatorio* there are no heroic figures at all; all the figures partake of a penitential discipline and a spiritual brotherhood. In *Paradiso*, heroic paideia functions rightly as Dante finds his own true nature and expression in the models of Christian history. Not even Virgil offered these intimate, personal, and yet transcendent possibilities for redemption.

Dante's poem is the fullest and most imaginative appropriation of Christian salvation. Within the confines of the Christian scheme, the *Commedia* stretches from the first day to the last night, from the creation to the crucifixion and the resurrection. Its greatest distinction is that it embodies this scheme in significant, distinctive historical types. In fact, these lively, realistic individuals rescue the Christian sense of history from certain monochromatism. Dante is an incarnationist, imbued with the sense that the Christian calendar is

always being relived, relearned, and reengaged. When it vividly realizes religious passion, Dante's poem is part of its own age and a prelude to another age. It stretches from heaven to hell, which are points or coordinates in Dante's fundamental faith that humankind has an innate purpose to return to God, to redeem itself from nothingness. When it is realized, this innate drive leads to the fullness of the saint, whose life bespeaks an absolute dedication to a worthy ideal; but when it is misdirected or defeated by poor educational models, it leads to frustration and obsessive attachments, which are the primary evidence of hell. In this passionate world of manic extremes, such misdirection must result in the terrible thought that it is better not to have been born. A long line of modern western literature, originating in the late Middle Ages in Italy and realized in the Renaissance, rests on these principles: the grand scheme of Christian salvation, expressed by individuals and presented aesthetically in imaginative fiction; and religious passion that stretches humankind between the poles of salvation and damnation. Dante was the first master of this great cycle of literature.

Dante's exile was a difficult time of wandering from one place to another. Throughout these years he was sustained by work on his great poem, which he may have begun before 1308 and completed just before his death in 1321. In his final years, Dante was received honorably in many noble houses in northern Italy, most notably by Cangrande della Scala in Verona and by Guido Novello da Polenta, the nephew of the remarkable Francesca, in Ravenna. Dante died in Ravenna; his burial was attended by the leading men of letters, and the funeral oration was delivered by Guido himself.

Dante's *Commedia* did not have to wait long for recognition and honors. By the year 1400, no fewer than fourteen commentaries devoted to detailed expositions of its meaning had appeared. Giovanni Boccaccio wrote a life of Dante and in 1373–1374 delivered the first public lectures on the *Commedia*. Dante became known as the *divino poeta*, and in a splendid edition of the *Commedia* published in 1555 the adjective *divina* was applied to the poem itself; thus the simple *Commedia* became *La divina commedia*.

Dante Commentaries

Over time, the critical and public fortunes of Dante (1265-1321) and his work have been uneven. However, there is little doubt that the years of his greatest impact and authority are the fourteenth century—which will be discussed here—and the twentieth.

Dante's reception during the fourteenth century is highly complex. The many commentaries that were written to accompany his *Commedia* constitute only the most important and most lastingly visible aspect of the earliest reactions to the poet and his work. The first two canticles of the *Commedia* (*Inferno* and *Purgatorio*), and possibly batches of cantos of *Paradiso*, began to circulate in Italy during the last decade or so of the poet's life. The poem's success was immediate and its reputation wide-ranging. The *Commedia*, unlike any earlier work in the vernacular, reached the whole of the Italian peninsula; its prominence is confirmed by the fact that commentaries on it were written in places as far apart as Milan, Naples, Pisa, and Verona. Furthermore, as the manuscript evidence demonstrates, in fourteenth century Italy the *Commedia* was the most popular book after the Bible. Its penetration is all the more remarkable because medieval Italy was fragmented, linguistically, into many regional vernaculars, and the Florentine dialect in which the poem is written would have been far from familiar to the majority of its readers. The influence of the *Commedia* ranged from schools to pulpits to the street. What is striking and unique about the first generations of its readers and listeners is precisely the diversity of their backgrounds and social origins.

This diversity accounts, in part, for the variety of the critical responses that the *Commedia* elicited, which differed markedly in form,

language, and content. The *Commedia* was the focus of in-depth, organically structured commentaries in Latin and in Italian, ranging from analyses of all its one hundred *canti* to interpretations of individual canticles or even of just a single canto; and it and its author inspired a plethora of other texts in both prose and verse. These include public lectures, summaries, pseudo-biographies, short stories, and discontinuous and connected glosses. The most important are the so-called Anonymous Lombard (before 1325); the *Chiose selmiane* (before 1337), named after their editor, Francesco Selmi; the *Chiose ambrosiane* (1355); and the *Chiose cassinesi* (possibly 1360). *Chiose cassinesi* and *Chiose ambrosiane* are called after the libraries, the Ambrosiana of Milan and the abbey of Monte Cassino, which respectively house the single manuscripts that conserve them. Many other glosses still await editing. No author since classical antiquity had generated such interest, and so Dante's fourteenth century reception marks a significant moment in the history of literary criticism. At the same time, it should not be forgotten that the primary effect of the *Commedia* during the *Trecento* was on the development and character of vernacular culture in general, to which it gave tremendous confidence and energy.

Despite, or perhaps because of, its popularity, the *Commedia* engendered negative as well as positive reactions among intellectuals. Early criticism of the poem, which came from both secular and religious circles, centered on its language (Dante's choice of the vernacular over Latin), its philosophical ambitions, its theological orthodoxy, its political sympathies, and its doctrinal leanings. Indeed, as recent scholarship has begun to demonstrate, all the works Dante wrote after he began the *Commedia* in 1306-1307—namely, *Monarchia* (c. 1316-1318), the *Eclogues* (1319-1321), and *Questio de aqua et terra* (1320)—can be seen as rebuttals to attacks. Many of the commentaries also seem intended to counter efforts to discredit the poem and its author: these commentaries defend, for instance, the orthodoxy, style, and erudition of the *Commedia*. What unites all the extant commentaries is their overt desire to celebrate and monumentalize Dante and the *Commedia*. They constitute the most sophisticated and lasting expression of the fascination with the poem which swept through Italy at the time, and which today can help us contextualize and appreciate the commentators and their works. For too long, and

anachronistically, Dante scholars have considered the commentaries simply as appendages to the *Com-media*—useful primarily for unraveling the poem's many cruxes—rather than as independent texts in their own right.

The commentaries are products of their environment in other ways. As has been mentioned, Dante was ever ready to vindicate his great poem. This attitude stemmed from his clear awareness that critical discourses surrounding literary texts were weighty and significant. Before he wrote the *Commedia*, Dante had composed *Vita nuova* (c. 1292-1294) and *Convivio* (c. 1303-1307) in order to highlight the importance of his own lyric poetry and his own status as a poet. In both *Vita nuova* and *Convivio* he provided detailed prose commentaries of his own to elucidate his verse, and both works are closely modeled on the structural conventions of the kind of manuscript that combined a poetic text and its commentary. To establish the canonical standing of his *rime*, Dante deliberately imitated a textual and critical form that for centuries had normally been restricted to the works of the great Latin poets, although some sporadic and limited exegesis of more recent literature, including vernacular texts, had begun to be written from the twelfth century onward. In *Convivio*, in addition, he drew on the interpretive conventions of scriptural, philosophical, and theological commentary. The commentators on the *Commedia* follow in Dante's wake, not least because in this poem, although Dante did not establish any overt links with the conventions of exegesis as he had done in *Vita nuova* and the *Convivio*, he did fashion a complex system of self-reflective critical allusion that emerges from the action and its poetic representation. Dante's aim was to explain and justify the *Commedia's* experimentation and to establish himself not only as an *auctor* (author) but also, and more significantly, as a vernacular *auctor*, the equal of the great authoritative writers of antiquity. He was successful in this ambition, as is demonstrated by the fact that almost immediately commentaries began to be written on the poem which carefully imitated the conventions of the exegesis on the classical *auctores*: in particular, the division between the introductory *accessus*—the academic prologue to an *auctor*—and the actual analysis of the text's literal and allegorical meanings. The commentators recognized and confirmed Dante's "authoritativeness." For the first time in centuries, a

new *auctor* had entered the canon; indeed, Benvenuto da Imola (1320 or 1330-1387 or 1388), the most incisive of the *Commedia*'s fourteenth-century exegetes, declared that Dante was the greatest of all poets (1.8).

To date, Dante scholarship has found it far from easy to trace a precise history of the fourteenth-century commentators. There are several reasons for this. The nineteenth-century critical editions of most of the commentaries are defective, and it has proved difficult to establish precise dates for many of the original works (the most commonly accepted dates are given in the present essay). Also, several commentaries exist in different versions (those by the *Ottimo*, Pietro Alighieri, and Benvenuto). This has made it especially hazardous to try to establish relationships between different commentaries—a problem which is especially acute as regards the so-called *Epistle to Cangrande*. That work examines the *Commedia* in general by assessing its allegorical structure and by considering it under the six headings typical of one of the standard *accessus* models ("the subject, the author, the form, the aim, the book's title, and the branch of philosophy to which it belongs," 6), before offering a detailed literal reading of the opening twelve lines of *Paradiso*. Scholars continue to disagree as to whether the *Epistle* was written by Dante or not. If it is genuine, the *Epistle* is the key commentary on the *Commedia*, and a fundamental influence on nearly all the subsequent commentaries, since these appear to follow several of its interpretive schemes. However, the philological evidence for its authenticity is far from compelling; and its links to the other commentaries are very few and involve matters, such as the wording of the *accessus* headings and of the poem's ethical definition, which were commonplace at the time. In any case, it is not at all clear from these verbal repetitions whether the commentators depended on the *Epistle* or vice versa. The *Epistle*, in fact, is mentioned only in the *prefatio* (preface) of the last of the fourteenth-century commentaries (c. 1400), by Filippo Villani (1325-1405); thus some scholars hypothesize that it is a late fourteenth-century compilation of several earlier texts. The idea that the *Epistle* is a forgery would also seem to be supported by its conservative exegesis. It fails to assert the radical novelty of the *Commedia*—the issue at the heart of Dante's own commentary—but instead treats the *Commedia* as an ordinary work of fiction with an ethically useful message.

The history of the fourteenth-century commentaries to the *Commedia* can be divided into two main phases: 1322-1340 and 1373-1400. The thirty-year hiatus between them signals a crisis in the large-scale systematic interpretation of Dante under pressure from humanist poetics and is filled by the less ambitious glossing mentioned

above.

The two earliest commentaries conveniently fix the two principal areas of exegetical concern for the whole tradition: the allegorical and literal senses of the poem. Jacopo Alighieri (before 1300-c. 1348), the poet's eldest son, composed his Italian commentary on *Inferno* c. 1322. His intention is almost exclusively to offer an allegorical reading which highlights the universalizing morality of his father's verse. Jacopo is uninterested in matters of history, biography, or language. His commentary is the antithesis of that of Graziolo Bambaglioli (1291-before 1343). Graziolo's Latin reading of the first cantic (1324) was meant to counter the anti-Dante sentiments of the Bolognese political and intellectual establishment. Graziolo, while not entirely ignoring allegorical interpretation, concentrates on explaining the literal values of the *Commedia*, giving special attention to the political, poetic, and intellectual dimensions of the figure of Dante.

The first commentary (c. 1324-1328) on the entire *Commedia* was written in Italian by another Bolognese, Jacopo della Lana, for whom we have little if any reliable biographical information. Jacopo's commentary, which became very popular, marks a growing recognition of Dante's importance within Florence; and it is noteworthy not only for its breadth but also for its pragmatic attempt to bring together a literal and an allegorical exposition. This approach permits Jacopo to display his encyclopedic knowledge and, at the same time, to see in the *Commedia* an allegory of humanity's loss of innocence.

The Carmelite friar Guido da Pisa (thirteenth-fourteenth centuries), writing in Latin, gave a highly original interpretation (1327-1328) of the *Commedia* in its entirety, although his actual *expositio*, based on a complex analytical scheme, covers only the *Inferno*. Guido considers Dante a prophet and the poem an inspired vision: beneath its poetic surface lie divinely inspired truths. In assessing the intimate relationship between the "letter" and its interpretation, Guido makes valuable observations regarding Dante's poetic language.

The *Ottimo commento* is also sensitive to the literary qualities and techniques of the *Commedia*. The title of this commentary, which means "best," was applied in 1612 by linguistic purists who were impressed by the authenticity of the Florentine vernacular in which it is written. The *Ottimo commento* embraces the whole poem and is

apparently an attempt to synthesize contemporary exegeses of the *Commedia*. It was probably written by the Florentine notary Andrea Lancia (c. 1280-c. 1360), who claimed to have known Dante; and it exists in three redactions (1333-1334, 1334-1337, 1337-1340).

Another of Dante's sons, Pietro Alighieri (before 1300-1364), gave a commentary in Latin on the *Commedia*; he prepared three versions of this commentary (1340, 1350-1355, c. 1358). Pietro—in contrast to Guido's religious reading but in keeping with a growing trend of poetically oriented analyses—lays great stress on the fictional nature of his father's masterpiece. He highlights the organic interrelationship between letter and allegory which determines how a *fictio* such as the *Commedia* conveys its meanings. In broad terms, and rather conventionally, he interprets the journey through the afterlife as an allegory of the acquisition of virtue and knowledge, but many of his specific elucidations are distinguished by their flexibility and their avoidance of dogmatism. In addition, his commentary is marked by a wide literary and doctrinal erudition that allows him to examine Dante's sources with considerable sensitivity.

Pietro's was the last major commentary until Giovanni Boccaccio (1313-1375) began his vernacular *Esposizioni* in 1373. Boccaccio's great *Commentariurn*, not least because of its proto-humanism, marks the moment when the more specifically medieval reception of the *Commedia* began to be modified by new interests. With the onset of humanism, new ways of writing and reading began to emerge; inevitably, they led to a fracture between Dante and his fourteenth-century audience, although many concerns and methods of the first commentators continued to exert an influence well into the fifteenth century. It was fitting that Boccaccio was the one who revived the tradition of commentaries on the *Commedia*, because throughout his life he had dedicated himself to celebrating Dante. Boccaccio composed a life of Dante, copied Dante's works, and took Dante as his literary model. The very structure of Boccaccio's commentary—which is unfinished (at the time of his death, he had reached the opening lines of *Inferno* 17)—underscores its distance from the works of previous commentators. Boccaccio rigorously separates literal from allegorical exegesis, so that each canto is interpreted twice. In general, however (as might be expected, given his erudition and his literary propensities),

Boccaccio concentrates on the "letter" of the *Commedia*, an approach which he bolsters with a committed defense of the value of poetry.

Boccaccio's *Esposizioni* began life as public lectures in Florence, which were attended by Benvenuto da Imola, the most original and sophisticated of Dante's commentators. The three versions of Benvenuto's Latin *Comentum* were composed between 1375 and 1380, and the final redaction proffers a highly detailed and learned exegesis that meshes literal and allegorical explication. The commentary is based on school lectures, a form of Dante criticism which was becoming increasingly popular and which confirmed the poet's status as an *auctoritas*. Benvenuto was the first commentator to make serious efforts to explain the poetic originality of the *Commedia*. The protagonist's journey is not only a journey of knowledge, as it was for other exegetes, but also a poetic journey during which Dante establishes his artistic superiority over other writers. Benvenuto's interpretation is remarkably close to Dante's own commentary in the *Commedia*. Indeed, Benvenuto, like Dante, stresses the close links between poetry and theology. At the time, there was an increasingly intense debate on the functions of poetry—a debate in which Dante was assigned a crucial role—and Benvenuto's contribution to it is one of the most eloquent and intelligent expressions of faith in the value of literature. He makes his case in a commentary that reveals his strong awareness not just of the commentary tradition (besides Dante, Benvenuto elucidated several classical *auctores*), but also of the novel exegetical structures he was applying. His *Comentum* was born of a new sense of the worth and importance of commentary and of the commentator, in harmony with contemporary views on the independent status of learning. Not surprisingly, Benvenuto's work exerted a strong influence in the early fifteenth century—the commentary of 1416-1417 by Giovanni da Serravalle (1350 or 1360-1445) is heavily dependent on it—and has been the preferred commentary of present-day Dantists.

Francesco da Buti (c. 1315-1406), who lectured on Dante in Pisa, came under Benvenuto's sway. Francesco, writing in Italian (1385-1395), glosses with enormous precision the bulk of every canto of the *Commedia*; and even though he prefers to focus on its allegorical meanings, his scholarship allows him to elucidate many of the poem's doctrinal passages very skillfully.

The fourteenth century came to a close with two further notable commentaries. The commentary by Anonimo Fiorentino (c. 1400) seems to summarize different interpretations of Dante. By contrast, the commentary of Filippo Villani proposes a radically new allegorical treatment of the *Commedia*. Of Villani's commentary, only the *prefatio* and the *expositio* of *Inferno* 1 survive; nonetheless, it is clear that his aim is to establish close links between the *Commedia* and the Bible: in particular, he believes that Dante's poem, since it has the incarnation at its center and is divinely inspired, reveals Christian doctrine.

During the fourteenth century, Italian intellectual life was inextricably entwined with Dante. The commentators, in their various readings, not only highlighted the complexity of the *Commedia* but, more valuably, demonstrated the possibility and the desirability of a hermeneutics of vernacular writing. They contributed to a debate of such importance that it attracted the attention of the two main cultural figures of the time: Petrarch (1304-1374), who was drawn in with considerable reluctance; and Boccaccio, who displayed excited enthusiasm. There was no major literary question in which Dante's authority was not invoked: he was considered relevant to the relationship between Latin and the vernacular, the function of poets and poetry, and the doctrinal character of literature. Indeed, increasingly, the Latin *auctores* were glossed with the aid of the *Commedia*.

There is little doubt that Dante owes his standing as a classic not just to his own genius but also to the energy and loyalty of his first readers. During the fifteenth century, Dante's reception, despite some continuities with the concerns of the previous century, was determined by the critical interests of the early Renaissance, for which the poet and the *Commedia* no longer played a central role.

Dante Da Maiano

The poet Dante da Maiano (probably b. mid-thirteenth century) was influenced both by Guittone d'Arezzo and by the *dolce stil nuovo*. Almost all his extant poetry comes to us in a single manuscript known as the Giuntina (1527). The scarcity of biographical data related to the poet led Borgognoni (1882) to hypothesize that he was an invention of Renaissance philologists; this theory, however, was convincingly disproved by Debenedetti (1907). Many scholars now identify the poet as Dante Magalante di ser Ugo da Maiano (a neighborhood in modern Fiesole), who appears in city records of 1301.

The literary production that can, despite some apparent editorial interventions, be certainly attributed to Dante da Maiano comprises some four dozen sonnets (including two in Provençal), five ballads, and two *canzoni*. His style has been described as a pastiche of his chief poetic models: Bernart de Ventadorn among the troubadours, Giacomo da Lentini, the Sicilian school in general, and Guittone. Dante da Maiano seems to have achieved a certain local renown in Florence with the distribution of his best-known sonnet, *Provedi, saggio, ad esta visione*, in which he describes a dream vision and appeals to his contemporaries for an interpretation. Among his respondents are Chiaro Davanzati, Guido Orlandi, and Dante Alighieri. What doubtless contributed more than anything else to Dante da Maiano's reputation was a subsequent exchange of *tenzoni* between him and Dante

Alighieri. In all, this poetic interaction consists of eight additional poems: Dante da Maiano's answer to the first sonnet of Dante Alighieri's *Vita nuova*; a five-sonnet exchange known as the *duol d'amore* (three sonnets by Dante da Maiano, and Dante Alighieri's responses to the first two); and Dante da Maiano's *Amor mi fa sì fedelmente amare* and Dante Alighieri's response, *Savere e cortesia, ingegno ed arte*.

Datini, Francesco Di Marco

Francesco di Marco Datini (c. 1335–1410) was among the most successful and ambitious merchants in Tuscany during the late medieval period. He was born in Prato and in 1350 moved to Avignon, where he probably served as an apprentice in an established Florentine trading firm. Around 1358, Datini entered into business with some Florentine associates in Avignon; by 1361, however, he was operating as an independent merchant. Datini remained in Avignon until 1382, when he and his Florentine wife, Margherita di Domenico Bandini, returned to Prato. From 1382 until his death, Datini devoted his considerable energy to managing his main office in Prato and branch offices in Florence, Pisa, Genoa, Avignon, Barcelona, Valencia, Majorca, and Ibiza. An enormous quantity and variety of goods passed through Datini's main and branch offices from all over the Mediterranean basin and beyond. Origo (1957), Datini's principal modern biographer, notes that his goods included "lead, alum and pilgrims' robes from Romania, slaves and spices from the Black Sea, English wool from London and Southampton, African or Spanish wool from Majorca and Spain, salt from Ibiza, silk from Venice, leather from Cordova and Tunis, wheat from Sardinia and Sicily, oranges, dates, bark, and wine from Catalonia."

Datini kept careful records of these and other business transactions, and he also instructed his branch managers to keep all their records. In his will, Datini left his sizable fortune of 70,000 gold florins to the poor of Prato, and he stipulated that all his business papers were to be kept at a palace which he had built in Prato for his family. Clearly, his will was respected, for in 1870 most of these documents were discovered under a staircase in Palazzo Datini, where they are still preserved today. This vast archival collection comprises ledgers and account books, partnership deeds, insurance policies, bills of lading and exchange, and thousands of letters of which some 11,000 are from Datini's personal correspondence. The many letters exchanged by Datini and Margherita are particularly informative regarding domestic life in the late Middle Ages. As a whole, the Datini archive constitutes one of the most valuable caches of documents on business and personal life in Italy during this period.

De Contemptu Mundi

Contemptus mundi, scorn for the world, was a popular theme among monastic writers during the eleventh and twelfth centuries. *Contemptus mundi* poems reflect on the evils of pride, the transitory nature of the material world, the permanence of heaven, and the spiritual and corporeal suffering of fallen human-kind. Two renowned examples include *Apologeticum de contemptu mundi* by Peter Damian in the eleventh century and *De miseria condicionis humane* by Lotario Dei Segni (later Pope Innocent III) in the twelfth.

It was also in this period that Bernard of Cluny (also called Bernard of Morlaix), who was a monk during the abbacy of Peter the Venerable (1122-1156), composed a poetic satire of twelfth-century mores entitled *De contemptu mundi*. This work, nearly 3,000 lines in length, represents one of the most thorough treatments of the theme. The elaborate tone of the poem is complemented by its unusual meter, *tripartiti dactylici caudati*, which uses hexameter lines with both tailed (final) and internal rhyme.

The primary sources of Bernard's *De contemptu mundi* are contemporary events and classical literature, including the Roman satirists Horace, Perseus, and Juvenal. Bernard is set apart from other authors of *contemptus mundi* works by his distinct imitation of the Roman satirists. His critique of medieval life includes a diatribe against Rome, a lengthy attack on women, and a sharp assault on vice and crime. Bernard also provides a highly detailed account of human depravity that includes an invective against ecclesiastical abuses as well as a comprehensive catalog of moral laxity in secular society. Bernard mocks and derides human vices and vanity, but he praises the virtues of

the golden age and exuberantly depicts the celestial city.

Della Bella, Giano

Giano Tedaldi Della Bella (died c. 1311), a Florentine popular leader, is generally credited by historians with shaping the Ordinances of Justice of 1293. He was born into a noble Florentine family that had been knighted c. 1000; according to the chronicler Giovanni Villani, this family was a branch of the Scolari. The family tower, Boccadiforno, was located near Dante's house; and some of the family's ancestors had served as Florentine consuls of merchants and of the commune. Giano Delia Bella himself held land near Empoli and along the upper Arno, was a member of the Calimala guild, and represented the family's business interests in France and Burgundy. He later became a business partner of Chierico de' Pazzi and conducted financial business for the pope.

For reasons that are now unclear, Delia Bella developed strong

partisan sympathies for the *popolo* and became a leader during the 1290s. The *arti minori*, or minor guilds of Florence, developed a military organization that threatened the interests of the upper classes, or magnates; and in 1289 Delia Bella had gathered a following of citizens who shared his open antipathy for the magnates. His role in the passage of the Ordinances of Justice (on 18 January 1293) is obscure, but his mark seems clear. During his priorate, from 15 February to 15 April 1293, the ordinances were radicalized under his leadership. Under the Ordinances, magnates were barred from high office and were to be punished severely for crimes against the *popolani*; and the office of *gonfaloniere della giustizia*—standard-bearer of justice, a kind of popular tribune—was established in Florence.

A natural demagogue, Delia Bella led the mob but was not of it. He seems to have been motivated by a genuine sense of justice and of a need for reform. In 1294, since he had to wait two years before he could reenter the priorate in Florence, Delia Bella became *podestà* (city magistrate) of Pistoia, which was torn by factions. His contemporary and friend Dino Compagni tells us that "he ruled them honestly but harshly, for he burned the houses outside the city where they received exiles in violation of the decrees." Pistoia had enacted laws similar to the Ordinances in Florence, and Delia Bella treated the Pistoian clergy as magnates and prosecuted them accordingly; for this, he was excommunicated by Bishop Tommaso of Pistoia.

In December 1294, Della Bella served on a commission to revise the Ordinances, and several of its members plotted his downfall. Since Dino Compagni recounts several other conspiracies, there seems to have been a pattern of innuendo and character assassination that undermined Delia Bella's effectiveness. In January 1295, a popular riot broke out against the Florentine *podestà*. Although Delia Bella tried to calm the crowd, his enemies accused him of leading it, and even many of those who knew the truth resented his interference; thus his star began to fall. Elections held in February brought several of his enemies to the priorate, and on the first day of the session they ordered his arrest. His relatives, the Magalotti, "advised him to leave the city for a few days to calm the furor of the *popolo*. He left, trusting their false advice; and without delay he was banished [on 5 March] and his goods and person condemned" (Compagni, p. 19). Discord followed, as Delia Bella's

supporters and opponents clashed; but in any case he never returned to Florence.

Delia Bella remained in Tuscany for several months and was excommunicated in October 1295. In January 1296, Pope Boniface VIII also condemned him, and he then left for France. During all this, and for twenty years thereafter, his wife Saracina remained in the partially ruined family tower in Florence. In Paris, Delia Bella he went back to work for the Pazzi. He was about seventy when he died.

Della Scala Family

The Della Scala (or Scaliger) family, lords of Verona from 1277 to 1387, played a significant political role in the Veneto before the rise of the Venetian *terraferma* state. The most militarily gifted member of the family, Cangrande I (1311-1329), built a territorial dominion that

included Vicenza, Padua, Treviso, Ceneda, Feltre, and Belluno. His successors attempted to extend their domination southward into Emilia and Tuscany, but this provoked an alliance between Florence and Venice that demolished the Delia Scala *signoria*.

Persons identifying themselves as Delia Scala can be found in notarial acts from the mid-eleventh century, but no clear lineage can be traced until the second half of the twelfth century. The family was of modest origins, part of the notarial and judicial class that was a key constituent of the Veronese commune. Some of the Delia Scala did acquire landed fiefs from urban ecclesiastical institutions, but they were not part of the signorial class holding public rights and castles in the *contado* (countryside). Nor was the family notable in the early politics of the commune. Balduino I was a consul in 1147, but not until the end of the century did members of the family appear again in communal office.

In the 1230s, the Delia Scala abandoned their support of a faction called the Del Conte and with the help of another faction or party, the Quattrovinti (or Quattroviginti), helped bring Verona under the dominion of Ezzelino da Romano. During this period, Ongarello II Delia Scala was rector of Quattrovinti faction and rector of the commune. The tyrant Ezzelino executed and exiled members of leading noble Veronese lineages so ruthlessly that his regime came to depend increasingly on lesser families like the Delia Scala.

When Ezzelino died in 1259, Mastino I Delia Scala was *podestà* (city magistrate) of the *popolo* in Verona. Mastino received more powers as the city struggled to confront serious external threats. From 1260 to 1272, Verona was under constant attack from nobles who had been exiled under Ezzelino. It also faced a threat by Charles of Anjou, but Charles's incursions into northern Italy came no farther east than Brescia. Mastino held several key offices—including *podestà* of the merchants and captain of the *popolo*—and became in fact, if not formally, lord of the city.

The assassination of Mastino in November 1277 brought the *signoria* to fruition. In the climate of fear and insecurity gripping the city after the assassination, Mastino's brother Alberto I (d. 1301) was acclaimed "captain and rector of the *gastaldade* of the arts and of the entire *popolo*." He was given not only full administrative and judicial powers

but also the authority to promulgate and reform city statutes. The entire apparatus of the communal republic remained, but its constituent councils could not meet without license of the Scaliger *signore*, and its officials and soldiers were under his direct command.

Whereas Alberto had been content to rule Verona, his three sons—Bartolomeo, Alboino, and Cangrande—had broader ambitions and preferred military force to patient politics. Bartolomeo succeeded Alberto but was himself soon succeeded by Alboino in 1304. From 1308 on, Alboino ruled with Cangrande, and their offer of support on the eve of Emperor Henry VII's descent into Italy won them the imperial vicariate for the city in 1311. Alboino died later in 1308, leaving Cangrande sole ruler of Verona.

Cangrande immediately moved to expand his lordship. He was made imperial *vicarius* of Vicenza in 1312 and waged the first of many wars against Padua. He kept his army constantly in the field for the next seventeen years. Cangrande gained Feltre in 1321 and Belluno in 1322. The conquest of Padua was finally accomplished in 1327-1328 and was sealed with the marriage of Cangrande's son Mastino II to Taddea da Carrara. Treviso fell in 1329, giving Cangrande dominion over the entire mark (march, or borderland) of Verona-Treviso. He enjoyed it only briefly, however; he died of an illness only days after this final conquest.

Cangrande was succeeded by his brother Alboino's two sons, Mastino II and Alberto II. They continued his expansionist policy, conquering Brescia in 1332 and both Parma and Lucca in 1335. The venture of the Scaliger into Tuscany, however, brought the Florentine republic into an alliance with Venice. By October 1338 the Venetian-Florentine armies had reduced the Della Scala lordship in the Veneto to Verona and Vicenza. In the summer of 1341, the Visconti seized Parma without opposition, and in 1342 Lucca fell to Pisa.

With the deaths of Mastino II (1351) and Alberto II (1352), the Della Scala lordship deteriorated markedly. Cangrande II, who succeeded them, was assassinated by his younger brother Cansignorio in 1359. Cansignorio had his other brother, Alboino (who had already been imprisoned for a decade), murdered in 1375 in order to secure the lordship for his own two illegitimate sons, Bartolomeo and Antonio (1362-1388). Following the family tradition, Antonio had Bartolomeo

assassinated in 1381. When the Visconti sought to take Verona in 1387, Antonio abandoned the city, bringing the Delia Scala *signoria* to an end. Although there was one brief attempt in the fifteenth century to reestablish the rule of the Scaliger in Verona, the family chiefly sought its fortunes across the Alps in Bavaria (where it was known as the von der Leiter) until it died out at the end of the sixteenth century.

During the heyday of the *signoria*, in the late thirteenth and early fourteenth centuries, the Delia Scala developed a significant center of courtly culture in Verona. Alberto built and expanded a family palace next to the palace of the commune, just off the central square of the medieval city, Piazza d'Erbe. The finest artists of the time, including Giotto and Altichiero, contributed to its decoration. Only the church patronized by the family, Santa Maria Antica, and the exuberant family tombs (the *arche Scaligere*) today attest to the Delia Scala influence in this quarter. The Scaliger lords rebuilt most of the city's fortifications and were responsible for Verona's two great compilations of communal statutes: the redaction of 1276 under Mastino I and the statutes of 1327 of Cangrande. The poet Dante received the patronage of the Scaliger court for six years (1312–1318); he wrote *Monarchia* during this sojourn, and he dedicated *Paradiso* to Cangrande.

Della Torre Family

The Della Torre or Torriani, a Guelf family, were originally counts of Valsassina. Martino di Iacopo Delia Torre (c. 1200-1263) became sole ruler of the city-state of Milan in 1259 and energetically opposed the plans of the pope to frustrate its expansion. From 1265 until 1273 Milan was ruled by Napoleone (Napo) di Pagano Delia Torre (d. 1278). At that time Milan represented the main support for the Angevin cause in northern Italy, but in 1273 Napo turned to the newly elected king of the Romans, Rudolph of Hapburg, in order to limit the influence of the Angevin king of Naples. At the battle of Desio in 1277, the Delia Torre were defeated; they were thereupon exiled from Milan, and their old enemies the Visconti took over the lordship of the city.

In subsequent decades the Delia Torre family—thanks especially to the resourcefulness of Raimondo di Pagano Delia Torre (c. 1230-1299), patriarch of Aquileia from 1273 to 1299— consolidated their international position, and they succeeded in reconquering Milan from Matteo and Galeazzo Visconti in 1302. Guido di Francesco Delia Torre (1259-1312), as lord of the city-state, managed to establish his family's control over the Milanese church when his kinsman Cassone di Corrado (d. 1318) was appointed bishop of Milan in 1308. Guido, however, soon began to suspect Cassone of conspiring with the Visconti and had him exiled in 1309. Cassone, supported by the pope and persuaded by Henry of Luxembourg, king of the Romans and future emperor, became an ally of Matteo Visconti in 1310. Guido had to consent to Cassone's and Matteo's return to Milan, upon which the Visconti took power. The Visconti sent both Delia Torre factions into exile in 1311.

Della Tosa Family

The Della Tosa or Tosighi were a Florentine Guelf family, particularly important in the politics of Florence during the thirteenth and early fourteenth centuries. The Delia Tosa belonged to the lineage of the Visdomini (in Latin, Vicedomini), who from the eleventh century on had the very lucrative right to administer, as lay guardians (*vicedomini*), the estate of the episcopal see of Florence during any vacancy.

The remarkable ascent of the Delia Tosa family started at the end of the twelfth century and culminated c. 1300 with Rosso di Gottifredo Delia Tosa (1234-1309). He and Corso Donati were leaders of the Black Guelfs, and in 1302 they sent their White Guelf enemies (including Dante) into exile; thereafter, however, Rosso and Corso, each very conscious of his own importance, started to drift apart. Rosso's kinsman Lottieri, bishop of Florence (1302-1309), along with some other members of the Delia Tosa family, took Corso's side. The efforts of Pope Benedict XI to reconcile the two factions in 1304 proved fruitless, and the pope's death in that year gave free rein to the little group lead by

Rosso. Until his own death, Ross had complete control of Florence. His sons, however, were not able to maintain his position. Their kinsman Simone di Baldo Delia Tosa (c. 1300-1380), was the author of *Annali* covering the period 1115-1346.

Desiderius

Desiderius of Brescia (r. 757-774) was the last of the independent Lombard kings (757-774). At the time of the death of his predecessor, Aistulf, Desiderius was serving as a royal representative in Tuscany; he succeeded Aistulf by successfully challenging an attempt on the part of a former king, Ratchis, to regain the Lombard throne.

Aistulf had been humiliated at the hands of the Franks in 755 and 756, and when Desiderius became king the Frankish threat still hung over the Lombards. Desiderius had eased that threat for the moment by obtaining the support of the papacy for his candidacy for the kingship; in return, he promised to surrender a number of contested places in the former exarchate of Ravenna. Although the position of the Lombard kingdom remained precarious, Desiderius offered strong leadership. Taking advantage of the vacillating policies of the Franks and the papacy, he resumed control over the Lombard dukes, including the dukes of Spoleto and Benevento, and entered into diplomatic negotiations with the Bavarians and Franks. A daughter of Desiderius married Charlemagne.

Desiderius. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle).
Nuremberg: Anton Koberger, 1493, p. 166v.

Desiderius's success aroused the same resistance as before: the Lombard dukes (especially those of Spoleto and Benevento) followed policies dictated by their own interests, and the Lombards' effective pressure against the boundaries of the exarchate led the pope to appeal once more to the Franks. By this time, the Franks' policy had changed, and Charlemagne had repudiated his Lombard wife. In response to the pope's appeal, Charlemagne and a Frankish army invaded Lombardy in 773-774. Many of the dukes failed to support Desiderius, and only Pavia and Verona put up significant resistance to the Frankish invaders. Desiderius was deposed by Charlemagne (who himself took the title king of the Lombards) and was sent to a monastery in Francia.

Desiderius of Monte Cassino

Desiderius (Dauferius or Dauferi, 1027-1087) became Pope Victor III but is especially famous for his abbacy of Monte Cassino. He was born to the ruling family of Benevento and entered three monasteries: first La Cava near Salerno; then Saint Sophia at Benevento (where he took the name Desiderius); and finally, in 1055, Monte Cassino.

In 1058, Desiderius succeeded Frederick of Lorraine as abbot of Monte Cassino when Frederick was elected pope (Stephen IX). As abbot, Desiderius worked toward a reconciliation between the Normans and the papacy. In 1059, he was named a cardinal and papal vicar for the monasteries of southern Italy. Desiderius was present at the death of Pope Gregory VII in Salerno in 1085, and a year later he himself was elected pope, taking the name Victor III. As pope he maintained the policies of Gregory VII concerning lay investiture. Seriously ill, he returned to Monte Cassino, where he died on 16 September 1087.

Desiderius made Monte Cassino a political force to be reckoned with and an outstanding center of monastic life, culture, and the arts. He initiated a great renovation of the abbey's buildings in 1066; fostered the development of the *scriptorium*; and wrote a treatise, *Dialogus de miraculis Sancti Benedicti* (*Dialogue on the Miracles of Saint Benedict*).

Desiderius's beatification was confirmed by Pope Leo XIII in 1887; his feast is observed on 16 September.

Dies Irae

The words *dies irae*—"day of wrath"—begin the sequence from the mass for the dead in the rite of the western (Roman Catholic) church and are

commonly used to refer to the sequence itself. In its present form the text dates from the mid-thirteenth century and is traditionally, though imprecisely, attributed to Tommaso da Celano (c. 1190-1260), who was the first biographer of Saint Francis. However, its origins are in twelfth-century Benedictine spirituality, and the earliest known version of the text is a late twelfth-century exemplar from the area of the Benedictine abbey of Monte Cassino. In seventeen rhymed Latin tercets of extraordinary linguistic vigor and emotive power, it describes the day of judgment and gives voice to the plea of the sinful soul to Christ for mercy and salvation. Even though the attribution to Thomas of Celano appears to be unfounded (at best, he may have edited an existing text into its final form), the apocalyptic intensity of the text is unquestionably in tune with the spirit of early Franciscanism. The *Dies Irae* was a mainstay of the liturgy throughout the Middle Ages and later; it was a required part of masses for the dead until 1969. There have been innumerable musical settings and vernacular translations.

Dino Del Garbo

Dino del Garbo (d. 30 September 1327) was the most prominent member of a dynasty of physicians who practiced in Florence through the eighteenth century. He was the son of the Florentine surgeon Bono del Garbo and the father of the famous physician Tommaso del Garbo. Although Dino was somewhat overshadowed by his more renowned teacher at Bologna, the physician Taddeo Alderotti (d. 1295), he was himself one of the most accomplished academic practitioners of the northern Italian tradition.

The Last Judgment. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 265v.

Dino was born in Florence; his birth date is unknown, but he appears to have studied medicine at the University of Bologna in the late 1280s or 1290s. According to his early biographers, he studied for a year under Taddeo Alderotti, who was Bologna's most noted medical professor. Siraisi (1981), Dino's most recent and most thorough biographer, suggests that Dino may have studied logic as well as medicine with Taddeo, and perhaps also philosophy. Dino was then forced to leave Bologna, for reasons that are now unclear but were probably related to the recurrent factional struggles which disturbed the city toward the end of the century.

During his career as a teacher and medical practitioner, Dino frequently migrated between Italian cities, achieving both wealth and fame. After a brief medical practice in Florence, he returned to Bologna to lecture in medicine beginning c. 1305. After that, civil disturbances forced him and some of his students to move to Siena, where the municipality paid him a handsome sum to fill a chair in medicine. He subsequently taught medicine in Padua, again in Siena, and in Perugia, all the while gaining important patrons such as Albertino Mussato and King Robert of Sicily.

Dino's written works include a number of commentaries on medical and surgical texts, especially on the *Canon* of Avicenna and the works of Hippocrates and Galen. He also wrote a Latin commentary on a well-known love lyric of Guido Cavalcanti (*Donna me prega*). Dino died in Florence.

Dionigi Di Borgo San Sepolcro

Dionigi (c. 1300–1342) was born in Sansepolcro, near Arezzo. He entered the Augustinian order at a young age and immediately distinguished himself by his keen intellect and piety. He studied theology at the Sorbonne in Paris and received his doctorate c. 1324. In addition to his theological studies, he was also greatly interested in classical learning and judicial astrology, and he was even reputed to possess psychic powers. After his studies at the Sorbonne, he moved to the papal court in Avignon, where he first met the young poet Petrarch in 1333. Dionigi's meeting with Petrarch was the beginning of a close friendship that proved crucial in Petrarch's spiritual and intellectual maturation. Dionigi is believed to have given Petrarch a copy of Saint Augustine's *Confessiones*, and henceforth he acted as Petrarch's spiritual mentor. In 1337-1338, Dionigi moved to the Angevin court at Naples. The young Giovanni Boccaccio studied canon law at the *studio* in Naples, and Dionigi became his unofficial tutor, introducing him to the works of Augustine, Petrarch, and the classical authors.

Almost all of Dionigi's own writing has been lost. His most famous work is his commentary (probably c. 1339-1342) on Valerius Maximus's *Factorum et dictorum memorabilium libri*. This commentary, with its many citations of classical authors, became a template not only for subsequent commentaries on Valerius Maximus but also for several of Boccaccio's nonfictional works, such as *Esposizioni* and *Genealogia*

deorum gentilium. Dionigi's other writings include a commentary on the first book of the *Sententiae*, a treatise on logic, and a commentary on the pseudo-Aristotelian *Oeconomia*.

Dionigi and Giovanni Colonna organized Petrarch's poetic coronation, which took place on 8 April 1341; and when Dionigi died—less than a year later, on 31 March 1342—Petrarch wrote his epitaph. Dionigi remains one of the most influential and important figures in *Trecento* humanistic studies.

Diplomatics

The etymology of the term "diplomatics" refers primarily to "diplomas," i.e., documents, of emperors and kings; here, however, the term will be applied to medieval documents in general. Documents—in Latin, *carta*, *diploma*, *littera*, *pergamena*, *pre-ceptum*, *privilegium*, and so on—record important legal proceedings in adherence to certain formalities (Bresslau 1912-1931). For purely practical reasons, documents are classified under two categories: public and private acts. Public documents are diplomas issued by public authorities (strictly speaking, royal, imperial, and papal documents; but documents emanating from municipal and princely chanceries would be included in this category as well). Private documents refer to and regulate the legal actions of those not in power.

In public documents (with the exception of treaties), a hierarchical relationship between the issuer and the recipient of the document is

usually expressed. These documents are of fundamental importance for medieval studies, because they govern a considerable number of legal transactions. In the early Middle Ages these transactions concerned the conveying of real property (donation, sale, exchange, lease, etc.), the granting of privileges or immunities, and the recording of legal proceedings (*placita*); and the use of documents was basically limited to churches, monasteries, the aristocracy, and secular landowners. From the twelfth century on, however, the general use of documents spread to wider sections of the urban and the rural population, and at the same time the content of documents became much more extensive. Now, communal and private legal matters of any type—pacts of alliance, subpoenas, loans, wills, employment contracts, wagers—were placed on record. Consequently, of all the written sources that have come down to us from the Middle Ages, documents form the largest group; and they are of great value for historical surveys because, unlike historiography or literature, they bear witness to medieval reality in direct and simple ways, i.e., without attempts at interpretation.

It is probably true that more documents have come down to us from Italy than from any other European country. This is connected with the fact that diplomatics in medieval Italy derived from its Roman past. The administrative work of the late Roman empire suffered severely during the period of confusion in the course of the barbarian invasions, but a few important elements of the ancient culture, such as literacy among laypeople and the function of notaries, remained; furthermore, the Latin language prevailed in documents.

Although it can be proved that late Roman documents persisted into the sixth century (especially papyri from the Ostro gothic capital in Ravenna), hardly anything is known about the production of documents and other records in the seventh century. During this period, ancient cultural traditions continued and churches and monasteries became the new carriers of written culture; but the documentary tradition as we know it today did not begin in Italy until the eighth century. The documentary scene in Italy in the early Middle Ages presents a very complex picture. The forms adopted in imperial and the royal diplomas followed the traditions of the respective regional authorities. Thus Lombard and Frankish royal charters each have their own features. Byzantine-Greek and Arab territories

continued to exist in southern Italy and Sicily. Papal documents assumed a particular, unmistakable character. When the Normans conquered southern Italy and Sicily in the eleventh century, they borrowed elements of the documentary practice in Italy.

During the twelfth and thirteenth centuries the production of documents increased, and one factor in this increase was the enormous urban growth and renewal in northern and central Italy. Urban centers required more legal regulations, and soon this need was also felt in rural areas. The greater number of documents resulted primarily from a huge increase in private deeds, beginning particularly in the last third of the twelfth century. For larger Italian cities, such as Genoa, Lucca, Pisa, and Florence, the annual output of private documents from the end of the twelfth and thirteenth centuries has been estimated in the tens of thousands. Moreover, the autonomous city communes now had their own documentary administration (e.g., in foreign policy, jurisdiction, and taxation).

The expansion of private as well as communal diplomatics is closely linked with the profession of the notary. According to a contemporary statement, there were more than 1,500 notaries in Milan, the largest city in Italy, during the second half of the thirteenth century. As the person who drew up documents, the notary (called a *tabellio* in Roman antiquity) had enjoyed public esteem since the early Middle Ages. However, during this early period the authenticity of a document recording a legal transaction had been based on the witnesses to it—their rank and their number—rather than on the authority of the notary. North of the Alps, where literacy was limited to the clergy, the most important method of authentication was seal impression; in Italy, by contrast, the use of seals in private documents never gained general acceptance. During the twelfth century in Italy, documents drawn up by notaries came to be preferred. Together with a few witnesses or colleagues, or (exceptionally) even alone, the notary guaranteed the authenticity (*fides publica*) of a document drawn up by him; in the legal studies that began to flourish at this time, such a document is called an *instrumentum publicum*. The new authority of the notary becomes apparent in the use of an individual notarial seal to adorn each document. The rising demand for notarial services is evident in the fact that many documents were no longer written as single diplomas and

handed out to a *mandator* but were only recorded in a register, the *imbreviatura*, that remained with the notary. This development is best seen in Genoa, where *imbreviature* are assumed to have existed as early as the 1120s, and where the oldest copy has been preserved—the *imbreviatura* of Giovanni Scriba, beginning in 1154.

The commune regulated the activity of the notaries, and every now and then it would intervene directly in their work. This was the case in Bologna: the Bolognese *libri memoriali* are a series of *imbreviature* kept by communal notaries on the initiative and under the supervision of the commune. They convey an idea of the vast production of notarial acts at the time. Some 3,600 volumes from the mid-thirteenth century to the mid-fifteenth still exist; and for the period from 1265 to 1300, more than 250,000 entries of private legal transactions are recorded on 37,000 pages.

Disticha Catonis

Disticha Catonis (or *Dicta Catonis*), a collection of Latin aphorisms in prose and verse, was put together by an unknown author, probably in the third century after Christ. The oldest extant manuscript (Verona, eighth century) suggests that Cato the Elder (also known as Cato the Censor, 234—149 B.C.) was the author, but later medieval commentators recognized that this ascription could not be correct, because the work refers to Lucan and Virgil, who lived long after Cato's time. The transmission of the text to the Middle Ages probably took place in Spain.

Throughout the Middle Ages, *Disticha Catonis* was an essential part of elementary training in Latin grammar, and since the aphorisms conveyed worldly wisdom, they could simultaneously serve as a basis

for moral instruction. Accordingly, in medieval tradition the aphorisms were arranged in four books, which were said (not altogether convincingly) to correspond to the four cardinal virtues: prudence, justice, fortitude, and temperance. The *breves sententiae* (short maxims) in prose that precede these four books of verses, as well as the metrical *praefationes* (prefaces) that introduce Books 2 to 4, are probably later interpolations.

The broad educational significance of *Disticha Catonis* is reflected in the widespread and often allusive use made of it throughout medieval literature; clearly, authors could count on their readers' thorough knowledge of this work. Further evidence for the pedagogical importance of the work is the large number of commentaries, glossed editions, and translations in various vernaculars that began to appear in Italian toward the end of the thirteenth century and continued well into the fifteenth.

Dolce Stil Nuovo

Dolce stil nuovo designates the third and culminating phase of Italian lyric poetry before Petrarch. After the Sicilian school (phase 1) and the polycentric Tuscany of Guittone and his followers (phase 2), the *stilnovo* originated in Bologna with Guido Guinizzelli and was developed in Florence by Guido Cavalcanti, Dante, Lapo Gianni, Dino Frescobaldi, and Gianni Alfani, with an important outpost in Pistoia, represented by Cino. Chronologically, it covers several decades on either side of 1300, although the last twenty years of the thirteenth century, which encompass the bulk of Cavalcanti's and Dante's lyrical productions, can be considered its core.

Since the term *dolce stil nuovo* was coined by Dante (*Purgatory*, 24.57), we must first determine what it meant for him. When we do, we can appreciate that our connotation is quite different from the original one, in being less specific and more inclusive. Furthermore, although the English equivalent "sweet new style," by now traditional, may still be accepted for the current and generalized meaning of the label ("from Guinizzelli to Cino da Pistoia"), it is not an appropriate translation for the term used by Dante in the *Comedy*, only "new sweet style" can render Dante's idea.

What Dante thought of the development of the lyrical genre in Italy can be reconstructed from some chapters of his treatise *De vulgari*

eloquentia (especially l.xii, xiii, xv) and, more definitely, from two episodes of *Purgatory* (24, Bonagiunta; and 26, Guinizzelli; but see also 11.94–99). Dante's retrospective view was elitist and self-centered. He, too, discerned three periods, but his division does not coincide with ours. In his reading, there was apparently no reason to draw any significant line between the Sicilian poets and their Tuscan continuators. With their respective leaders, or *capiscuola* (Lentini and Guittone), both groups could be considered representatives of a "first style," which was neither sweet nor new. A second style arose when Guinizzelli, whom Dante hailed as his own father and also the father of other excellent poets (*Purgatory*, 26.97-99), brought out *dolci detti* (sweet sayings) and *rime dolci e leggiadre* (sweet, graceful verses; *Purgatory*, 99 and 112)—that is, a "sweet style." Dante assigned much of his own work, and the work of Cavalcanti, to that style. (The two *Guidi* in *Purgatory* 11.97, should be identified as Guittone and Guinizzelli—not, as received opinion has it, as Guinizzelli and Cavalcanti, since there is no other evidence that Dante ever considered the latter a *caposcuola*.) Dante was sure that in the nineteenth chapter of his *Vita nuova* he had renewed Guinizzelli's sweet style. In that chapter, the subject switches from a mournful account of the poet's agony to jubilant praise of his lady as a personal redeemer; and here Dante felt that he was ushering in the third and final era of love poetry: a *dolce stile* totally *nuovo* ("new sweet style"), transferred to the sphere of the sacred. Behind all this there is a religious archetype. Bonagiunta's utterances in *Purgatory* 24 are reminiscent of old Simeon's testimony (*Nunc demitte servum tuum*, "Now let thy servant depart"), suggesting that Dante has revealed a kind of poetic New Testament. In fact, Dante's proud definition of *dolce stil nuovo* is given not in terms of style or even content (either of which might have been assumed to be the real point) but in terms of inspiration. This inspiration is not romantic; it is, rather, religious or Davidic (see *Paradise*, 20.40-42), as though the new rhymes of praise had been written with the god of love as coauthor. For the Dante of the *Comedy*, the god of love could mean only the God who is love. The concept of a direct confrontation between the first style and the third (Bonagiunta versus the Dante of *Donne, ch'avete* and beyond) shows how in Dante's view Guittone and Bonagiunta were wrong and he himself was right; it also creates a

remarkably dramatic effect and undoubtedly adds to the poetic merits of the canto. However, something is missing between the first and the third styles: no mention has so far been made of Guinizzelli's sweet style, a style that stretched from the Guittonian outposts to *Vita nuova* 19 and included Cavalcanti. Because of this gap, a label that Dante had reserved for himself (*dolce stil nuovo*) came to be broadened to its modern connotation, comprising poets from Guinizzelli to Cino da Pistoia.

When *dolce stil nuovo* is defined in terms of this standard, expanded chronology, its thematic range is admittedly rather narrow and repetitive: it consists of a limited repertoire of topics and situations, all pertaining to a lofty sort of love. The lady is praised for her high moral and mental qualities and for her angelic beauty, although her physical attractions are not really described but are only suggested through similes and metaphors of flowers, gems, and stars. Since she is unattainable, the poet's desire for her is excruciating whether she is absent (and he is thinking of her) or present (and his senses are painfully overwhelmed by her glorious epiphany). The lady's own attitude may change from rigorous restraint to sovereign benignity; when it does, the mood of the poet changes accordingly, but in either case he feels privileged and ennobled by the experience. The god of love has an important role in the plot—now showing some mercy toward the poet, now endorsing and even provoking the lady's intransigence. Often, the atmosphere verges on the miraculous, recalling the ecstatic sweetness of certain (especially Franciscan) hagiographic literature. The poets of the *stilnovo* were also interested in the nature and sociology of love: how it might have originated, which human organs and faculties were involved in it, and what kind of nobility—nobility of the heart or of birth—was intimately associated with it. On this subject, they composed important theoretical *canzoni* and circulated *tenzoni* (exchanges) of sonnets.

The two major figures of the movement—Cavalcanti and Dante—reveal very different frames of mind. Cavalcanti is paralyzed by pessimism; his inner struggles (or psychomachias) are expressed with languishing pathos and by dramatic personifications (*prosopopeia*) of his own members and feelings. This pessimism cannot be assuaged by hope, because Cavalcanti has created an unbridgeable chasm between

his own physiological, sublunary notion of love and his Neoplatonic lady, who soars amid heavenly light. In contrast, Dante, inspired by scholasticism, succeeds in reconciling his love with both reason and faith. He is therefore able to regard Beatrice as a personal savior and a mediatrix of grace.

Dante's *Vita nuova*, the lyrical *prosimetrum* that he composed in the early 1290s, is the summit and in a sense the denouement of the *stilnovo*. It served as a sort of collecting station where previous experiments in love poetry were sympathetically processed and standardized, and then, in consequence, as a sort of distribution center. It had a strong influence on other poets, beginning with Cino, who composed a similar story of love and death (with Selvaggia as Beatrice). Petrarch, on the threshold of the Renaissance, was to inherit and develop this strain.

The influence of the *stilnovo* was promptly also felt in other genres, such as allegorical poetry (for example, *Intelligenza*), and, at least on a linguistic level, even in Boccaccio's narratives. In Dante's *Comedy*, the *stilnovo* tradition surfaces, predictably, to provide a halo for the character of Beatrice; but even Dante's wistful idyll with Matelda, in the Earthly Paradise, has a precedent in Cavalcanti's elegant, insinuating *pastorelas*.

Dolcino, Fra

Fra Dolcino (d. 1307) was the leader of the Apostolic Brotherhood, a heretical sect centered in Parma. Under Dolcino the brotherhood became increasingly violent, and it was eventually suppressed by a crusade.

Dolcino was born in the diocese of Novara, the son of a priest. He seems to have received a good education before joining the Apostolic Brotherhood in 1291. The brotherhood had been founded c. 1260 by Gerardo Segarelli; through preaching and apostolic poverty, it sought to usher in a new age of Christian perfection, which the disciples of Joachim of Fiore had predicted would begin in that year. The brotherhood was tolerated at first, but after 1290 it became a target of the Inquisition.

Segarelli was executed in 1300, and soon afterward Dolcino became the leader of the sect. Dolcino proposed a radical form of Joachism that condemned all his opponents, especially the clergy, as ministers of the devil and declared them worthy of death because they were oppressing the true church. He also claimed that he and Segarelli had been sent by God to restore the apostolic life in preparation for Christ's second coming, and that he spoke with the authority of God.

Dolcino and a band of followers fled to the mountains shortly after he took control of the Apostolic Brotherhood, and soon they were

plundering the countryside from a stronghold in the Alps. Pope Clement V called a crusade against them in 1305; two years later an expedition led by the bishop of Vercelli defeated them and captured Dolcino. He was executed on 23 March 1307.

Dominic, Saint

Saint Dominic (Domingo de Guzmán, c. 1170-1221), the founder of the Dominican order, was born in Castile. He did not come to Italy until he was already the father of the fledgling Order of Preachers, but he spent much of his later life in Italy, and he died in Bologna. His remains rest in the church of San Domenico in Bologna, where they are housed in a great stone monument designed by Nicola Pisano and decorated with scenes from the saint's life and the early years of the order.

As with many saints, Dominic's early life is almost undocumented, but portents were written into it later. His mother was said to have dreamed that she gave birth to a dog holding a torch in its mouth: the dog symbolized Dominic's order, which saw itself as God's watchdogs (*domini canes*) protecting the flock from the wolves of heresy; the torch symbolized Dominic's work of rekindling the fire of charity in a world grown cold. The reality was less dramatic: Dominic became a cleric at an early age and was educated by an uncle. He later studied in Palencia, where he acquired a reputation for devotion and zeal. This led to his appointment as subprior of the cathedral chapter in Osma.

In 1203, Dominic accompanied Bishop Diego d'Acebes of Osma (d. 1207) on a diplomatic mission to Denmark. While the two were returning to Castile, they stopped in Montpellier, where they encountered Cistercians who were discouraged by their failure to win the heretical Cathars back to orthodoxy. Diego and Dominic decided to undertake the challenge of answering error by preaching the truth. So as not to look like worldly prelates, they abandoned all their property and went about unattended by pomp. Here, too, legend would provide miracles befitting the zeal of the saint and his mentor. According to one such legend, there was an ordeal by fire, in which orthodox and Cathar alike committed their writings to the flames; the heretical texts were consumed, but those of the orthodox were spared. The initial results of this apostolate were less spectacular; but when Diego returned to his diocese, Dominic remained to carry on with a few brothers. A house for devout women also was founded at Prouille.

Dominic's young family of preachers continued their work despite the upheavals of the Albigensian crusade. On the invitation of Bishop Fulk of Toulouse, Dominic made that city the seat of his operation. In 1215, he went with Fulk to Pope Innocent III's Fourth Lateran Council in Rome. (Another established Dominican legend, often depicted in art,

was that at this council Dominic met Saint Francis of Assisi. Still another is that saints Peter and Paul appeared to Dominic and presented him, respectively, with a staff and a gospel book.) While Dominic was in Rome, he sought the pope's approval of his order, but since the council had forbidden the establishment of new orders, the pope required him to adopt the rule of an existing community. Dominic and his followers chose the Augustinian rule, which was by far the most flexible of the models available. Innocent's successor, Honorius III, was quick to extend his approval to Dominic's family once their choice had been made. In 1217, Honorius also approved the name Order of Preachers, which supposedly had first been suggested by Innocent III.

On returning to Toulouse in 1217, Dominic announced a decision to scatter his brothers throughout western Europe. He was helped in this effort by someone he had recruited in Rome, Reginald of Orléans. Reginald, a trained canonist, was in turn able to recruit university-trained clerics. This facilitated not just the work of preaching but the establishment of Dominican convents in Paris and Bologna, Europe's greatest seats of learning. One of Reginald's important recruits was Moneta of Cremona, a master of the arts. Moneta, with the theologian Roland of Cremona, later founded the friars' house in Cremona; he also wrote *Summa against the Cathars and Waldensians*, one of the earliest Dominican polemical works.

Dominic now decided that he needed a base in Rome itself. As in France, he founded houses of both men and women. In Rome, he took over an abandoned Gilbertine house for the friary he founded at San Sisto; later, he entrusted this site to a community of nuns, and the friars, except for a few chaplains, eventually went to Santa Sabina. The Dominicans would also establish a friary at Santa Maria sopra Minerva in Rome. In Bologna, Dominic made an enthusiastic convert, Diana d'Andalò; but her noble kin refused to allow her to become a nun. Dominic continued to encourage her through his remaining years; but it was left to his successor, Jordan of Saxony, to house Diana and her sister in the monastery of Sant' Agnese.

Saint Dominic: Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 208r.

There was a good reason why Dominic wanted a presence for his friars near the papal court. The diocesan clergy raised considerable objections to having religious do pastoral tasks like hearing confessions, and tradition reserved preaching for bishops. Dominic did discourage his friars from meddling in the affairs of parishes; but he also sought commendations from the papacy for the work of preaching, and Honorius III gave him warm letters of commendation. Honorius's successors would go even farther, granting the friars privileges and often exempting them from episcopal authority. Dominic also made a friend of the papal vice-chancellor, William of Piedmont, whose clerks drafted these papal letters; he himself reciprocated by traveling from Viterbo to Rome to represent the pope in dealings with the Roman

populace.

Though he was frequently in Italy, Dominic continued traveling to visit the outposts of his young order. A tour in 1218-1219 included parts of Italy, France, and Spain. One of Dominic's principal efforts was to encourage mendicancy; thus he required the houses in southern France to abandon such fixed revenues as they had obtained. Poverty was fused with preaching, and preaching became tied to a network of houses of study. This allowed the Friars Preachers to avoid, for the most part, a drift into radical opinions that could have threatened the survival of the order. Dominic's emphasis on education can be discerned as early as 1215-1216, when he encouraged theologians to settle in Toulouse. By 1217, friars were being sent to study in Paris. In 1218, Dominic took the first steps toward founding a house of study in Bologna. The Dominicans' educational program focused at first on the Bible, but other subjects were added to the curriculum later. Moreover, instruction of nuns in the rudiments of sound doctrine was encouraged.

This emphasis on education helped make the university cities of Paris and Bologna the two poles of the order. For a time, Dominic concentrated on Italy, while Reginald, until his death, worked from Paris. The first general chapter of the Dominicans was held in Bologna in 1220. At this meeting, it was decided to alternate chapters annually between Bologna and Paris, beginning in Bologna in 1221. Provinces were established to group the friars' convents. It is a mark of the order's youth that Jordan of Saxony, who had been a member of the order for less than a year, became the first provincial of Lombardy. All convents within a province were to have teachers of theology. Other constitutions were adopted to supplement the Augustinian rule; some were adapted from the constitutions of the Praemonstratensian canons, who had been involved in public ministry early in their history.

Dominic had suffered from occasional bouts of dysentery, but they had not discouraged him from traveling extensively to preach and to visit his brethren. In 1221, shortly after the second general chapter of the order, he was overtaken by his final illness, near Santa Maria dei Monti outside Bologna. He was housed in the cell of Moneta of Cremona and had to use Moneta's spare gown. On his deathbed, warning against the temptations of the flesh, Dominic admitted that he had always preferred speaking with young women rather than older

ones. According to Jordan's account, Dominic also promised to be of more use to the order after his death than he had been in life. Later, the story was told that at the moment of Dominic's death, Guala, the prior of Brescia, saw a friar being drawn up into heaven on a ladder of gold. Dominic's burial service was conducted by Cardinal Hugolino (later Pope Gregory IX), who was then visiting Bologna.

Shortly after Dominic's death, stories of miraculous cures began to circulate. The friars of Bologna soon had to move the body to a more convenient place; they reported that when the tomb was opened, a sweet odor arose from the body. Early on, efforts were made to secure Dominic's canonization. Testimony was taken in Bologna and then in France, and the results of the inquiry were reported to Pope Gregory IX. After the evidence had been winnowed, in July 1234, the pope declared Dominic a saint. His feast day was fixed as 5 August, the day before the anniversary of his death. Throughout the later Middle Ages, Dominic would be especially venerated by his order, together with Peter Martyr and Thomas Aquinas.

Aside from the legends already mentioned, Dominic left behind few colorful stories. In this regard he differed from Francis; however, Dominic's memory would soon be paired with that of Francis,

beginning with the story of their meeting in Rome. In *Paradiso*, Dante, responding to tension between the adherents of the two saints, has Thomas Aquinas praise Francis while Bonaventure, the great Franciscan theologian, praises Dominic. In art, Dominic was depicted with a light on his forehead, frequently as he clings to the foot of the cross. Panels depicting Dominic's life include scenes such as the trial of theological writings by fire. Not until much later, in the paintings of Pedro Berruguete (d. 1504), would Dominic be shown presiding at an auto-da-fé.

Dorninic wrote little that has survived. There is one authentic letter to the nuns in Madrid, *The Nine Ways of Prayer of Saint Dominic* is a considerably later text that probably attained its present form c. 1300; however, it achieved a certain popularity. Recently, art historians have discerned its influence in the paintings done by Fra Angelico for the convent of Observant Dominicans at San Marco in Florence.

Dominican Order

The Order of Preachers (Ordo Praedicatorum, OP) is commonly called the Dominican order for its founder, Saint Dominic (Domingo de Guzmán, c. 1170-1221). It comprises a first order, consisting of friars; a second order, of nuns; and a third order (the Order of Penance), of laymen and laywomen. As mendicants, the Dominicans devoted themselves to a humble apostolic life with no fixed income and no material possessions. In their study and clerical preaching the friars were inspired by the canons regular; their practice of liturgical prayer and conventual life linked them to contemplative monastic traditions.

During its early history the order was associated with Toulouse and other parts of southern France where heretical Albigensian sects were prominent. In the early thirteenth century, Bishop Diego d'Acebes of Osma (d. 1207) and his companion, Dominic, as wandering preachers, catechized the heretics in this region—a mission that Dominic continued after Diego's death. Dominic's group of preachers was episcopally approved as a religious order by Fulk, bishop of Toulouse, in 1215. In that same year Dominic traveled to Rome to seek the pope's confirmation for his order. Since the Fourth Lateran Council (1215) had just decreed that no new religious rules should be created, Dominic based his own order on the rule of Saint Augustine, which would facilitate its preaching better than the more sedentary Benedictine rule. Pope Honorius III approved the Dominican order on 22 December 1216, in his bull *Religiosam vitam*. In January 1217 Honorius confirmed preaching as the order's specific goal and Order of Preachers as its formal name.

Dominic himself was present at the order's first two general chapters, which met in Bologna in May 1220 and May 1221. The first chapter finalized the constitutions of the order; these constitutions

complemented the rule of Saint Augustine and gave the order its own character. In August 1221 Dominic died in Bologna. His shrine there soon became a popular pilgrimage site, and he was canonized in 1234.

Over the next few decades, influential master generals gave the order its final institutional structure and shaped its devotional practices. In 1241 Raimondo de Penafort (Saint Raymond, c. 1185–1275), the third master general, worked the constitutions into a better juridical format. Particularly notable was the contribution of the fifth master general, Humbert of Romans (d. 1277); he standardized the Dominican liturgy (1256), encouraged historical and hagiographical projects, unified the nuns' constitutions (1259), and defended the liberties of mendicant scholars at the University of Paris (1254). Because of its antiheretical background and its zealous preaching, the Dominican order became a vital ally of the papacy in guarding orthodoxy. Indeed, soon after the Inquisition was created in 1231, the Dominicans were appointed the leading inquisitors. The inquisitor Peter of Verona (c. 1205-1252), who was murdered by two Cathar heretics, is regarded as the order's first martyr and is known as Peter Martyr; he was canonized in 1253.

The Order of Preachers operates on three main levels: conventual, provincial, and general. The issues concerning each operational level are decided in collective chapters, headed respectively by a conventual prior, a provincial prior, and the master general. The highest legislative body, the general chapter, met annually until 1370; since then, it has been convened only once every two or three years. The longer intervals between meetings of the general chapters bolstered the position of the master general, which had already been strong.

The Dominican order grew rapidly from its first sixteen preachers, whom Dominic dispersed to various European cities in August 1217. By 1277 there were 404 Dominican convents in Europe; by 1303 there were 590. As a result of the friars' missionary activities, the order continued to grow steadily throughout Europe, even in the sparsely populated northern and eastern borderlands. Nonetheless, the Dominicans, like other mendicant friars, were particularly successful in urban centers, where they responded to city people's spiritual and social needs. Consequently, two strongholds of the preaching friars were the urbanized regions of central and northern Italy.

In the fourteenth century, the discipline of the order declined: the

convents amassed material possessions, and standards of recruitment relaxed. Also, the Dominicans became divided during the Avignonese papacy (1309-1377) and the Great Schism (1378-1431), when western Christendom was ruled by two or even three competing popes. The black death (1347-1351) took a heavy toll on the order's convents and monasteries, causing a steep decline in membership. A reform was initiated in 1369, but efforts at reform were hampered for several years when the French and some other provinces followed the Avignonese pope at the outbreak of the schism. In 1390 Master General Raymond of Capua (Blessed Raymond, d. 1399) successfully launched a new reform; its goal was that in each province, at least one house should rigorously follow the original precepts of poverty and common life. Under the leadership of Raymond himself and Giovanni Dominici (Blessed Giovanni, d. 1419), who was Raymond's vicar in Italy and later a cardinal, the Italian Dominicans worked actively to restore the primacy of the Roman pope and to secure the dominance of the western church in central and eastern Europe, where new religious groups such as the Hussites were gaining a foothold.

Early on, women had been brought into the sphere of the Dominicans, but the actual incorporation of women into the order was not easily achieved. This was mainly because the friars feared that their pastoral responsibilities toward women (*cura mulierum*) would take them away from their own study and preaching. Yet the very first Dominican foundation had in fact been a female monastery, created in 1206 by Bishop Diego and Dominic at Prouille (in France) for Albigensian converts.

In Italy, the monastery of San Sisto (in Rome) was created by Dominic himself in 1221. Saint Agnes in Bologna was founded by the second master general, Blessed Jordan of Saxony, in 1223; two of its nuns—blessed Diana d'Andald (d. 1236) and Cecilia Cesarini (d. 1290)—were among the first Dominican nuns to be venerated and beatified. Jordan of Saxony's letters to Diana and Cecilia's testimony about Dominic's miracles are important sources regarding the formative years of the Dominican order. Humbert of Romans unified the nuns' constitutions in 1259, but their position in the Dominican family remained unsettled. (The position of nuns in other orders was also uncertain.) On several occasions, individual popes had intervened in

favor of incorporating female monasteries into the order; and eventually, in 1267, Pope Clement IV successfully prescribed that the preaching friars were responsible for the spiritual needs of the order's nuns.

The Dominican nuns also follow the rule of Saint Augustine, and their constitutions echo those of the friars, but their contemplative life is closer to the old monastic ideals than to the mendicant precepts of the friars. In fact, for Dominican nuns liturgical and private prayer superseded any other form of religious life, including learning and charity. From an early point, these nuns led an cloistered monastic life. Their seclusion from the world and their full commitment to communal life were emphasized during a reform at the turn of the fifteenth century; and the first reformed Dominican institution was that of Blessed Clare Gambacorta (d. 1419), the strictly cloistered Saint Dominic in Pisa (founded 1385).

Dominic and his companions had been inspired by the same ideals that characterized the religious lay movements of their time: voluntary poverty, apostolicism, and asceticism. The friars themselves formed a clerical group, but the order continued to attract the laity as well. Initially, the Dominican lay associations were antiheretical organizations for men. By the late thirteenth century, however, the Order of Penance consisted primarily of women, especially widows, who entered it for social stability as well as for solace.

In 1285, a Dominican master general, Munio of Zamora, drafted a rule for these penitents. That rule did not receive official papal approval until 1405, but the order had attracted lay people throughout the thirteenth and fourteenth centuries. Its members lived mainly in private homes as secular penitents (*sorores saeculares*) until the latter fifteenth century, when convents for regular penitents (*sorores regulares*) become popular. Penitent women were particularly numerous in northern and central Italy, where the most notable women mystics were penitents rather than nuns. Women such as blessed Benvenuta Boiani (d. 1292), Joan of Orvieto (d. 1306), and Margaret of Citta di Castello (d. 1320)—to mention just three examples—were seen as saintly for their asceticism, their visionary mysticism, and their miracles. The most prominent saint in the third order of Dominicans was Catherine Benincasa of Siena (1347-1380), who was canonized in 1461 and

declared a doctor of the church in 1970. Catherine's piety encompassed active charity, teaching, and political missions as well as Christocentric mysticism, and she has come to epitomize the Dominican laity. Her book about Christian perfection, *Il dialogo* (c. 1378), is an early masterpiece in the Italian vernacular.

The Dominicans' emphasis on preaching and learning produced an efficient schooling system for scholars and preachers. Each priory had a lecturer (*lector*) who gave public readings to share his theological learning with the convent's other members. A student who was attracted to this world of learning would proceed gradually from conventual and provincial schools of liberal arts and theology to the order's regional centers for studies (*studium generale*) and to universities. In Italy, the *studium generale* in Bologna (1248) and the later foundations in Florence, Genoa, and Naples spread higher theological learning. The center of Dominican studies, however, was Paris, where the friars held a chair of theology at the University of Paris from 1229 on and where the famous priory of Saint Jacques was located. Numerous Italian Dominicans traveled to Paris to study and teach. One of them was Saint Thomas Aquinas (c. 1225-1274), who in his *Summa theologiae* and other scholastic writings used Aristotelian philosophical principles to clarify theological questions.

During the Middle Ages, the Dominicans were ardent compilers of biblical concordances, encyclopedias, preaching manuals, penitentials, and edifying *exempla*—stories, legends, and translations from Latin to the vernacular. Many of these publications were aimed at facilitating the work of preachers and strengthening the faith of ordinary believers.

Gerald de Frachet (d. 1271), in *Lives of the Brethren* (*Vitae fratrum*, 1259), recorded edifying stories about Dominic and the early Dominicans. Gerald was French, but his work was widely read in Italy as well as France and strengthened the preaching friars' devotion to Mary. The *Golden Legend* (*Legenda aurea*, c. 1260) of Jacobus of Voragine (d. 1298) was a medieval best-seller, as can be seen from the fact that some 1,000 manuscripts survive today. Jacobus's legends of martyrs, confessors, virgins, founder saints, and his own contemporaries shaped the medieval perception of sanctity as ascetic and miraculous. *The Nine Ways of Prayer of Saint Dominic* (c. 1260-1290), by an anonymous Italian Dominican, supported the cult of

Dominic and influenced bodily techniques of prayer. Domenico Cavalca (d. 1357), in his translation (early fourteenth century) of *Lives of the Fathers*, or *Vitae patrum*, championed an eremitical model of ascetic practices and solitary penance. The preacher Jacopo Passavanti (d. 1357) wrote *Mirror of True Penance* (*Lo specchio di vera penitenza*, 1354), a widely read guide to the spirit and practice of penitence. Other Dominicans also gained a reputation as preachers of penance. For example, blessed Jordan of Pisa (d. 1311), Bartholomew of Vicenza (d. 1271), and Venturino of Bergamo (d. 1346) preached in the vernacular throughout the year and especially during Lent, the season of penance. The preaching friars' interest in spoken and written Italian evidently bore fruit, since the laity in Italy was said to be exceptional in its piety and sanctity.

Donati Family

The Donati of Florence championed the privileges of the nobility against the growing power of the Florentine merchant class. Yet they themselves were not landed feudal aristocrats but urban consular nobles dating from as recently as the later twelfth century. As a family, the Donati had an antipathy for commerce; nevertheless, Tolosano Donati lent money to Simon di Montfort in 1250 (and was still operating fifty years later), Giacomo Donati was a banker in London in 1256 and a trader in spices at Genoa in 1259, Aldobrandino and Ottaviano Donati had offices and banks in Genoa and Messina by 1270 (and had married into Genoese patrician families), and Donato Donati was among the Genoese trading cloth at Pera in 1281.

The Donati in Florence, several of whom are mentioned by Dante, lived as an urban nobility and married into feudal families such as the Conti Guidi. The betrothal of the nobleman Buon delmonte de' Buondelmonti to the daughter of Forese Donati (in 1215-1216) resulted in Buondelmonte's murder, which is said to have led to the split between local Guelfs and Ghibellines.

The most colorful Donati was certainly Corso di Simone, who led the clan in the late 1200s. Dino Compagni (c. 1241 — 1324) described him as "a knight after the fashion of the Roman Catiline, but more cruel than he, of noble blood and handsome appearance, a perfect orator with finest manners, acute mind, and the worst disposition." Giovanni Villani (1275—1348) gave a similar though more sympathetic assessment: "the most intelligent knight, the most courageous and best orator, the most able and famous politician of his time in Italy, a man of strong passions and great enterprise." Early in his career, Corso di Simone aided the escape of a fellow noble who had been condemned for poisoning his wife. Corso also abducted his own sister Piccarda, a Poor Clare nun, to have her marry Rosellino della Tosa, to whom she had been betrothed (Dante, *Purgatory*, 24.11; *Paradise*, 3.34-120). Corso won renown at the battle of Campaldino (1289) when, as *podestà* of Pistoia, he led a cavalry charge that resulted in a victory for Florence. He opposed the rising tide of the *popolo* in Florentine politics, specifically as it was manifested in the career of Giano della Bella and the passage of the

Ordinances of Justice of 1293.

A bloody split within the Donati clan and a feud between the Donati and the powerful merchant-class Cerchi family weakened the magnates' opposition to popular change, but by 1298 the faction of disaffected nobles led by the Donati gained dominance in Florence. In May 1299, though, the Donati were caught tampering with justice; they were exiled, and Corso went to Rome. Here he obtained the support of the pope for an expedition against the faction led by the Cerchi, which had taken control of Florence and was sympathetic to the Ghibellines. Corso returned in the train of Charles of Valois in November 1301 and headed a violent campaign of banishment, destruction, and confiscation. In consequence of this campaign, Dante was exiled, as were many of the Cerchi, known now as the Whites because they had recently supported a political faction in Pistoia of that name. The Donati and their faction, who had supported the oppressed Pistoiese, were called the Blacks. The Blacks now controlled Florence, but many Black leaders sought to restrict the role that the fiery Corso wished to play. Finally, Corso openly rebelled in 1308; he was arrested, escaped, and died in flight, having either been killed by troopers (according to Villani) or dragged to death by his own horse (according to Dante: "at a beast's tail dragged dying," *Purgatory*, 24.83).

Dante's wife, Gemma, was a Donati, as was his good friend the poet Forese (d. 1296), Corso's brother. Dante places him among the gluttons in *Purgatory* (23.48-24.99) and reserves special praise for Forese's wife, Nella, as an exemplar among Florentine women ("in good works she is so alone," 23.93).

In the wake of Corso's rebellion the Donati were punished, but in 1311 they were given an amnesty, and in 1317 they received indemnities for the destruction of their property. The family continued to be active in Florentine politics as a "powerful and aggressive house, bulwarks of the forces of extreme conservatism" (Brucker 1962, 35). The Donati also continued their opposition to popular government, and various Donati participated in conspiracies in 1323, 1343, 1344, and 1360. The thirteenth century house tower of the Donati still stands in the Piazza della Signoria in Florence.

Donation of Constantine

Donation of Constantine—in the original Latin, *Constitutum Constantini*—is the name applied to a famous document that was probably initiated in the late eighth century in Rome. Supposedly, it was a grant made to Pope Silvester I by Emperor Constantine I, who was grateful to the pope for having baptized him and for his restoration to health. The charter consists of two parts. One part, known as the Confession, is based on *Actus Silvestri*, a fifth-century legend. The other part, known as the Donation, lists the grants made to the pope. This second section in particular underlay the heated debate that surrounded the document until at least the fifteenth century, when Lorenzo Valla, independently of but simultaneously with Nicholas of Cusa, proved that it was a forgery.

According to the Donation, Constantine endows the Roman see with primacy over all the churches of the world, including the patriarchates of Antioch, Alexandria, Constantinople, and Jerusalem. The Church of the Savior at the Lateran Palace in Rome is to be the head of the

churches. Constantine's properties in Judea, Greece, Asia, Thrace, Africa, Italy, and various islands, as well as the Lateran Palace, are entrusted to Sylvester and his successors. The pope is granted the imperial insignia, including the diadem and purple cloak. The Roman clergy are elevated to several senatorial ranks. Last but not least, the emperor grants Sylvester and his successors power and authority over the city of Rome and all the provinces, places, and cities of Italy or the western provinces. All of Constantine's successors are obligated to observe the terms of the Donation, which is deposited on the tomb of Saint Peter. Legend has it that as a sign of his veneration of Saint Peter, Constantine leads the pope's horse by the bridle. Constantine then withdraws from Rome to found his new capital at Constantinople, since it would be inappropriate for him to rule in a city where the heavenly emperor had established the head of the Christian religion.

How effective this document was and what use the papacy made of it during the Carolingian period are matters of debate, although the document is known to have been available in Rome. The situation changed with the Gregorian reform, when the Donation was cited in a letter of Pope Leo IX, probably written by Humbert of Silva Candida. Other references are found in the formulary of Pope Gregory VII and in the letters of popes Urban II, Hadrian IV (1154-1159), Innocent III (1198 — 1216), and Gregory IX (1227-1241). The popes reconfirmed the Donation well into the fifteenth century, together with other imperial donations. Still, far greater use could have been made of the forgery. According to Fuhrmann (1981), a dangerous ambivalence or ambiguity surrounded the Donation: papal primacy could appear as the gift of a Roman emperor rather than as divinely bestowed. Several popes, therefore, used the document merely as a secondary proof for their claims.

Donato Da Cascia

The composer Donato da Cascia (second half of the fourteenth century) is also known as Donato da Firenze. As with many composers of the *Trecento*, little is known of his life; but from his designation as *presbiter de Cascia* it is understood that he was probably a Benedictine monk at the abbey of Cascia near Florence. Donato is placed in the second and central generation of Italian *ars nova* musicians.

Aside from one *virelai*, a simple piece in the French style, Donato's extant works are all Italian secular settings in working forms of the day: fifteen madrigals and one *ballata* (all for two vocal parts), and one *caccia*. Except for the *virelai*, Donato's music survives in the famous Squarcialupi Codex, which also contains his portrait. Donato's style is conservative, following Jacopo da Bologna in technique, but with parallels to the florid vocal writing of Lorenzo da Firenze. One of the surviving madrigals is thought to have been written in connection with a visit of the German emperor Charles IV to Rome (in either 1355 or 1368); and it has been suggested that another madrigal makes a reference to a marriage in the Delia Scala family of Verona in 1378. Among Donato's lost works are two settings of texts by a distinguished poet of the day, Franco Sacchetti.

Dondi Dell'orologio, Giovanni

Giovanni Dondi dell'Orologio (born c. 1330 in Chioggia) was a physician, astronomer, clockmaker (as his name indicates), and humanist. His father, Iacopo Dondi, also a physician, taught at the medical school at Padua. Dondi dell'Orologio took his degree in medicine there in 1354 and taught at the *studio*, lecturing in astrology and logic as well as medicine.

Dondi dell'Orologio is most famous for his *astrarium*, an astronomical clock which he made for the Visconti palace in Pavia and

which made his name. In addition to the time of day, it showed the liturgical calendar (both fixed and movable feasts), as well as the movements of the sun and moon and each of the seven celestial spheres. It was a marvelous machine, but it stopped working in the *Quattrocento* and was later destroyed. Dondi preserved his plans for the clock in his *Tractatus astrarii*, and several modern reconstructions have been made.

Dondi is also known for his association with Petrarch and other humanists. Around 1368, he became Petrarch's personal physician. This would seem to be a thankless task, since Petrarch's contempt for the medical profession is well documented (for example, in *Invective contra medicum* and *Rerum senilium libri*, 12.1 and 2); but in fact Dondi became a close friend and regular correspondent of the poet. Petrarch showed his own esteem by bequeathing Dondi fifty gold ducats—exactly the same amount that he left to Boccaccio.

An eclectic scholar, Dondi wrote many scientific and literary texts in addition to *Tractatus astrarii*, including a commentary on Galen, *Quaestiones super libris Tegni*; a treatise on the plague, *De modo vivendi tempore pestilentiali*, and a collection of medical remedies, *Experimenta*. His nonscientific writings encompass a travelogue called *Iter romanum*, a Petrarchan epistolary, and a small *canzoniere* of fifty poems in Italian. The variety of Dondi's writings demonstrates the extraordinary intellectual range of this humanist scholar.

Doria Family

The Doria, an old and noble family of Genoa, were Ghibelline rivals of the Guelf Grimaldi family on the western coast of Liguria, while the Guelf Fieschi and Ghibelline Spinola family clans dominated the hinterland of Genoa and the eastern coast. From their feudal domains and castles, these family groups established urban strongholds, or tower societies, in Genoa during the early twelfth century—a process that Lopez (1976) called the "commercial revolution of the Middle Ages." Appropriately, the main burial church of the early Doria clan, with its dramatic series of tombs resembling triumphal arches, was the tenth-century Benedictine abbey of San Fruttuoso, secluded on in a well-protected mountainous inlet of the sea near Portofino.

The first signs of the Doria in Genoa appeared with Martino, who founded the urban family church of San Matteo in 1125, under the Benedictine administration of San Fruttuoso; San Matteo is just to the north of the cathedral of San Lorenzo and the rival Fieschi neighborhood (called an *albergo* in Genoa). The Doria *chiesa di gentilizia* was rebuilt after 1278 in the Lombard Gothic style, which was reserved for four noble clans and was characterized by black-and-white marble facades. The closely clustered towerlike family palaces, enclosed piazza, and *albergo* protected the *consorteria*, or faction: a cross section of related families, middle-class merchants, artisans, and slaves that constituted an insular, heterogeneous, hierarchical social and economic organization.

In the twelfth century, the Doria rose to political power as leaders of the Ghibelline factions in Genoa. They formed a tenuous (and often violently factional) alliance with the Spinola during the period of the consular republic and seigneurial *capi- tani del popolo* (captains of the people) that followed the mid-century wars and crises. The Doria were political leaders, consuls, ambassadors, and *capitani del popolo* (Doria and Spinola *capitani* were usually appointed in pairs, working in concert and competition with each other). The Doria also achieved fame as military captains, and as admirals of the Genoese fleets, often composed of private family armadas, that swept the Mediterranean during the early period of commercial expansion against the Turks,

Pisans, Venetians, and Catalans. A series of famous Doria naval commanders won important victories against rival western powers, even while the Moors were driving Latin crusaders out of the Holy Land and achieving supremacy over eastern Mediterranean ports in the fourteenth and fifteenth centuries.

Ansaldo Doria served as consul, ambassador, admiral and military commander in Iberia against the Moors in 1134. An-saldo's descendants formed a major line of this complex family. His son Simone was elected consul six times between 1175 and 1188 and was admiral at the siege of San Giovanni d'Acari, with Latin crusaders. In the late twelfth century Nicolò Doria and others commanded Genoese fleets against the Pisans for control of Sardinia (Sardegna). Branca Doria—who is notorious by being relegated to hell in Dante's *Inferno* (Canto 33.134)— participated in a decisive victory over Pisa at Meloria in 1284 under the *diarchia* (dyarchy) of the *capitani del popolo* Oberto Doria and Oberto Spinola. The famous admiral Lamba Doria defeated the Venetians at Curzola in 1298; this victory was commemorated by an epic triumphal inscription above the loggia of his family palace on Piazza San Matteo, donated to him by the grateful city. Pietro Doria led the siege of Chioggia in 1380, a step toward ending Genoa's Venetian wars and eastern trade expansion. A brother of Lamba, Jacopo Doria, distinguished himself as an annalist of Genoa, continuing the famous chronicle tradition of Caffaro during the late thirteenth century, while also taking on naval commands and establishing feudal and commercial ties with family members in Liguria, Sardinia, Naples, Sicily, Tunis, and other parts of the Mediterranean.

With the popular revolt of Simone Boccanegra against the factionalism and tyranny of the Doria and the Spinola in 1339, a perpetual dogeship was instituted. Under this arrangement, the old noble families were excluded from public office, although the city still suffered from violence, civil discord, and intervention by neighboring foreign powers: Montserrat, Savoy, France, and Milan. During the fourteenth and fifteenth centuries, however, the Doria and other noble families continued to have a strong influence on the popular doges, particularly the Fregoso and Adorno, through their feudal military commands and their ambassadorships as well as their family wealth and social, economic, commercial and religious sodalities.

The situation changed dramatically with the admiral Andrea Doria (1466-1560), the most famous member of the *consorteria*. Andrea came from an obscure, impoverished branch of the family on the western riviera; he was born in Oneglia, near Dolceacqua, the family feudal seat. His role—military, political, and naval—in the Italian wars culminated with his overthrow of the popular doges and French rulers of Genoa in September 1528. He then reestablished an aristocratic republic of noble families (it was the second oldest republic in Italy after Venice, and it survived until Napoleon's invasion in 1797). In gratitude, the aristocratic republic, led by a biennial doge, gave Andrea a palace next to Lamba's on the Piazza San Matteo, firmly placing him within the family line. At his suburban villa at the entrance to the harbor, Andrea initiated a new "Augustan" Renaissance style of courtly display. Andrea Doria allied the Genoese republic of 1528 with the Spanish Hapsburg empire of Charles V and Philip II, setting the stage for the "century of Genoa" as the city of bankers of the Hapsburg empire in the Mediterranean, Europe, and the new world. Andrea's leadership of the Genoese republic continued after the Fieschi conspiracy of 1547 and the assassination of his nephew and heir, Giannettino Doria. Giannettino's son, Giovanni Andrea Doria (1539-1606), commanded the Genoese fleet under the Hapsburg admiral-general Don Juan of Austria at the Battle of Lepanto in 1571—the last major victory of the west over the Ottoman empire.

Duccio Di Buoninsegna

The painter Duccio di Buoninsegna (c. 1255 or 1260—1319) was born in Siena. He was active largely in Tuscany—and especially in Siena—from the 1270s until he died. Along with a few other artists, including Cimabue, Giotto, and the Pisano family of sculptors, Duccio must be recognized as responsible for taking the arts in a new direction and thereby helping to usher in a new cultural era. Duccio's art has a quality very different from Giotto's but displays the same earnest exploration and experimentation in the depiction of pictorial space and human psychology. Duccio would serve as the touchstone for the Siennese approach to painting for the next 250 years, because he originated a distinctively Siennese type of color, line, composition, and narrative.

The earliest documentary mention of Duccio comes from 1278, when he was paid by the commune of Siena for painting twelve storage chests for official documents. The commune of Siena employed Duccio on numerous occasions. In 1279, 1286, 1291, 1292, 1294, and 1295 he was commissioned by the office of the *biccherna*, the fiscal branch of the government, to paint the wooden panels (known as *biccherna covers*)

that bound the communal registers kept in this office. Duccio's panels (now lost) mark the inception of the commune's practice of commissioning such panels from its leading painters, a tradition that was maintained through the fourteenth and fifteenth centuries. Also in 1295, the commune called on Duccio, along with the sculptor Giovanni Pisano, to be part of a commission to decide where to locate the city's new fountain, the Fonte Ovile.

Duccio's frequent employment by the commune of Siena in what appears to have been the early part of his career must indicate that people had confidence in his ability. However, another side of the artist emerges in some of the documents bound in Duccio's *biccherna* covers: his name appears regularly in the register of penalties levied for offenses against the commune. The first of these, from 1280, does not specify Duccio's crime, but the considerable sum of 100 *lire* suggests that it was serious. (To put this in perspective, Duccio was paid only forty-eight *lire* for one of his largest commissions, a now lost *Maestà* painted twenty-two years later for the Palazzo Pubblico in Siena.) Subsequently, fines were imposed on Duccio for refusing to join a citizens' militia raised to do battle in the Maremma, for being absent from meetings of the town council, for refusing to swear an oath to the ruling *podestà*, and possibly for practicing witchcraft, since one fine originated from the office that was in charge of controlling sorcery. Still, these charges cannot have been taken too seriously, for Duccio continued to be employed by the state and ultimately received the most exalted commission the city could confer on an artist—an enormous *Maestà* for the high altar of the cathedral (*duomo*) of Siena.

Only two of Duccio's documented works survive, but fortunately they are two of the most important. The first is the *Rucel lai Madonna and Child Enthroned*, commissioned in 1285 by the Confraternity of the Compagnia dei Laudesi for its chapel in Santa Maria Novella in Florence. (This work was transferred to the Rucellai Chapel in the 1500s, and after 1937 it was removed to the Uffizi in Florence.) The other is the *Maestà* for the cathedral of Siena, commissioned by the administrator of the cathedral in October 1308 and brought to the high altar there in June 1311. (Today most of the *Maestà* is in the Museo dell'Opera del Duomo, Siena; but fragments are scattered in many other collections worldwide). Separated by some twenty-six years, these two

works set the standard for any additional attributions to Duccio and give a clear idea of his stylistic development.

Because his *biccherna* covers are lost, Duccio's artistic training and activity before the *Rucellai Madonna* are shrouded in mystery. The very fact that early in his career Duccio received such an important commission for a monumental and luxurious altarpiece in one of the largest churches in Florence—which was then Siena's archrival—has led to speculation. Some scholars suggest that the Florentines, who were jealously protective of their own civic accomplishments, would commission only artists with connections to Florence, and therefore that Duccio must at one time have been a pupil of or collaborator with the Florentine artist Cimabue. This hypothesis is strengthened by the fact that until the twentieth century the *Rucellai Madonna* was believed to have been painted by Cimabue. However, the one surviving work by Duccio that critics are unanimous in placing before the *Rucellai Madonna*, the *Crevole Madonna* (Siena, Museo dell'Opera del Duomo, possibly 1280), shows little relationship to Cimabue, at a time when any such resemblance should have been strongest had Duccio truly been apprenticed to Cimabue. The *Crevole Madonna* demonstrates Duccio's familiarity with the work of later *Duecento* Siennese artists, such as Guido da Siena, and his fundamental indebtedness to the art of Byzantium. The format of the Madonna pointing to the child as the pathway to salvation and the schematization of the Madonna's nose, eyes, and hands are derived from these sources. But this apparently youthful work already shows a refined, elegant, taut line; polished modeling; and a warm humanity that herald a fresh interpretation of an old tradition.

Duccio's refinement is seen again in the *Rucellai Madonna*, perhaps the most opulent altarpiece of the *Duecento*. Since it was recently restored, we can fully appreciate the splendid effect of the fields of precious lapis lazuli blue forming the Virgin's gown, set like a gem against a rich variety of tooled gold patterns and delicate hues forming the throne and the shimmering cloth of honor behind her. Everything about the panel conveys ethereal grace and airiness. The gold hem of the Madonna's cloak trickles slowly down in a wandering, sinuous line. Although the angels are kneeling, they seem weightless, hovering one above another, and grasping the throne as if they might otherwise float away into space. The gold itself plays a role in creating this sense of lightness, for every figure and form, including the throne, is enveloped by gold as if in a bubble. Despite its celestial airiness, the *Rucellai Madonna* is full of details drawn from close analysis of nature. Duccio has abandoned the schematic pattern of gold striation in the Madonna's cloak, which was still in use in Cimabue's *Santa Trinita Maestà*, and has taken great pains to model the form of her body beneath her cloak. The Christ child likewise sits believably on the Madonna's lap and,

while giving his blessing, turns his gaze to something at the side that has caught his attention. The accordion folds of the cloth of honor are so carefully modeled that they truly seem three-dimensional. This is an image of exquisite, rarefied elegance, and it must have perfectly fulfilled its function, receiving the hymns of praise sung to the Madonna by the Laudesi before their altar.

Although documents mention a *Maestà*, now lost, painted for the chapel in the Palazzo Pubblico in Siena in 1302, we have no sure example of Duccio's activity after the *Rucellai Madonna* until we reach his greatest masterpiece, the *Maestà* of 1308-1311. Commissioned for

the holiest location in the city, the high altar of the cathedral of Siena, the *Maestà* replaced a much venerated image of the Madonna—the *Madonna dagli Occhi Grosst* (Museo dell'Opera del Duomo, Siena)—that was believed to have produced the miraculous victory of the Sienese over the Florentines at the famous battle of Montaperti in 1260. Such an important location required a new altarpiece of suitable grandeur; and while it was still intact the *Maestà* was the largest and most complex polyptych up to its day: 15 feet (4.5 meters) high by 16 feet (4.8 meters) long. The *Maestà* was painted on both sides, the rear panel providing an extensive series of narratives for the devotional meditation of the monks seated in the choir during the mass; the polyptych also had narratives in a series of predella panels below the central scene and an upper tier of pinnacles. Duccio's *Maestà* coincided with Siena's hope of achieving economic and political hegemony in Tuscany, and it was an expression of civic ambition and pride as much as of sacred devotion. This is underscored by Duccio's signature at the base of the Virgin's throne, which invokes the special protection of the Virgin for her city: *Mater Sancta DeiSis Causa Senis Requiei-Sis Ducio Vita-Te Quia Pinxit Ita* ("Holy Mother of God, bring peace to Siena, and life to Duccio, as he painted you this way").

The Madonna is shown enthroned in a gold empyrean as queen of heaven, surrounded by a court of saints and angels; Siena's four patron saints, Ansanus, Savinus, Crescentius, and Victor kneel prominently in the foreground, in supplication for their city. Despite the glittering opulence of this celestial panorama, a new degree of realism pervades the scene, derived from a knowledge of Giotto and Giovanni Pisano. The Madonna is firmly described in terms of full round volumes, and her throne is not the spindly wooden design of the *Rucellai* panel but a solidly anchored marble structure with arms opening outward as in Giotto's *Ognissanti Madonna* (1306-1310, Florence, Uffizi). The narrative scenes framing the enthroned Virgin and covering the back of the altarpiece contain some of the most remarkable pictorial advances of the *Trecento*. Beginning with seven scenes of the life of Mary in the front predella, the narrative continued with nine scenes of Christ's earthly ministry in the rear predella, moving on to twenty-six scenes of Christ's passion and resurrection, topped by eight scenes of Christ's life after the resurrection, and, returning to the front, completed by eight

episodes from the last events of Mary's life. In their delicacy of line and subtle harmonies of color, these scenes are utterly different from Giotto's narratives in the Arena Chapel; nevertheless, they parallel Giotto's work in their unprecedented exploration of spatial and psychological realism. For example, the *Entry into Jerusalem*, which initiates the cycle of Christ's passion, describes four carefully defined zones of space moving sequentially back into the distance. The skyline of Jerusalem at the top is the most convincing cityscape up to its time (specifically, Siena, with a recognizable cathedral), and it must have provoked Giotto to create his complex cityscapes in the Peruzzi Chapel. Different episodes having the same location in the gospels, such as the events surrounding the Last Supper, or the agony in the garden and the betrayal, are pointedly given the same setting from one scene to the next in Duccio's depictions, establishing a logical continuity which makes the complex structure of the polyptych astonishingly easy to follow. Certain architectural constructions, such as the *Temptation of Christ in the Temple* or the *Feast at Cana*, hint at intricate perspective vistas anticipating the sense of space that would be developed by the Lorenzetti brothers.

On 9 June 1311, after thirty-two months of work on the panel (though there is some speculation that such a large polyptych must have taken longer and thus was begun earlier), the *Maestà* was ready for installation. The day of its transport was declared a civil and religious holiday; all shops were closed, and contemporary documents describe a magnificent procession, amid the ringing of all the bells in the city, of church dignitaries, government magistrates, drummers and trumpeters, and the general populace of Siena, leading the altarpiece from Duccio's studio down to and around the town square, and up the hill to the cathedral. Nowhere else can the medieval fusion of the civic and the sacred be observed so clearly.

Until 1506 the *Maestà* remained on the high altar of the cathedral; from 1506 onward, it stood in a side chapel, remaining a continuous sourcebook of inspiration for Siennese artists through the sixteenth century. In 1771, it was removed to the small church of Sant' Ansano. Shortly thereafter the polyptych was sawn apart: the front and back were separated, and small panels were removed; these have since been dispersed to various collections, but the bulk of the polyptych has been

reassembled and has been exhibited in Museo dell'Opera del Duomo since 1878.

Little is known for certain about Duccio's activity after the completion of the *Maestà* until his death (by 1319). The main work attributed to him during this period is a polyptych of the *Madonna and Saints* (number 47, after 1311, Siena, Pinacoteca). Other important works attributed to Duccio include a glass oculus of the *Dormition, Assumption, and Coronation of the Virgin and Saints* in the choir wall of the cathedral of Siena (1288); a *Maestà* (1288-1300, now in the Kunstmuseum, Bern); a tiny panel of the *Madonna and Child with Three Kneeling Franciscans* (c. 1300, Siena, Pinacoteca); a *Madonna and Child* (c. 1300, Stoclet Collection, Brussels); a portable triptych of the *Madonna and Saints* (c. 1305, London, National Gallery); a *Madonna and Child with Six Angels* (c. 1305, Perugia, Galleria Nazionale dell'Umbria); and a dossal of the *Madonna Flanked by Four Saints* (c. 1305, Siena, Pinacoteca). A fresco discovered in 1980 in the Sala del Mappamondo in the Palazzo Pubblico of Siena, *Submission of a Castle to Siena*, has also been attributed to Duccio (c. 1314).

Immediate followers of Duccio included his nephew, Segna da Bonaventura, the Badia a Isola Master, and Ugolino da Siena; and it seems extremely likely that major *Trecento* Siennese artists such as Simone Martini and Pietro and Ambrogio Lorenzetti were also Duccio's apprentices.

Education

Italy had educational structures and institutions different from those of the rest of medieval Europe. Although many of the same kinds of schools existed—monastery schools, cathedral schools, and later universities—their roles and institutional forms were often different from comparable institutions north of the Alps because of the more highly urbanized character of Italy, especially northern and central Italy. The most important difference was that Italy had Europe's only privately run schools with lay teachers before the eleventh century, and these non-church schools remained the norm until the sixteenth century. Some scholars have seen these urban schools as direct descendants of those run by grammarians and rhetoricians in the towns of the Roman empire. This continuity cannot in fact be demonstrated for any specific Italian city, but such schools are documented widely from the eleventh century onward and were remarked on, along with Italy's urbanized culture and high literacy rates, by contemporary travelers. Much of the burden of elementary education—reading and writing—seems to have been in the hands of private schoolmasters throughout the Middle Ages and into the Renaissance. These teachers could be women, both lay and religious, or part-time instructors such as priests, lawyers, and notaries who accepted individual students. Urban schools before the thirteenth century, however, were not usually organized by local governments, local churches, or monasteries but offered genuinely private tuition. The schoolmaster or schoolmistress contracted directly with parents to teach their children. Even when other, more formally organized schools existed, private tuition in small schools continued alongside them.

The reading and writing schools provided these fundamental skills to the citizens of increasingly commercial Italian cities and reflected the precocity of Italians in developing written records of all sorts. Another

skill taught in medieval Italian schools was *abaco*. This word is related to English "abacus," but the course concerned far more than counting on the adding frame. *Abaco* was the subject we would call business arithmetic. It was taught exclusively to boys. In Tuscany, especially at Florence, there were separate *abaco* schools offering a full-time course; elsewhere, *abaco* was usually combined with the intermediate reading and writing course. At Genoa, for example, where Latin was used for business records far longer than in other cities, there was a combined course in business Latin and *abaco*, aimed at the sons of merchants.

Starting in the thirteenth century, city governments often subsidized private elementary schools or opened their own public schools. Usually the commune would contract to provide a house for the school, or would help the master find one, and pay him a fixed salary. The master in turn promised to reside continuously in the city and instruct all who came to learn. Sometimes masters were required to give poor students free lessons, but usually the master would collect fees over and above his salary for the various levels of instruction. Like the course itself, the fees were task-oriented rather than temporal. Students did not pay an annual tuition, but instead paid a set amount to learn the ABCs, another amount to master the primer, and so on, no matter how long these tasks took. The educational psychology implicit in such a system was that the students learned by imitation of the master, and that each task had to be mastered thoroughly before a student went on to the next one. This notion depended in turn on a Neoplatonic epistemology whereby the student's imitation was seen as a return to the "Creator," mediated by the teacher. Every task had a moral value over and above its specific content. Children were not thought to have a distinct psychology but were considered capable of making moral decisions and developing moral habits in the same way as adults. This approach explains why the communal contracts for grammar teachers almost always described their job as nurturing and safeguarding the morals of the city's youth.

There was no fixed age for starting school; most children who were sent out to reading schools started between ages seven and ten, but some began later while others, especially those tutored at home, might start to read at five or six. After learning to read and write, students had several options. For some, reading and writing were the only skills

needed, and they would therefore go directly into the workplace. Others would take the *abaco* course, which could be combined with practice in keeping business records either in Latin or in the vernacular. A small number went on to study Latin in grammar schools, so called because in the Middle Ages Latin was the only language taught through the analytical rules called grammar. In medieval Italian usage, the word *grammatica* meant Latin. Grammar students learned Latin by memorizing the texts of the primer, usually prayers and psalms, followed by a simple grammar rule book, and then the moral proverbs of the *Distichs of Cato* (*Disticha Catonis*) or the fables of Aesop. Intermediate reading texts included such patristic poets as Prosper of Aquitaine and Prudentius, and also medieval school poetry that imitated Ovid. One common text of this sort was the *Elegy* of Arrigo da Settimelio. Most of the earliest texts given to schoolchildren were poetry, because poetry was believed to be more enjoyable for children and easier for them to memorize. Memory training was an essential part of education at every level. It equipped the student with a large body of easily quotable commonplaces for almost every theme or subject; and in accord with the prevailing Neoplatonic pedagogical theories, it was believed to give a structure to the mind itself that mirrored the ordered plan of the created world.

The Latin program of study is best attested to for the city-sponsored schools of the fourteenth century, but its elementary levels had been much the same in the earlier Middle Ages. There were regional variations in the texts used, and individual teachers had a great deal of freedom in choosing texts, but the techniques of teaching through imitation and memorization were constant. One important change that did occur in Italy from the late twelfth century onward was that students began to have an opportunity to learn to read in Italian only, without studying any Latin at all. In the earlier Middle Ages, Latin had been the only written language, and so learning to read meant learning to read Latin. But as city life grew more complex, commercial and even legal records began to be kept in local dialects; thus more and more people learned to read only the *volgare*, or vernacular.

However, Latin remained the language of the educated classes and a prerequisite for university education; therefore, students who had completed the elementary and intermediate Latin course would

normally go on to study Latin for several more years before entering the university. This preparatory course was intended to give students facility in reading and writing Latin; it was called *auctores* ("authors") because it consisted of intensive study of the authoritative Latin poets and prose writers of the ancient world. The exact curriculum depended on the teachers' and students' interests, but it most often included Virgil, Horace, Ovid (often in expurgated or "moralized" versions), Seneca, and Boethius. As with the more elementary texts, students parsed these texts word by word and committed them to memory. At the preuniversity level they would also analyze the texts according to the rules of classical rhetoric, and they studied history, geography, and mythology by learning the meanings of proper names used by the poets. The skills learned in this way would be applied later in professional courses in law, medicine, notarial arts, and *ars dictaminis*, all taught in the universities.

We should not imagine that the private and communal schools were the only educational institutions in medieval Italy. In the earlier Middle Ages, monastic and cathedral schools like those of northern Europe were much more important than private schools. Several of the cathedral schools, indeed, were very famous in their day: Pavia, Verona, Cremona, and Modena had important schools of this sort at various periods from the ninth century to the eleventh. Several of the great figures of the eleventh-century monastic reform movement, moreover, were educated in monastic schools of northern Italy: Lanfranc and Anselm, successively priors of Bee in Normandy and archbishops of Canterbury, are only the most notable examples. The monasteries of Bobbio (in Lombardy), Nonantola (near Modena), Farfa (north of Rome), Monte Cassino (between Rome and Naples) and La Cava (south of Naples) all had famous schools which accepted lay boys as well as aspiring monks. One major task of schools attached to cathedrals and monasteries was teaching singing for liturgical purposes. Like grammar, music instruction relied heavily on memorization. Texts and melodies were learned together, and the pattern of each was used to reinforce the memorization of the other. The monastic reformers of the eleventh and twelfth centuries stressed the education of monks as a religious elite, and they discouraged "external" schools—i.e., schools for boys from outside the monastery. Gradually, Italian monasteries followed the

example of French and German monasteries in withdrawing from the field of education. With the establishment of the mendicant orders in the thirteenth century, however, clerics took on a broad educational role again, first as preachers, then as educators of their own postulants at *studia* in the major Italian towns, and eventually by opening their schools to a limited number of lay auditors. It is believed that Dante attended lectures of this sort at Santa Maria Novella in Florence. For the most part, monasteries in later medieval Italy offered only upper-level courses and avoided elementary education.

Girls were excluded from the city-run schools and from most private schools beyond the level of reading and writing. They could, however, learn other skills if their parents would allow it, since additional schooling could be had in convents, or, for girls in wealthier families, from private tutors at home. Latin and arithmetic were only rarely taught to girls; instead, their usual education concentrated on domestic arts like cooking and sewing. Even the convent schools taught embroidery and other handwork that could be sold for income. Italian convents of the later thirteenth and fourteenth centuries, especially those associated with the mendicants, often had a very lively cultural life. The nuns read widely and sometimes wrote devotional texts and poetry themselves; they often copied or decorated manuscripts for their own use or for income; they taught their own postulants reading, writing, and sometimes Latin; they accepted lay girls for finishing courses; and they patronized artists, writers, and craftspeople beyond their walls. Much of the devotional literature in Italian composed in the thirteenth and fourteenth centuries was intended for women.

In general, it is fair to say that Italian schools were the most varied and most practically-oriented in Europe before the fourteenth century. They reflected Italy's highly developed city life and also a businesslike approach to education, as to commerce, on the part of the Italian ruling classes. The schools at all levels, right up to the university course, stressed practical professional skills and deemphasized the study of speculative subjects like theology, philosophy, and even literature.

Embriaco Family

The Embriaco were an old noble family of Genoa, originally viscounts, descended from a branch of the Ghibelline Spinola clan. The Embriaco played a major role in the process whereby the Genoese nobility conquered eastern trade routes and built a commercial empire in the Mediterranean during the eleventh and twelfth centuries—a process that the historian Henri Pirenne and Lopez (1938, 1976) described as the early "crusading-military-mercantile privatism" of these nobles. It established Genoa, along with Pisa and Venice, as a leading trading center in the Mediterranean and European economies, driven by the wealth of Muslim, Chinese, and southeast Asian silk and spice routes.

The rise of the Embriaco in the early Genoese republic was due to Guglielmo, a military leader of the First Crusade (1097-1104). Guglielmo commanded the large Genoese fleets—described in the *Annali* of the chronicler Caffaro (who was himself a member of the expedition of 1099)—that took the ports of San Simeon, Arsuf, and Caesarea, opening Genoese trading colonies in Antioch and other markets in the Holy Land. According to Caffaro, Guglielmo scuttled one fleet and used the wooden ships to make inventive siege weapons; as a result, Jerusalem fell to the Christian crusaders on 15 July 1099. Guglielmo's tenacity as a fighter earned him the nickname Testadimaglio, or "Mallethead." He was an ally of Baldwin I, who became king of Jerusalem. As the Genoese *consul exercitus Ianuensium*

(commander of the army) he celebrated with Baldwin the ceremonial liberation of the Holy Sepulchre with a miraculous paschal "mass of lights" and baptismal ablution in the Jordan River.

With the First Crusade, spoliation of eastern relics became an integral part of western colonization. The relics of Saint John the Baptist were brought to Genoa from Mira and installed in the cathedral of San Lorenzo; thus John became Genoa's patron saint and its ceremonial focus. Guglielmo was personally responsible for the *furta sacra* ("sacred theft") of the Sacro Catino from Caesarea; this is a plate or basin of green glass and emerald work from late antiquity with a relief of the head of Christ (or John the Baptist) in the center. According to one legend, it was the plate on which Christ instituted the eucharist at the Last Supper; according to other legends, it was the plate on which the severed head of John the Baptist had been presented to Herod. Today it is in the treasury of San Lorenzo, where it is still revered by worshippers. Such relics, with their ties to the Holy Land, helped define the religious and communal life, the "sacred landscape," of Genoa—as of other early European republics and kingdoms—along with the private associations (*compagna communis*) that made the Genoese crusades possible.

As a result of the conquests and spoils of the First Crusade, the Embriaco gained a monopoly on trade to Antioch and Syria, the source of their wealth and power. The family also became established as lords of Gibelet (Jubail in Arabic) in the strategic coastal city and county of Tripoli, where they remained for two centuries until they disappeared, with the last of the crusader states in the Holy Land, in the late 1290s. The triumphal return of the Genoese fleet in 1101, immortalized by Caffaro, celebrated Guglielmo's military prestige; and Guglielmo's election as consul of the republic in 1102, with his father, Guido Spinola, and a relative, Ido di Carmandino, put him in virtual control of the city.

The twelfth-century fortress tower of the Embriaco near Santa Maria di Castello, with its impressive height and its hillside situation overlooking the medieval city and harbor, is a symbol of the family's almost seigniorial power during the early republic. It is also an early example of medieval rustication, with crenellated battlements crowning the top (although it was heavily restored in 1923). The Embriaco fell

into extinction during the thirteenth century, but their proud tower still remains.

Empoli

Empoli is situated in the agriculturally rich lower Arno valley, about 17 miles (28 kilometers) from Florence and 4 miles (7 kilometers) from the confluence of the Arno and Elsa rivers. In the Middle Ages the important Via Francigena, the main road from Rome to France, crossed the Arno near the castle, and later the town, of Empoli. The town was thus at a junction of the land route northward to France and southward to Siena and Rome with the water route by the Arno from Florence to Pisa and the sea. The name Empoli is ancient; it apparently derives from "emporium," and from the early twelfth century on Empoli has indeed been an important commercial center. Its moment of fame came in 1260, when the Ghibelline victors of Montaperti met there to decide the fate of Guelf Tuscany.

Ancient Roman remains were discovered in 1984, and a document of 780 mentions a church of San Michele "in Empoli." Until 1015, the area around the castle was controlled by Pisa— in fact, it was on the border between Florentine and Pisan territories. In that year the populace revolted and scattered, and Pisans destroyed the castle. The territory fell under the lordship of the Guidi counts, and the local *pieve*, or regional baptismal church, of Sant' Andrea served as a locus for a new market village. In 1119, the countess Emilia, wife of Count Guido Guerra, established this church (today, *collegiata*) as the center for fourteen regional churches and chapels, and their incomes. From this time on the town grew quickly. The people of Empoli generally controlled their own civic affairs, and they formed a defensive alliance with the nearby villages of Monterappoli and Pontorme.

With the descent of Emperor Frederick Barbarossa into Italy, Empoli submitted itself to the protection of Florence in 1181 — 1182. The emperor imposed his own vicar in 1184, but four years later Florence regained control. In 1255, Florence bought out the Ghibelline Guidi counts and installed its own *podesta*. In 1260, after their victory at Montaperti, Ghibelline leaders, including some of the Guidi, pressed for the razing

of Florence. The Florentine exile Farinata degli Uberti argued successfully against this, and the city was spared. After the tables turned, the central position of Empoli made it a natural meeting place for Guelph leaders from Tuscany in 1295, 1297, and 1304, and in 1312, when Tuscan and Bolognese Guelphs convened to discuss their strategy against Emperor Henry VII.

Empoli suffered during the wars between Castruccio Castracane and Florence in 1315-1328, and later during Florence's battles for control of Pisa. In 1333, a terrible flood of the Arno badly damaged the town, and its walls, some sections of which dated from the eleventh century, were ruined. They were completely rebuilt in 1336, however, and were provided with towers and two main gates. These walls were famous in their day, but only a portion of them, dating from 1487, still exists.

The *pieve* of Sant' Andrea was rebuilt beginning in 1093, and its geometric twelfth-century facade in white and dark-green stone is reminiscent of San Miniato al Monte in Florence. The interior of Sant' Andrea was remodeled in the eighteenth century, but it retains a few works from the fourteenth. The Augustinian church of Santo Stefano (1367) has never had a formal facade; however, it contains important remnants of frescoes by Masolino (1430s).

Enna

Enna is a hilltop town in central Sicily. It was known as Enna in classical antiquity but was renamed Kasr Janni under the Muslims; this Muslim name was the derivation of its medieval name, Castrogiovanni, which was retained until 1927.

Enna is important particularly for its role in the Norman conquest of Sicily during the eleventh century. Its mountainous setting and well-fortified castle, parts of which remain today, made it virtually impregnable. The Muslims captured Enna, in the ninth century, only by worming their way under the walls through the sewers. Around 1060, it was the seat of the emir Ibn al-Hawas, one of three major figures in the confused politics of Sicily—an island whose rulers were oblivious of the Norman threat and were preoccupied with establishing their independence from one another and from the the Zirid of Tunisia. In 1060-1061, Ibn al-Hawas held his own sister captive in Enna; she was married to the powerful ruler of Catania (on the eastern coast of Sicily), Ibn al-Thimnah, who tried to win her back by force but was repulsed. In desperation, Ibn al-Thimnah went to Mileto in Calabria and begged the

Normans for aid against his enemies. Roger I, brother of the most successful Norman warlord in southern Italy, joined forces with the emir of Catania, first overwhelming Messina and then marching on Enna. In the fields outside the town, the Normans scored a notable victory over a numerically superior enemy, but they were not able to storm the stronghold of Enna.

The Normans' presence in Sicily eventually united most of the Muslims against them, although in 1067 Ibn al-Hawas was killed in a battle against the Zirid, who had come to save Sicily from being conquered by Christians. Enna itself continued to hold out remarkably well against the Normans, and it was one of the very last places to submit to Roger I (the last was Noto, in 1090). The end came for Enna in 1086, when Roger I captured the children of the new emir of Enna, Ibn Hammud, at Girgenti (Agrigento). Roger began to negotiate with Ibn Hammud, who decided in 1087 to abandon Enna to the Christians. Hammud marched out of the town; allowed his procession to be surrounded by the Normans, to whom he could then honorably surrender; accepted baptism; and went to live on lands granted to him in Calabria.

During the late twelfth century, there were still descendants of Muslim converts to Christianity in Enna, although the town stood in an area that was being subjected to intensive colonization by Christian settlers from the Italian mainland, the so-called Lombardi. One such Christianized Arab may be Maymun of Castrogiovanni, who is recorded as making a donation to a monastery at Caltanissetta in 1179.

Something is known of the economic role of Enna in the late Middle Ages. There were craft guilds in the town by the mid-fifteenth century. References to fairs begin not later than 1420. Between 1277 and 1478, the number of hearths in the town decreased, as elsewhere in Sicily; but at those two extremes there seem to have been some 2,000 hearths, which would indicate a population of approximately 10,000. The saltworks of Enna are mentioned repeatedly in fifteenth-century charters. Its rock salt, needed in the making of cheese (a great Sicilian specialty), was exported to Catania. In 1459, work was under way to exploit new alum mines in the region of Castrogiovanni. In 1453, Alfonso V granted Pietro Mozzicato of Enna the right to explore for alum throughout Sicily. On the other hand, social tension developed in

Enna. In 1453, the city seems to have been divided among four factions, *gentilhomini*, *menestrali*, *borgesi*, and the *popolo*. In 1463-1464 royal taxation was a particular source of tension. In this respect Enna shared the outlook of the other medium-sized Sicilian towns.

Enzo

Enzo (Enzio, c. 1220-1272) was the natural son of Emperor Frederick II Hohenstaufen and an unknown mother. His name was Heinrich, but in Italy he was called Enzo or Enzio. He was the favorite of his father, of whom he was said to be the very image. Sources portray him as handsome, cheerful, fearless, and poetic. Enzo played a substantial role in imperial politics from 1238 until his capture in battle in 1249.

In 1238, Enzo married Adelasia, the widowed ruler of Torres and Gallura in northern Sardinia. Enzo never ruled Sardinia— he came there just long enough to marry Adelasia and to appoint vicars—but the emperor proclaimed him king of Sardinia, and Enzo continued to use that title even after his marriage to Adelasia was annulled in 1245. In July 1239, Frederick appointed Enzo "legate general of all Italy," a "living image" of the emperor to preside over the imperial vicars general of cities in central and northern Italy. Enzo was also empowered to arbitrate disputes, hear appeals, and appoint notaries and judges. Most significantly, he commanded imperial troops and collaborated with Ghibelline warlords such as Ezzelino III da Romano to fight Guelf forces in Tuscany, Lombardy, and the Romagna.

Enzo was one target of a foiled conspiracy against Frederick in 1246, in which many of the emperor's closest friends and advisers were implicated. In the reorganization of the imperial government that followed, Enzo was assigned to Lombardy and the Romagna. He campaigned continuously against the Guelfs in the region. In May 1247, while Enzo was besieging a fortress near Brescia, a Guelf force stole into the city of Parma and seized it. The protracted and mishandled siege that ensued was a disaster for Frederick. In 1248, Enzo married

Ezzelino's niece. Enzo was captured at Fossalto in a skirmish against Guelfs from Bologna in January 1249. Frederick tried desperately to persuade the Bolognese to release him, but they refused. The capture of Enzo crippled imperial policy in Lombardy.

Enzo was imprisoned comfortably in Bologna for the rest of his life. There he wrote simple but affecting poems and songs, many of which are extant. He corresponded widely and was free to receive visitors, both male and female. However, the execution of his nephew, Conradin, by Charles of Anjou in 1268 awakened in Enzo a desire to resurrect the Hohenstaufen cause in Italy. In 1270, he attempted to escape, but he was recaptured and was thereafter held in close confinement until his death in 1272. The commune of Bologna gave Enzo a royal funeral and, at his request, buried him in the church of San Domenico.

Erice

Erice, a hilltop community in western Sicily, was known in the Middle Ages as Monte San Giuliano (Mount Saint Julian), a name it kept until Mussolini restored its ancient name, Erice, in 1936. It occupies one of the oldest inhabited sites on the island; its castle stands on the site of a shrine that predates the Greeks. The town is 750 meters (nearly 2,500 feet) above sea level and has its own microclimate; often, Erice is enveloped in clouds while the neighboring port of Trapani, a mere 6 kilometers (less than 4 miles) away, basks in sunshine. But Trapani has an unhealthy setting, amid marshes, and this may have led settlers to choose the cooler climate of Erice. On a clear day, Africa is visible from Erice to those with sharp eyes.

Norman castle, Erice. Photograph courtesy of Christopher Kleinhenz.

Our knowledge of the town c. 1300 is especially detailed, because the notarial register of Giovanni Maiorana from this period, preserved in the state archives in Trapani, is rich in information about the life of Erice's Christians and Jews. The town still retains many medieval monuments, notably the cathedral (the *duomo*) and other churches, as well as a Norman castle. Its Franciscan and Dominican convents have become the base of a conference center (Centro Ettore Majorana) where regular study weeks devoted to medieval civilization are held.

The history of Monte San Giuliano begins afresh with the Norman conquest of Muslim Sicily. In 1077, Roger I, count of Sicily, besieged the hill town then called Jabal Hamid; the story is that he succeeded in capturing it only because he was helped by a pack of dogs led by Saint Julian, whose name was thereupon given to the settlement. In the twelfth century, the Granadan traveler Ibn Jubayr reported that the women of Erice were the most beautiful on the island. By then, the Muslims had been expelled from Erice, and Jubayr reports that for reasons of defense, the Christians would not allow any Muslims to set foot on the mountain; the Christians' view was that if Erice fell, the entire island would fall.

In the thirteenth century, Erice was providing Trapani with basic necessities and became a significant center of immigration. The

population of Erice had originated in Amalfi, Salerno, Naples, Apulia, Calabria, northern Italy, and even Catalonia; it also still included a significant Jewish group, who continued to speak Arabic and had their own *universitas*, or community organization, parallel to the *universitas* of the Christians. The Jews accounted for about 5 or 6 percent of the population as a whole, which was estimated at approximately 7,000 c. 1300, and were particularly involved in winemaking on the slopes of the mountain. Jews and Christians lived mixed together, although in the late fourteenth century a separate *giudecca* (ghetto) seems to have evolved; this *giudecca* was the scene of brutal forced conversions in 1392. The town appears by then to have been experiencing serious economic difficulties, and an appeal to King Martin I in 1407 emphasized the abandonment of properties by refugees from violence during the power struggles of the "four vicars" at the end of the fourteenth century. Without doubt, this depopulation was accentuated by pestilence from 1347 onward (though it is known that there were still 838 hearths in 1374). Generally, the town was renowned for its loyalty to the house of Barcelona after the Aragonese invasion of 1282.

Etna

Mount Etna, with an altitude of some 3,350 meters (10,990 feet), is the highest elevation in Sicily and the largest active volcano in Europe. It is a massif with subsidiary peaks, and on a clear day it can be seen easily from Calabria across the Strait of Messina. Its roughly oval base is about 212 kilometers (132 miles) around and covers an area of some 1,250 square kilometers (483 square miles). It is bounded on the east by a narrow coastal plain, on the north and west by the rivers Alcantara and Simeto, and on the south by the plain of Catania. Etna was famous in ancient literature as a spectacular instance of vulcanism; during the Middle Ages it was a topographical feature on and around which humans moved, a threat to inhabitants of the region, an object of scientific inquiry, and a place of supernatural and mythological significance.

Medieval Etna had several names. The traditional Greek Aitne and Latin Aetna or Etna were standard in the early Middle Ages and remained customary in learned writing throughout the period. Arabs called it Gebel (or, in a transliteration more closely approximating western Mediterranean pronunciations, Djebel) el-Nar, "mountain of fire"; the geographer al-Idrisi, writing under Roger II in the early 1150s, used this name for Vesuvius as well. From this name, or from an abbreviation, came the Latin names Gibellus and Gyber and the Italian Mongibello, whose first element also signifies a mountain; hence, too, the Latin analogue of Mongibello, Muntgibel, and the Greek Moukipelo. Although its adjacent plains had long been cultivated, and although there was a road system around it with towns of varying age at strategic points, the mountain itself was thickly wooded and thinly populated. The residents we know most about were monks and hermits, but brigands and others also found refuge here.

As early as the year 604, there was a monastery of Saint Vitus on Etna; the alleged improprieties of its inhabitants are the subject of two letters by Gregory the Great. The ruins of the "Cuba" of Santa Domenica near Castiglione di Sicilia and lesser remains elsewhere in the Alcantara valley indicate extensive monasticism in the vicinity during the period when it was under the rule of eastern Rome

(Byzantium). In the wake of the Norman conquest, settlement by the island's Greek minority expanded in this region, and by the early twelfth century Etna's slopes were dotted with hermitages and with monastic foundations practicing the Greek rite. Among these were the little church of Santa Maria di Maniace, established before 1105 to commemorate a victory by the eastern Roman general George Maniakes over Arab forces on Etna's northwest shoulder c. 1040; the monastery of San Nicola di Pelleria near Randazzo, attested to by a donation of the countess Adelaide (regent, 1101–1115); and the monastery near the cave in which Joachim of Fiore lived briefly after his return from the Holy Land in the late 1160s.

In time, these sites were either abandoned or taken over by the Latin church, which also created new ones. Santa Maria di Maniace, refounded in 1173 as a Benedictine abbey by the queen mother, Margaret of Navarre, is a striking example of Norman architecture. Many sites on the eastern and southern sides of Etna were said to have been destroyed by a violent eruption in 1329, but later foundations continued the tradition. One on the south side was the Benedictine abbey of San Nicola l'Arena, which was expanded from a Norman grange of the same name by Frederick III (1296–1337) and was famous as the final residence of his queen, Eleanor of Anjou (d. 1341). On the east slope near Milo, in the town forest of Mascali, was the chapel founded by John of Aragon (regent of Sicily, 1340–1348); John had a summer retreat next to this chapel, and he withdrew here in an unsuccessful attempt to avoid the black death. As the practice of designated forests (which included open areas) suggests, Etna's flanks were used, at least during the central and later Middle Ages, for woodcutting and for herding; locally felled timber supported shipbuilding at the arsenals in Mascali and Messina. The mountain also furnished foodstuffs: fungi, acorns, chestnuts, and—since its fauna was richer then than today—wild game. Ecclesiastical sites had territories of their own, often with associated villages: those of San Nicola l'Arena and, on the east side, the fourteenth-century priory of San Giacomo became today's Nicolosi and Zafferana Etnea.

How often Etna erupted during the Middle Ages is not known. Many eruptions are listed, but only those in 1329, 1333, 1381, and 1408—i.e., from later centuries when our sources are better—are historically

verifiable. The thirteenth-century *Prophecy of the Erythrean Sibyl*, parts of which are thought to be older and of Sicilian provenance, predicts that the end of the world will be heralded by a burning river coming from Etna; this prediction could have been based on an actual event, but again proof is lacking. The famous earthquake that leveled Catania in 1169 is now thought not to have originated in Etna. Etna is said to have shaken violently in 1285, after the death of Charles I. Arab sources indicate eruptions in the tenth and eleventh centuries. There may also have been events during the earlier medieval period. Versions of the legend of Saint Agatha, whose lost original (possibly sixth century) reflected perceptions current in its own time, recount how the citizens of Catania displayed the funeral veil of their new saint (supposedly in the year 252) and so protected the city from the advancing fires of Etna. The eighth-century Anglo-Saxon nun Huneberc of Heidenheim, narrating a pilgrimage to the Holy Land made by her contemporary Saint Willibald, reports that the custom then was to display the martyr's body; this, she says, will stop the flames immediately. In 1329, Agatha's relics were produced for this purpose— successfully, although the plain of Catania and much of the coast were devastated. Much the same happened in 1381, when a large lava flow ran right along the northern edge of the city.

There was very little scientific inquiry into volcanic phenomena during the Middle Ages, a time when nature was understood predominantly in terms of theology or of physical explanations that had been inherited, with few changes, from antiquity. In his *Encomium of Saint Agatha* (possibly c. 845) the Sicilian-born patriarch Methodius I quotes the patristic writer Gregory of Nazianzus to establish Etna's flowing lava as a marvel: its combination of characteristics associated with the contrary elements fire and water revealed Christ's unbounded power. In a long poem to Adela of Blois (after 1102), Baudri of Bourgueil lists Etna, in flames, among a number of divinely ordained natural wonders. Yet the lengthy praise of Sicily in the late eleventh-century *Life of Saint Philaretus the Younger* refers to the origin of Etna's fire and the manner of its eruptions purely as an unsolved scientific problem. This may have been merely rhetorical ornamentation in an ancient mode; but in Baghdad in the early twelfth century the learned Sicilian exile Abu al-Qasim ibn al-Hakim provided

details of Etna in eruption, some fabulous but others taken from actual observation (although not necessarily recent or his own). In the 1150s, Henry Aristippus, a Catanian cleric who was a figure at the Sicilian court, studied Etna's activity at close range; he also translated the part of Aristotle's *Meteorology* dealing with the liquefying and congealing of matter. Ristoro d'Arezzo's late thirteenth-century encyclopedia *The Composition of the World*, in its treatment of vulcanism, gives measurements of the length and breadth of one of Mongibello's lava flows.

The ancients, however, had explained volcanoes not only by reasoning from observation and analogy but also by myths of deities and their attendants at subterranean forges and of rebellious giants defeated in battle by the gods and punished by being imprisoned under fiery mountains. Ancient literary descriptions of Etna reflecting such polytheistic beliefs survived as models of style; and pagan concepts of a fiery underworld that could be entered through volcanoes or other sulphurous regions facilitated a medieval understanding of these places as portals to and from hell. Thus the very influential Isidore of Seville specifically identifies Etna as the biblical Gehenna; and the ninth-century Greek *Life of Leo, Bishop of Catania*, developing a theme from ancient Christian apologetics, observes of the ancient Greek philosopher Empedocles that the gods with whom he wished to speak when he insanely threw himself into Etna were really evil spirits. Thus, too, the Sicilian historian Nicola Speciale, whose partly eyewitness account of the eruption in 1329 bears comparison in some respects with Pliny the Younger's better-known account of Vesuvius in 79, records that after the event demons appeared on the mountain's slopes, assuming various forms and preaching frightful lies.

In the later Middle Ages, as Purgatory assumed an identity of its own in Christian belief, some people located it in Etna. But not all: when Caesarius of Heisterbach, a thirteenth-century writer of moral tales, has the now departed Duke Bertold V of Zaehringen (the rector of Burgundy and a former imperial candidate) sent to Mount Gyber, he specifies that this is hell and not Purgatory. When Caesarius lists volcanic mouths of hell in this tale (his third is Vulcano in the Eolian Islands, famous since Gregory the Great as a place of torment for the damned), he distinguishes Gyber from Etna; thus Etna's dual

nomenclature could have given it added prominence among symbolic mountains of the medieval European world. There is a story associating Etna with both Purgatory and Hell in Anonimo Fiorentino's late fourteenth-century commentary on Dante's *Divine Comedy*. At *Purgatorio* 3.115, where the subject is Constance, the daughter of Manfred, Constance is said to have visited a holy hermit living on a mountain near Mongibello (the location is significant) and to have asked him to inquire of God whether her father, who had been an enemy of the church, were indeed damned; the hermit did so and then announced God's revelation that Manfred was among the elect in Purgatory.

If Etna was a place of the afterlife, then it could also be the ongoing residence of famous people who had disappeared from mortal sight. In the early thirteenth century, Gervase of Tilbury, an Englishman with experience in Sicily under William II, told a story centering on King Arthur, recently seen living perpetually in a palace on Muntgibel and suffering from a wound that never healed. Gervase's tale is evidently related to the legend of Arthur in Avalon and is probably connected with other Arthurian events and legends from the same general area (Richard I's presentation of Excalibur to King Tancred in 1191; the naming of the veil of mist in the Strait of Messina after Morgan le Fay, in Italian *la Fata Morgana*). This tale also had an Italian offshoot, a Tuscan poem of the Gatto Lupesco. Versions from elsewhere in Europe added clearly diabolical and punitive elements; other late medieval fiction explicitly located Morgan too at Etna. In different fashions, the idea was soon adapted for Frederick II, who had just died—both by his enemies and by those for whom his image was more positive. In 1258, Franciscan Joachites who saw Frederick as the Antichrist developed a fable in which he rode toward Etna with 5,000 horsemen in hellish armor. In 1261, the first of several false Fredericks, a ne'er-do-well from the territory of Adrano, took up residence on nearby Etna in furtherance of his claim. Only later did Germans place their Italian-born emperor in Thuringia's Kyffhaeuser mountains.

Eudocia was the elder daughter of the emperor Valentinian III (r. 425-455) and his wife Licinia Eudoxia. She was betrothed to Huneric, the son of the Vandal king Gaiseric (Genseric, r. 428-477), apparently in the early 440s. In spite of this, after Valentinian was murdered in 455 she was married to Palladius, the son of the short-lived emperor Petronius Maximus. When the Vandals sacked Rome in the same year, she was carried off to Carthage along with her mother and her sister, Placidia. There, the marriage to Huneric was consummated. She became the mother of the later Vandal king Hilderic (r. 523-530).

Eudoxia

Licinia Eudoxia (b. 422) was the daughter of the eastern emperor Theodosius II (408-450) and Aelia Eudoxia. In 424 she was betrothed to the western emperor Valentinian III (r. 425-455), and the marriage was performed in Constantinople in 437. She bore two children, Eudocia and Placidia. She received the title *augusta* ("empress") in 439. In 455, after Valentinian was murdered in Rome, she was compelled to marry his successor Petronius Maximus; later, it was said that she invited the Vandal Gaiseric (Genseric) to Rome in the same year. After the ensuing sack, she and her two daughters were carried back to Carthage. Not until the early 460s were she and Placidia set free; they withdrew to

Constantinople, where Eudoxia spent the remainder of her years. Eudocia remained in Africa as the wife of Gaiseric's son Huneric.

Eugenius III, Pope

Eugenius or Eugene III (Bernardo Paganelli, Bernard of Pisa; d. 8 July 1153) was the first Cistercian pope. He initially became vicedominus of the Pisan church (administrator of church possessions). After meeting Bernard of Clairvaux in 1135, he became a Cistercian monk at Clairvaux. By 1142, he returned to Italy as the abbot of Tre Fontane. He was appointed to the College of Cardinals, and he was elected to the papacy on 15 February 1145.

Eugenius was a crusading pope. He initiated and organized the Second Crusade (1148) with expeditions to the Christian east, Spain, and Germany. Exiled for much of his reign by the antipapal Roman commune, he also led campaigns for the recapture of Rome and other lands for the patrimony of Saint Peter. These campaigns, aided by Norman Sicily, secured the defeat of the commune, establishing the pope's temporal authority over his episcopal city.

Although not a canonist, Eugenius was in many regards the first

lawyer-pope. He spent hours hearing and trying cases at the papal court, issued an unprecedented number of decretals, convened two papal consistories (Paris, Reims), and was the architect of one of the chief arms of the papal judicial system: papal judges-delegate. He also presided over three councils in 1148 (Trier, Reims, and Cremona). Through these activities Eugenius sought to further the Gregorian reform: *libertas ecclesiae* (freedom of the church from lay control), the moral reform of the clergy, and the primacy of Rome over all churches.

The majority of Eugenius's papal letters have been edited in several collections: *Patrologia Latina* (180), *Acta Pontificum Romanorum Inedita*, and the *Papsturkunden* series; see also Jaffé (1885-1888). For Eugenius's activities as the Pisan vicedominus, see *Regestum Pisanum* (1938). Two letters have survived from Eugenius's tenure as abbot (*Patrologia Latina*, 182).

Eugenius of Palermo

Etugenius of Palermo (c. 1130-c. 1202) was a highly placed official, an accomplished poet, and a translator of scientific and literary works. He

facilitated east-west cultural transmission in the kingdom of Sicily when it was still significantly polyglot.

Eugenius was a member of the Italian-Greek nobility that had filled important positions since the early days of Norman rule; he was the son, nephew, and grandson of officials who had attained the rank of admiral, or *emir*—a title that was not exclusively naval—and whose work must have required a knowledge of Arabic. From 1174 to 1190, Eugenius served as master of the *duana baronum*, a royal financial office, then based in Salerno, for the mainland part of the kingdom. Eugenius himself was made an admiral in 1190 by the newly crowned king, Tancred; he was a major figure at the court in Palermo during the reigns of Tancred and Tancred's immediate successor, William III. Along with others close to William, Eugenius was arrested at the end of 1194; he was charged with conspiracy against Henry VI and was imprisoned in southern Germany. By July 1196, however, he was back in the kingdom and was serving, in Apulia and without the title of admiral, as a senior subordinate of the imperial legate Conrad of Querfurt. He may also have been the Eugenius who was master chamberlain for Apulia and Terra di Lavoro from 1198 to at least 1202; this is less certain but is usually accepted. The date of his death is unknown.

Eugenius's multilingualism bore considerable fruit. He is assumed to be the Eugenius who assisted the author of the first Latin translation (c. 1159) of Ptolemy's *Almagest*, an astronomical text transmitted in Greek and Arabic manuscripts; his fluency in all three tongues is noted in the translator's acknowledgment. His own Latin translation of Ptolemy's *Optics* from its Arabic version (the original Greek is lost), which seems to have been contemporary with the translation of the *Almagest*, was used by Roger Bacon in the thirteenth century and survives in more than a dozen manuscripts. Eugenius's Latin translation of the cryptic *Prophecy of the Erythrean Sibyl* from Greek is now known only through its very popular thirteenth-century Joachite reworking by John of Parma or an associate, but significant portions of this apocalyptic text are believed to belong to Eugenius's original. Eugenius also prepared or at least commissioned, probably during his later years at court, an edition of the Greek "mirror of princes" *Stephanites and Ichneutes*, itself a translation of the Arabic

Kalila wa-Dimna (selections from the Indian *Panchatantra* or *Fables of Bidpat*).

Eugenius is the front rank of the Greek poets of medieval Italy. From his larger production, twenty-four poems survive, preserved in a single fourteenth-century manuscript written at the famous monastery of San Nicola at Casole near Otranto. These poems are in metrically careful twelve-syllable iambics; some are epigrams, but most are longer reflections on ethics and other aspects of the human condition. The two longest and best-known are the first and last: *When he was in prison* (number 1, in 207 lines) and *To the most renowned and trophy-holding king William* (number 24, in 102 lines, a panegyric probably addressed to William I). Other noteworthy pieces include an elegant description of a locally common water lily (number 10); a derogatory rejoinder to the ancient satirist Lucian's *Praise of the Fly* (number 15); and the mildly didactic *On kingship*, perhaps written for the young William III (number 21).

In the unique copy of Peter of Eboli's *Liber ad honorem Angus ti*, the caption to a group portrait of the alleged conspirators of December 1194 names Eugenius, among others. But more names are listed than there are faces in the illustration, and it is not clear which if any of those depicted is meant to be Eugenius. Specimens of his signature survive in official documents. A modern scholarly attribution to Eugenius of the writings of his now anonymous contemporary, called Hugo Falcandus, has found little favor.

Eusebius

Eusebius (Eusebius of Vercelli, saint, d. 1 August 371) was born in Sardinia and was educated and ordained as a lector in Rome. Subsequently, he served as the first bishop of the church in Vercelli. Eusebius was the earliest bishop in the west to unite monastic and clerical life; he is also regarded as one of the foremost defenders of Saint Athanasius and orthodoxy against the heterodox Arians. His surviving work includes three brief letters, and Saint Jerome also attributes to Eusebius a Latin translation of Eusebius of Caesarea's commentary on the Psalms, which is no longer extant. Previously, scholars ascribed the *Codex Vercellensis* to him, although this attribution is controversial.

Eustace of Matera

Eustace (Eustachius, Eustasius; thirteenth century) of Matera, an Apulian, was a judge at Venosa and a partisan of the Swabian monarchy in the kingdom of Sicily. He was exiled by the new Angevin regime in late 1269 or early 1270, and during the year 1270-1271 he composed a long Latin poem in elegiac distichs, *Planctus Italie* (*Italy's Laments*), detailing the fate of various cities in Sicily and elsewhere in Italy. In this work, Eustace used artful rhetoric and traditional elements of praise of cities. *Planctus Italie* was known to Dionigi of Borgo San Sepolcro and to Paul of Perugia; through the latter, it became one source of Boccaccio's antiquarian learning. Evidently, *Planctus Italie* extended to as many as fourteen books, but today it is preserved only in fragments. The longest extant fragment deals with the sack of Po tenza following its unsuccessful revolt in 1269. Other surviving passages provide topographic information, mention local crops and other products, and give etymologies for the names of cities and regions.

By the early fifteenth century Eustace was also considered the author of an anonymously transmitted work, *De balneis Puteolanis*, which is not entirely dissimilar to *Planctus Italic*. However, *De balneis* is now assigned to Peter of Eboli.

Exarchate of Ravenna

Exarchate of Ravenna was the name given to the Byzantine government, or regime, with its seat in Ravenna, that was developed between the completion of Emperor Justinian's reconquest of Italy and the fall of Ravenna to the Lombards in 751.

The concept seems to have developed in the decades following Justinian's death (565), at a time when the two major areas reconquered by imperial forces were seen as in continuing peril: North Africa, retaken from the Moors and Berbers; and Italy, retaken from the Lombards. There was a precedent for the exarchate, since Justinian had given extraordinary powers to certain commanders, such as Belisarius and Narses. The traditions established earlier under Diocletian and Constantine had decreed a strict separation of military and civil powers in individual offices; but in a break with this tradition, Belisarius and Narses were given comprehensive authority not only to command troops but also to preside over administrative and judicial functions.

The title *exarch*—literally, "ruler outside," or beyond the frontiers—is perhaps closest to the modern titles viceroy and governor-general. Just when it was framed or when it began to be used is not clear; some scholars think that this occurred at the time of the Lombard invasions in 568, but in any case the title seems to have been in general use by the last decades of the sixth century. At that time, the eastern Roman, or Byzantine, empire was fighting to survive, specifically in the east: the western territories were considered remote, somewhat alien, and all but supplemental rather than integral parts of the empire. Emperor Maurice (582-602) is sometimes credited with having explicitly created the two *exarchates* (first mentioned in documents in 584), and some scholars have seen them as prototypes for the form of military redistricting, the *themes*, applied to the territories of the empire's heartland in the seventh century.

The African *exarchate* was identified with its seat in Carthage, and the Italian *exarchate* was, in the same way, clearly tied to the continuance of Ravenna as the functioning capital of Italy. The enclave around Ravenna held out, alone, against the Lombard tide that had engulfed the rest of northern Italy and even parts of the center. Although the term *esarcato* came to refer geographically to the region immediately around Ravenna, the power of the *exarchate* extended through the southern regions of Italy remaining in Byzantine hands. Rome itself remained imperial, if sometimes precariously; its government was directly under the popes, but the popes were considered subjects of the emperor and therefore theoretically dependant on the *exarch*, who was directly responsible only to the sovereign in Constantinople. At times, when popes were disobedient, the *exarchs* were ordered to chasten them, as in the case of Pope Martin I. Conversely, several *exarchs* rebelled against Constantinople. While there are gaps in our knowledge of the holders of this office, we know of the names of some twenty incumbents.

The *exarchs* could do little against their sometimes aggressive Lombard neighbors; and when the resurgent Lombard forces of Aistulf seized Ravenna in 751, no attempt was made to reconstitute the *exarchate* in the imperial territories of southern Italy, which were organized instead as *themes* and were eventually brought together under a supreme official called the *katepan*.

Ezzelino III Da Romano

Ezzelino III da Romano (25 April 1194-1259), the son of Ezzelino II of Monaco, was a member of the Italian aristocracy, a military leader, and a governor who eventually became lord of Verona, Vicenza, and Padua. When Ezzeiino III entered into his inheritance, the Trevisan March was politically unstable and awash in blood feuds, a situation that Ezzeiino used to his advantage. In 1225, in an alliance with some local families, he seized control of Verona; in 1226, he was made *podestà*. In the next few years Ezzeiino allied himself with the Lombard League, which resisted the attempt by Emperor Frederick II to subdue the northern Italian communes. Ultimately, however, Ezzeiino was forced to resign as *podestà*; and as the Lombard League came to favor a faction opposed to him, he turned to Frederick for support. Ezzeiino recaptured Verona in 1232; in 1236, when the emperor sent military reinforcements to aid him, Ezzeiino also conquered Vicenza and Padua. In 1237, he helped the

emperor defeat the Lombard League at Cortenuova. For the next twenty years, Ezzeiino was the most powerful force in the March, often maintaining his authority and imposing his will through brute force. He cemented his alliance with the emperor in 1238 when he married Frederick's illegitimate daughter Selvaggia.

Ezzelino had formed his alliance with the emperor not because of any ideological adherence to the Ghibelline cause but because he perceived, correctly, that this alliance would favor his own interests. Likewise, he was not attracted to titles and typically did not hold office in the communes he controlled, preferring instead to act as a party leader, manipulating the councils of the cities to achieve his purposes. By the time of Frederick's death in 1250, Ezzelino was in a position to survive in power without the emperor's support. In 1254, however, Pope Innocent IV declared Ezzelino and his northern Italian ally Uberto Pelavicini heretics, excommunicated them, and launched a crusade to oust them from power. Ezzelino was in all likelihood not a heretic, as he seems to have evinced little interest in religious matters except as they constituted a threat or an aid to his own power. After Innocent died, his successor, Pope Alexander IV, continued the crusade and enlisted the Venetians, who were wary of Ezzelino's power and proximity. Pelavicini suddenly left Ezzelino and made an alliance with the papal forces. Ezzelino was captured at the battle of Cassano in 1259, and he died in captivity shortly thereafter, reportedly after refusing food and medical attention.

Ezzelino was legendary for his cruelty and became a symbol of the ferocious tyrant, especially to his Guelf enemies. The Guelfs' propaganda painted him as inhuman; Giovanni Villani, for example, wrote that he "was the most cruel and feared tyrant that ever existed among Christians." Salimbene of Parma wrote that Ezzelino "was truly of the body of the devil and a son of iniquity. . . . He was the worst man in the world." While most scholars now believe that the Guelfs' portrayal was exaggerated, they do not doubt Ezzelino's willingness to resort to force, intimidation, and cruelty in order to achieve his ends. Ezzelino, however, was very much a man of his time, ably using the factions of Italian politics and the communal system of government in northern Italy in his determined pursuit of power.

Fabliaux in Italy

Fabliaux found their way into Italy in the mid-fourteenth century through two parallel genres: the novella (in Italian, *novella*, *novelle*) and the *cantare*. Traces of fabliaux may also be found in Boccaccio's *Decameron*, which is in fact widely indebted to the fabliaux tradition. For example, there is a very close correlation between *Decameron* 9.6 (the tale of the misplaced cradle) and a French fabliau transmitted in at least two versions: *Le meunier et les deus clers* and *Gombert et les deus clers*. The first part of *Decameron* 2.5 (Andreuccio da Perugia) closely resembles *Boivin de Provins*. Other novellas in *Decameron* that center on themes also found in fabliaux are: 7.5, which is reminiscent of *Le chevalier qui fist sa dame confesser*, 7.7, concerning a woman who has her husband beaten up as an unwanted suitor while she receives her lover, as in the fabliaux *La borgoise d'Orliens* (with its variant *De la dame qui fist battre son mart*) and *Un chivalier et sa dame et un clerc*, 7.8 (about an unfaithful wife who puts another woman in her place to suffer the husband's punishment), which is close to the fabliau *Les tresces* and its variants; and 3.8 (the tale of Ferondo, a gullible husband who believes he is dead), which is reminiscent of *Le vilain de Bailluel*. Still other connections have been identified—for instance, by Michelangelo Picone—but these seem less strong and pertain more to intercultural than to intertextual relations.

II novelliere by Giovanni Sercambi, compiled at the turn of the fourteenth century, also used stories from the fabliaux tradition: *Exemplum* 10 (*De visio luxurie in prelatis*) has antecedents in the fabliaux of "Estormi" and *les quatre prestres*, and *exemplum* 11 (*De vituperio pietatis*) has antecedents in *Constant du Hamel*. *Exemplum* 15 (*De ventura in matto*) is based on the French tale *Grillet* included in the *Contes du Sieur d'Ouille*, which in turn is an elaboration of the fabliau *Le vilain mire*. The tradition of *les quatre prestres* continued in Italy as

late as the sixteenth century, finding its way into one of Bandello's *Novelle* (3.43).

The fabliau *Constant du Hamel* is also represented, in the *cantare* tradition, by the rendering of *Due preti e un chierico innamorati d'una donna* (*Two priests and a clerk in love with a woman*), a *cantare* handed down in a fifteenth-century manuscript. The often reelaborated fabliau of "Auberee" is the origin of the fourteenth-century *cantare* *Il calonaco di Siena* (*The canon of Siena*)-, and *La canzone dello indovinello* (*The Song of the Little Diviner*)—which may be the same as the *canzone* mentioned among the readings of the widow in Boccaccio's *Corbaccio*—is yet another rendering of a story found in several fabliaux whose theme is described by the title of one of them: *La damoisele qui ne pooit oir parler de foutre*. In fact, *Canzone dello indovinello* combines the first part of *Cele qui jut foutue et desfoutue* (also known as *De la grue*) with the motif, appearing in *La damoisele*, . and its variations (for example *L'esquiriell*), of finding an appropriate metaphor to persuade a girl to give refuge to the male lover's *indovinello* (*Decameron* 3.10 provides a parallel version of this motif).

Neither the Boccaccian *novella* with its multifaceted meanings nor the *cantare* with its stanzaic formal structure was, however, apt to reproduce the typical *pointe* where the French fabliau reached its climax and released the *vis comica* (comic force) of the genre. Even when the stories were recognizably the same, the fabliau lost its generic characteristics in Italy. It may be surmised that fabliaux stories reached Italy mostly through oral circulation and were thus immediately translated into the genres that distinguish the Italian literary tradition.

Fabriano

Fabriano is situated on the knees of the Apennines, at an altitude of more than 1,000 feet (about 300 meters), 44 miles (70 kilometers) inland from and southwest of Ancona. During the Middle Ages, the little town of Fabriano was important for two reasons.

First, an artistic school nourished here in the 1300s and 1400s. Its most noted master was Allegretto Nuzi (1308-1385), some of whose works still adorn local churches. Nuzi may have been the early teacher of Gentile da Fabriano (c. 1370-c. 1450), but none of the latter's work survives in the town. Gentile da Fabriano's career took him to Florence, possibly to study with Fra Angelico; and then to Venice, where in 1411 he received a commission to create the frescoes in the great hall of the doge's palace. After this, his reputation spread widely and he worked throughout Italy, including Rome and Florence.

Second, Fabriano was important in the later Middle Ages as the place where the paper industry took hold in Europe. Fabriano was in an ideal location to foster the paper industry. There was a steady supply of water which had enough head to drive many industrial operations and which, because of its origin in limestone mountains, was clean and

clear, especially as it entered the town. In the thirteenth and fourteenth centuries, Fabriano was also famous for its tanneries; it thus had a ready source of gelatin from boiled animal skins and bones.

Exactly when the technique of papermaking was transmitted and what path this transmission took are uncertain—the technique may have come from Xatavia in Muslim Spain or directly from the Levant—but in any case the papermaking industry began in Fabriano c. 1270. The citizens of Fabriano certainly did not invent the idea of stamping cotton or linen fabrics in order to break up the fibers for use, and they may not have introduced the innovations of using water power to drive the stampers or watermarks to identify the manufacturer; but they probably were the innovators in the use of animal gelatin for sizing the paper. A combination of resources and people who recognized the potential of this industry made Fabriano the base from which the industry spread. In 1283, Fabriano had two paper mills. By 1324, six masters were working in the town, and by 1330 this number had increased to twenty. Fourteen registers containing paper merchants' records from 1360 to 1580 show that the stock was sold as far afield as Rome and Venice. Even though Venice had its own mills at Treviso, paper from Fabriano was the favorite brand handled by Venetian merchants trading in the western Mediterranean. Fabriano's craftsmen were largely responsible for the spread of the industry throughout Italy and into France and Germany, especially in the last quarter of the fourteenth century after the development of wire-drawing techniques allowed significant advances in making high-quality forms. In the fifteenth century, civic officials tried to stop the spread of the town's industrial secrets by passing legislation that limited the right of paper workers to move away.

to this day, Fabriano retains its reputation as a premier paper-producing center.

Faenza

Faenza is southeast of Bologna, between Imola and Forlì, on the banks of the Lamone River; it is situated in the Romagna-Ravennate plain and on the main north-south road, Via Emilia. One of its most famous products bears its name: faience, a type of glazed pottery or majolica ware.

Faenza was probably first settled by the Etruscans; it became a Roman town, Faventia, in 225 B.C. Throughout most of the early medieval period, Faenza was constantly at war with the nearby cities of Imola, Bologna, Forlì, and Ravenna. One battle was particularly fierce: in 1138, the troops of Faenza, together with those of Bologna, fought against the armies of Imola and Ravenna, and the little stream that ran beside the battlefield became known as Rio Sanguinario—the "bloody river." The first mention of a popular government occurs in 1141, and the first *podestà* (podesta) was installed in 1155. Emperor Frederick I Barbarossa resided in Faenza in 1167, but in 1178 the town joined the anti-imperial Lombard League. In 1218, the people of the city formed a

comunanza delle armi (community of arms), through which they were allowed to participate in the government. In 1226, Faenza joined the Second Lombard League; however, the victory of Frederick II in the battle of Cortenuova (1237) encouraged Ghibelline families in the city, notably the Accarisi, to rise up and expel the Guelfs—in particular, the Manfredi family, who nevertheless almost immediately regained power. In response, Frederick II besieged and eventually occupied the city (1241). After more than half a century of civic strife the Manfredi achieved a final victory in 1313; thereafter, they continued in power for almost 200 years, although there were some periods of papal rule. Faenza was sacked in 1361 by the *condottiere* Sir John Hawkwood in the service of the pope; the town was then entrusted to the rule of Astorgio Manfredi, to whom the pope gave the title "vicar for the church." The Florentine author Franco Sacchetti (c. 1330-1400) was *podesta* of Faenza and in this capacity was a member of Astorgio's court. The rule of the Manfredi family came to an end in 1501, when Cesare Borgia captured the city and exiled Astorgio III, who was slain in Rome in 1502.

One of Faenza's distinctive features is its elliptical plan, with the two main roads, the *cardo* and the *decumanus*, crossing at the center—a formula reflecting the design of Roman military camps. The four quarters of the city became identified with certain characteristics and with colors representing each quadrant (red for the north, green for the west, yellow for the south, and black for the east). A twelfth-century wall encloses the ancient rectangular *castrum* (garrison town). Among the medieval buildings are the Palazzo del Podestà, begun in 1177 and expanded in 1256; and the Palazzo del Municipio or town hall (the former Palazzo del Popolo), constructed in the last quarter of the thirteenth century. The church of San Francesco, founded in 1271, was completely redone in the eighteenth century. There is an interesting tenth-century crypt in the church of saints Ippolito and Lorenzo. The Romanesque church of San Bartolomeo, of ancient origin, was rebuilt in 1209 and restored in the twentieth century. Just outside the city is the church of Santa Maria Vecchia (formerly Santa Maria foris Portam); although this church was entirely rebuilt in the seventeenth century, it still has an octagonal bell tower dating from the tenth century.

Faenza is most famous for its earthenware and glazing. From the thirteenth century on, faience emerged as an important art and craft. In

its initial phase, this pottery followed the form of ancient Greek *oinochoë* (bulbous pitchers with a pinched spout); but there were also other, simpler forms—bowls, plates, platters, and drinking cups—all decorated in relatively plain but colorful geometric designs. Unlike ancient pottery, faience was completely glazed. This glazing sealed the interior and the exterior and thereby increased the area that could receive decoration, provided a food container that could be cleaned and reused for a variety of purposes, and allowed materials to be stored safely for longer periods. In the late thirteenth and fourteenth centuries, faience was richly decorated with animal and plant motifs and occasional human figures, so that it served aesthetic as well as practical ends.

Falier, Marino

Marino Falier (1274-1355) was doge of Venice from 11 September 1354 until his execution on 17 April 1355. He had plotted to destroy the Venetian republic so that he could become its despot, and when his conspiracy was betrayed, the Council of Ten ordered him to be beheaded. Before his election as doge, Falier, who had been born into the highest Venetian nobility, was a member of the Council of Ten, an ambassador to the pope, and a successful naval commander, and he had amassed a large fortune in real estate. His fellow conspirators included men of the bourgeoisie who blamed the nobility for Venice's losses in its third war with Genoa (1350–1355). Aristocratic, not bourgeois, commanders had been responsible for defeats suffered by the Venetian navy, especially a defeat at Porto Longo on 4 November 1354.

During Falier's brief reign as doge, the Visconti of Milan, who were lords of Genoa, sent Petrarch to Venice to negotiate peace. Commenting on these difficult negotiations, Petrarch remarked, "It is necessary that one or the other of Italy's eyes should be put out, the other dimmed." Later chroniclers attributed Falier's conspiracy to his resentment against the noble majority in the Venetian courts, who had not adequately punished Michele Sten for insulting the *dogaresa*. Sten had attached to the ducal throne the following lampoon: "Marin Falier with the beautiful wife; others enjoy her and he maintains her." Falier, who was already past the age of seventy when he was elected doge, had been married a second time to Aluica Gradenigo, granddaughter of a doge and herself almost fifty years old.

Falier was the last doge who seriously attempted to overthrow the Venetian republic. His portrait in the Hall of the Great Council was replaced with the inscription: "Here is the place where Ser Marin Falier

was beheaded for criminal acts."

Family Structure

At birth, medieval Italians joined many interlocking and interrelated family groups. They joined a conjugal, or nuclear, family, which included father, mother, and other children. They joined a household, which included the conjugal family and all others, relatives and servants, living together under the same roof. They joined a family clan, or lineage, which included blood relatives linked to a common paternal ancestor. They also joined a wider kinship group, which included the

family clan, maternal relatives, and affinal kin, or relatives through marriage. Italian family structure in the Middle Ages therefore consisted of a number of levels. For the average person, the most important level was the conjugal family; within this unit, Italians formed the closest emotional bonds and defined what for them was their private life.

Defining medieval Italian family structure is difficult. The period from 300 to 1400 represents the chronological passage of a number of distinct cultures—Roman, tribal German, urban and rural Italian—all of which had their own versions of family structure and private life. Each of these cultures adopted and adapted ideas and customs from its predecessors. The Christian church adopted its own version of family life, based on its interaction with these cultures and its own view of what the family should be—a view in turn based on the Holy Family. Medieval Italian family structure and private life were also influenced by other cultures: Byzantine, Muslim, and Norman. It is not surprising that Emperor Frederick II (1194 or 1195–1250) was the wonder of the world to his contemporaries, since all these influences were blended in him.

Demographic fluctuations affected medieval Italian family structure. From c. 300 to 700 there was a decline in population in Italy, and a migration of German tribes. The family was small. From c. 700 to 1000 the population remained stable, becoming quite dense in some areas yet at the same time being limited by the effects of war, famine, and disease. From c. 1000 to 1200, because of an expansion of agriculture and the commercial revolution, the population increased dramatically, as did family size. The Hauteville family, for instance, contributed eight of twelve brothers to the Norman conquest of southern Italy. From c. 1200 to 1340 the population continued to increase, though at a slower rate than before. Then, between 1340 and 1410, the population fell drastically—according to some estimates, by one-third to two-thirds—largely owing to the effects of the black death. Within a single season, some families disappeared. The Sienese chronicler Agnolo di Tura recorded that in 1348 he buried his five children with his own hands. Florence had approximately 120,000 inhabitants in 1338; in 1427 it had only 40,000. At Prato in 1298 each household had, on average, 5.6 people; in 1427 it had only five. During the late Middle Ages in Italy,

family structure was so seriously threatened by war, famine, and especially disease that many people feared for the survival of their conjugal family and their lineage.

Although demographic fluctuation and the melding of cultures over time make it difficult to define medieval Italian family structure adequately, some general trends and similarities can be identified from late antiquity to the Renaissance. Just as the family was the basic social unit of the Roman world, so it was for the medieval Italian world.

The Roman family was a tightly woven unit headed by the *paterfamilias*. It was also a complex unit, since Roman law had developed elaborate concepts regarding kinship, marriage, divorce, and inheritance. As defined by law, the *paterfamilias* was the oldest living male in a family, and he held considerable power, even that of life and death, over his wife, children, and slaves. In theory, as long as he was alive, his adult children had to obey his desires, including his choice of mates for them. However, in reality a *paterfamilias* consulted with other male family members about matters crucial to the family, such as marriages; and the *paterfamilias* was rarely as dictatorial or powerful as the law permitted him to be.

As the emphasis on the *paterfamilias* indicates, descent in the Roman family was agnatic. Nevertheless, in practice women had considerable freedom to dispose of their own property, and daughters did inherit. Women, though barred from public office, could and did wield considerable influence, especially within and through the household.

Despite its patriarchal nature, the conjugal family was close and affectionate. In general, Roman men married late in life, though they usually married women considerably younger than themselves. The conjugal family was small: the average for both the rich and the poor was about three surviving children per family. A Roman household, though, could be enlarged by the addition of slaves. The lineage and kinship group, while important for inheritance and social support, had few public roles, since the elaborate Roman state fulfilled these.

Although the German invaders eliminated much of the Roman state, they fused two societies into one. And just as in Roman society, an affectionate conjugal family was the foundation of German—particularly Lombard—society in Italy.

Among the Germans, marriage represented a woman's transition

from the protection and control of her birth family to that of her husband. Marriage was a contract between the bridegroom (sometimes with his male relatives) and the bride's male relatives. In 731 a Lombard law stated that the legal age of marriage was eighteen; Roman law had made twenty-five the legal age. For the Germans, marriage involved a considerable exchange of gifts between the two families. The new husband gave a bride price to his wife's father; the father gave something to the couple; the husband gave a *Morgengabe*, or morning gift, to his new wife, and he provided the dowry, which could be one-fourth to one-third of his property. Since consummation was the defining characteristic of a marriage, the presentation of the *Morgengabe* to the bride represented that the contract had been fulfilled.

Although among the Lombards the head of a conjugal family had legal control over his wife and children, his power was less than that of the Roman *paterfamilias*. When his sons reached age eighteen, they were free from his control. He could put his wife aside for committing adultery or for plotting against his life; but if he wanted to divorce her for any other reason, he had to pay a fine, and he lost all rights of control over her.

Under German law, inheritance was partible, being equally divided among the sons. Although by law women had to be under the authority of some male relative, they could inherit property on their own. A legitimate daughter even had rights to one-third of her father's possessions when only illegitimate sons survived; later Lombard law gave daughters rights to all the property over illegitimate sons.

Lombard kinship recognized descent from both the male and the female line. The average family could trace its lineage back for four generations, and some families could trace their lineage back for seven. This represents a situation in which at least fifty current families could define themselves as belonging to a single kinship group, the *fara*—a term which appears as late as the twelfth century. Originally the *fara* was a group of families organized for war, but eventually these families settled in the same area; held property in common; and, because of the decline of the state, adopted public roles for themselves, including adjudicating disputes and avenging wrongs.

Perhaps the most essential public role of the family was maintaining

peace through the vendetta. A family had the right to wreak revenge for wrongs done to one of its members. As the state evolved, it tried to moderate this practice by having the transgressor pay money to the victimized family in lieu of letting victims exact a physical penalty. In addition, the family compelled others to come to court and provided "oath helpers" for its own members when they appeared in court.

Over time, medieval Italy developed a complex urban society. Family structure reflected this complexity, although the simple, affectionate conjugal family predominated over the interests of the larger family levels: household, lineage, and kinship. Marriages were usually planned by kin, especially fathers. Men married late, and (like the Romans) they married women considerably younger than themselves. In Florence the average difference in ages between spouses was twelve years; in Verona it was seven. In Florence the average bride was about seventeen years old and the average bridegroom twenty-nine. Through the influence of the church, marriage came to be defined as the consent of the couple who were marrying, not as the consummation of the marriage; this new definition may have weakened the family's influence. The gifts involved in communal marriage had changed as well. To emphasize the lineage, communes limited the wife's claim to the husband's property and his gifts to her; and with the reintroduction of Roman law, the dowry regained its classical sense of the wife's contribution to the marriage. In fact, the dowry was emphasized so strongly that a sizable dowry became a requisite for a good match. By the thirteenth century the value of dowries had soared—to the despair of families seeking suitable matches for their daughters. The dowry was so serious that in 1425 Florence instituted a state fund for investment in dowry futures. The demographic crises of the late Middle Ages also altered marital patterns by decreasing the age of marriage and increasing the number of those who married.

The high infant mortality rates and episodes of the plague in the late Middle Ages especially threatened family structure. Because of the age difference between husbands and wives, widows outnumbered widowers in Italian urban society. In Florence, almost half of the women age forty and older were widows. Also, because of late marriages and high death rates many young people grew up without a father. Another effect was that there was considerable remarriage,

although this was an option taken up more often by men than by women. A will typically specified that the testator, the husband, expected his wife not to remarry after his death; the purpose of this stricture was to protect the welfare of their children and, indirectly, their lineage. However, in medieval urban contexts a will focused more on the interests of the conjugal family than on those of the lineage or kinship group. Such wills, along with pious donations for deceased family members, are evidence of a high level of family affection. Moreover, the practice of prayers for the dead indicates that family ties crossed the boundary between the dead and the living—an idea that grew stronger as the concept of Purgatory evolved and became fixed in the popular imagination.

Following the Roman and German legacy, inheritance in a medieval Italian family was partible and male-based; property, especially in the aristocracy, rarely left the lineage. Sometimes a lineage would even hold property, such as a defensive tower, in common. As a result of these practices, and of Roman legal concepts regarding the *paterfamilias*, the urban Italian family was patriarchal; but a wife had considerable authority over her household and her children, and a widow had considerable control over her property.

Households could be large, since the surest way to guarantee the continuity of the lineage was to produce numerous heirs. Some families, especially elite families, had swarms of children; Gregorio Dati, for instance, was one of seventeen children. The presence of servants, who accounted for perhaps 10 percent of the general population, also ensured large households. Sometimes sons brought their own families to live in the household of their birth; and at times a household represented a joint venture by two brothers. Thus extended families were not unknown, although the extended family was less common than the nuclear family and was more a rural than an urban phenomenon. An extended family represented a stage in the history of a particular family rather than a stage in the evolution of family structure in general.

Thus the history of Italian family structure provides no support for the theory of progressive "nuclearization" as a defining characteristic of the modern family. The nuclear family was always the cornerstone of family structure, although the household, lineage, and kinship group

also played significant roles.
